The Sarnia Match Co. will at once commence building a factory that will employ 300 hands.

Victoria, B.C., is having $9,000 worth of electrical machinery installed in its new power house.

The Great West Power & Machinery Co. have been organized to build a gas works at Winnipeg.

J. R. Gillis, Arnprior, Ont., has placed an order with the Robb Engineering Co. for a 150 H.P. engine.

The Seaman-Kent Co., of Meaford, lost their dry kilns by fire, together with 100,000 feet of lumber.

The Toronto & Hamilton Sewer Pipe Co. had their Hamilton works destroyed by fire. Loss $25,000.

A discovery of an 85-foot vein of copper is reported on the Judge-Jumble mine in Cobalt district.

W. J. Ireland, architect, of Stratford, is making plans for a three-storey apartment house in that city.

It is reported that American capitalists will erect a large flax mill at a point in Saskatchewan.

The Maple Leaf Milling Company will erect a large mill and elevator at Kenora, Ont. Work will be commenced May 1.

Shurly & Dietrich, of Galt, will enlarge their plant by the addition of a warehouse 130 by 50 feet.

The St. Catharines Building & Paving Co. have reorganized and commenced the manufacture of hollow blocks.

The Hamilton Steel & Iron Co. will open their new spike mill at their smelting works in a few days.

The Toronto and Hamilton Sewer Pipe Co. will rebuild at Hamilton; their works destroyed by fire.

Picton is to have a $30,000 collegiate institute, a $10,000 Carnegie library and a $25,000 house of refuge.

The Electrical Construction Company, London, has given an option on its plant to an American syndicate.

It is understood that the International Electric Co., of London, will absorb the Electrical Construction Co.

The British Columbia Electric Railway Co. will extend their lighting system from Steveston to Ladnor.

The Canadian Rubber Co., Montreal, will increase its capital to two millions, and will extend their plant.

The Wade Manufacturing Co. has been organized in Dundas, Ont., to manufacture silver-plated novelties.

J. McDairmid & Co. have the contract for an 18 stall engine house at Broadview, Sask., to cost $60,000.

A canning factory will be erected at Tilbury, Ont. H. E. Edgecombe, of Strathroy, will be manager.

W. H. Clark, Edmonton, is at the head of a company who are building a planing and saw mill near that city.

The Jackson Wagon Works is moving from St. George to Galt, where a $12,-000 loan has been voted them.

Madison Williams, manufacturer of mill machinery, Port Perry, contemplate establishing a plant in Lindsay.

R. L. Frost has commenced operations in connection with installing the Brooke lighting system in Owen Sound.

The New Westminster Board of Trade will advertise their industrial advantages through the daily papers.

The British Columbia Copper Co. have started to expend $300,000 on their smelter, machinery and equipment.

The Vancouver Island Portland Cement Works will increase their plant to produce 300 barrels a day more.

The Hamilton Steel and Iron Co. will build another 400 ton blast furnace either in Hamilton or on Lake Erie.

The Dominion Copper Co. have purchased a 30 drill compressor, to be used in their mines at Phoenix Camp, B.C.

The basket-making plant of Geo. H. Williams, Thorold, Ont., is offered for sale by G. B. Burson, St. Catharines.

The Bowser Manufacturing Co. will build a factory at Riverdale, Toronto, for the manufacture of gasoline tanks.

W. W. Scott's furniture factory at St. Louis de Mile End, Montreal, was destroyed by fire. The loss is about $20,-000.

Winnipeg capitalists are applying for a charter to incorporate the Colonial Bank of Canada with a capital of $3,000,000.

John Crowe and others, of Guelph, will convert the Crowe Iron Works, recently damaged by fire, into dwellings.

The business men of Fort Frances, Ont., have organized a business association with a view to developing the town.

The Jenckes Machine Co., Sherbrooke, Que., have built a 250-horse-power hoist for the Granby smelter at Phoenix, B.C.

The village of Rigaud, near Montreal, advertises bonuses and special inducements to manufacturers to locate there.

The Belleville Rolling Mills have been purchased by J. W. Wardrope, of Ottawa, who will install more machinery.

The Canadian Westinghouse Co., Hamilton, will spend $200,000 increasing their plant and will employ 500 more men.

C. N. Choate, of Woodstock, has invented a new cement block machine and with others will manufacture it in that city.

Business men of Nelson, B.C., have formed a 20,000 club and are taking aggressive steps to increase their population.

The work on the extension of the Canadian General Electric Co's works in Peterborough will be commenced at once.

The Canadian Manufacturers' Association are urging Montreal City Council to advertise its manufacturing advantages.

James J. Hill has ordered 20,000 tons of steel rails from the Soo Company and 3,200 from the Dominion Steel Company.

The town of Fort William is negotiating with a car wheel foundry company with a view to its establishment there.

The Minister of Mines for Ontario announces that a free site will be given any one building a smelter in New Ontario.

The Hensall, Ont., foundry has been sold to Hunt & Boyd, London, who will manufacture radiators and plumbing supplies.

The Dominion Iron & Steel Co. have concluded a contract with the Pacific Construction Co. for 4,000 tons of steel rails.

P. Burns & Co., Vancouver, will erect an abattoir in that city this year, which will employ a large number of hands.

C. R. S. Dinnick has the contract for the new press building at the Industrial Exhibition, Toronto. The price was $9,999.

North Battleford has become incorporated as a town and the citizens are taking up the matter of waterworks and sewage.

The Canadian Westinghouse Co. have made a contract to equip the Windsor, Essex & Lake Shore Railway with

motors, transformers, etc. The amount is over $100,000.

The Meisell Manufacturing Co., of Port Huron, will establish a plant in Winnipeg for the manufacture of milling machinery.

The Mount McKay brick and tile works of Fort William have been purchased by Geo. Alsip, a Winnipeg contractor.

Negotiations are understood to be on foot for the consolidation of the Granby Rubber Co. with the Canadian Rubber Co.

M. A. McNamara, who owns 240 acres bordering on the canal at Peterborough, offers free sites there to reputable manufacturers.

H. J. E. Wilcox has found a large body of silica sand on his farm near Niagara Falls. This sand is used in foundries.

The Dodge Mfg. Co., of Toronto, are equipping with shafting, etc., the new canning factory of W. R. Wright in Picton, Ont.

The largest and most powerful dredge in Canada, being made by Polsons, Toronto, will commence work at Toronto this week.

Geo. Stevens, of Peterboro, has started a lye factory at that place. About ten hands will be employed at the commencement.

The Bennet Furnishing Co., of London, have temporarily closed down, pending a dissolution of partnership and reorganization.

The Nester estate at Ashland, Wis., will dismantle its saw mills and move the machinery to Thessalon, on the Georgian Bay.

The Bridge and Structural Iron Workers' Union have signed an agreement to work for 30 cents an hour with the usual overtime rates.

A manufacturing company is negotiating with Port Hope with a view to establishing a business at the radiator buildings there.

The partially completed factory of the Henderson Roller Bearing Co., Toronto, is offered for sale by the Trusts & Guarantee Company.

A new match factory is to be erected and equipped in Sarnia, Ont., and Mr. J. M. Diver is looking after the interests concerned.

James T. Thompson, of Helena, claims to have discovered platinum on the Pacific coast in British Columbia, in good quantities.

McLeod, Alta., has offered the Gate City Milling Co., of Keokuk, Ia., a free site and tax exemption to build a 200-barrel flour mill.

The Shearer, Brown & Mills Co., of Montreal, have purchased the Dixon timber limit at Buckingham, Que., and will build mills there.

The Prairie City Oil Co., St. Boniface, had their plant destroyed by fire. The loss is about $20,000. They will carry on business.

A. McKay, of Seattle, is at the head of a company, who, it is reported, will build a glass manufacturing plant at New Westminster.

The Crandall Cutlery Co., of Bradford, Pa., ask for a free site and tax exemption in London, Ont. The council has the matter in hand.

The Bowmanville Foundry Co. will build a three story addition, 60 by 32 feet. Their specialty is light castings for piano work, etc.

The MacGregor-Gourlay Co. will make large additions to their works at Galt which will necessitate employment for 150 additional hands.

Chappel Bros. & Co., Sydney, N.S., are installing a four-and-a-half-ton molding machine, made by J. Ballantine & Co., of Preston, Ont.

A. W. Cox, of Skagit county, Washington, has purchased a saw mill at Gibson's Landing, B.C. He will manufacture interior finishing.

The Brantford Screw Works have secured a site in that city upon which they will build a new plant, provided a railway switch is put in.

Iron pyrites is being mined in Hastings county and shipped to Buffalo, where it is manufactured into sulphuric acid of a high quality.

The Montreal Light, Heat & Power Co., of Montreal, will erect a power house at Soulanges, Que., which will cost a million dollars.

The marriage of Dr. J. J. Hardy, secretary-treasurer of Kingston Locomotive Works, to Miss Anna Fitzhugh Powell was celebrated recently.

The Dominion Copper Co. will put in a third blast furnace at Boundary Falls, B.C., which will bring the daily output up to 1,200 tons of ore.

The Amherst Foundry Co. have commenced the work of building an addition to their molding shop. The extension will be forty by sixty feet.

The Henderson Roller Bearing Co. will be reorganized under the name of the Dominion Henderson Bearings, and will carry on the business.

Russell and Dougherty, two American capitalists, have been in Brantford planning to establish a factory there to manufacture metallic packing.

The Yale-Columbia Lumber Co. have acquired the Kettle River Lumber Co.'s business and will operate four saw mills in British Columbia this year.

Mr. F. Wilson, of the firm of Williams & Wilson, machinery merchants, Montreal, sailed by the Virginian on a six weeks' business trip to England.

The Weed Chain Tire Grip Co., of New York, who manufacture a chain tire grip for automobiles, have established a branch factory at Bridgeburg, Ont.

There is some talk of developing a water power on the Saskatchewan River near North Battleford, which is capable of yielding 2,000 H.P the year round.

The molders of Hamilton have settled their troubles with the employers. Their scale of wages will remain the same. The employers wanted to make a cut, while the men wanted an increase.

The Copper Mining and Smelting Co. of Ontario now own the old Bruce Mines, which are said to be still rich in copper. A new smelter will be built.

The Canadian General Electric Co. ask the city of Peterborough for a fixed assessment of $150,000 on condition they expend $300,000 more on their plant.

The steamer Bergenus is at the Dominion Iron & Steel Co's piers, Sydney, unloading the first iron ore cargo of the season from Wabana, Newfoundland.

Chas. O. Spelman, of Hamburg, N.Y., contemplates starting a plant within the next few months and will be in the market for a large quantity of machinery.

The Lake of the Woods Milling Co. will build an oatmeal mill at Portage La Prairie, and also extend their elevator system to about 30 more places in the west.

Active work has now begun in preparing the site of the new Royal Bank building on St. James street, Montreal. It will be pushed to completion as rapidly as possible.

The Western Electric Company, of Berlin, have added two large stamping presses to their plant, and other equipment for the speedy turning out of trunk trimmings, etc.

Fort William will vote on a by-law to grant tax exemption to the Canada Iron & Foundry Co., of Montreal, who will build a branch there costing $125,000, and employing 300 men.

The additions to be made to the Cockshutt Plow Works at Brantford, will consist of a 70 foot extension to the storage building, and a like sized addition to the molding shop.

The Amherst Foundry Company will increase its capitalization to $450,000, and will make extensive additions to their plant at Amherst, N.S. A branch has been opened in Winnipeg.

A. E. Knapp, representing Seattle capitalists, has taken an option on copper lands on the Queen Charlotte Islands, B.C. Reports say that these properties are rich in copper ore.

The Hamilton Steel & Iron Co., Limited, have decided to erect a second blast furnace with a capacity of 400 tons per day. The new blast furnace will either be on Lake Erie or at Hamilton.

Wm. Lorimer, of the Lorimer Automatic Telephone System, Chicago, has announced that his company will build a large plant in Peterborough for the manufacture of telephone appliances.

The American Tobacco Co. have completed arrangements for the erection of a large new plant on St. Antoine street, Montreal. It will be built by the Dominion Engineering & Construction Co.

The village of Rigaud, Que., is offering special inducements to attract manufacturers to that place at the present time. These inducements include free site and water power and bonuses.

It is expected that the Atikokan iron mines will be ready to ship ore by the 1st of August, by which time the contract with the Canadian Northern comes into force, to ship 600 tons of ore daily.

The American Locomotive & Machine Works will expend $1,000,000 in extending their works at Longue Pointe. The principal enlargements will be the steel bridge and the locomotive departments.

The new mill being erected by the Eagle spinning mills in Hamilton is the first cotton mill in Canada to be built entirely of reinforced concrete. The Kahn system of reinforcement is being used.

The following officers have been elected for the Northern Iron & Steel Co., Limited, of Collingwood: President, Major J. A. Currie; vice-president, J. C. Lindop, St. Thomas; secretary, Duncan Donald.

The Schwab interests, of Pittsburg, have purchased $500,000 worth of iron ore from the Mineral Range Iron Mining Co. The ore will be taken by rail to Port Hope and ferried across the lake from there.

A New York firm has made a contract with Mr. Farnham, of the Hastings county iron mines, for a large supply of ore. A railway will be at once built to the mines from L'Amable station, five miles distant.

A sand-lime brick manufacturing establishment is to be built in Brantford. The property and building will cost $10,000, and $30,000 worth of machinery is to be installed. Mr. W. D. Schultz is managing director.

M. A. McNamara, Peterborough, is offering free sites to manufacturers who will locate there. These sites are to be taken from a farm of 240 acres bordering on the canal, and having G.T.R. and C.P.R. tracks nearby.

The Robb Engineering Company have received an order through the Canadian Westinghouse Co., of Vancouver, for two 20 horse-power engines to be used for lighting purposes on the C.P.R. steamer Prince Royal.

The Dominion Copper Co., of Phoenix, B.C., will install a 30-drill compressor and a hoist of 150 horse-power. With these and other new machines they purpose installing they will be able to treat 1,200 tons daily.

The Dominion Engineering & Construction Co., recently incorporated, have received the contract for constructing the new $150,000 plant for the American Tobacco Company, on St. Antoine street, Montreal.

The Keewatin Power Co., Limited, are advertising the sale of their developed water power at the outlet of the Lake of the Woods on the Winnipeg River. The horse power developed is 28,000 by a fall of nineteen feet.

The Nester Estate of Detroit and Baraga, are dismantling their large sawmill in Ashland, Wis., and are moving their machinery to the Georgian Bay district, Ontario, where they recently purchased a large tract of timber land.

McLean & Sophus, Montreal, are putting on the market a new sketch book, which is a combination of two old ideas, i.e., sectional paper for sketching and carbon copying. It is meeting with approval wherever shown.

Mr. F. Johnston, manager of the J. C. McLaren Belting Co., Montreal, is absent from the city on a several weeks' trip visiting the firm's different agencies between Montreal and Winnipeg. He will establish a branch in the latter place.

Work has been commenced on the Model City on Lake Michigan where the Indiana Steel Co. proposes to build the largest steel mills in the world at a cost of $10,500,000. The new city is to be built to accommodate the toilers at the mills.

Keating & Duncan have opened offices at the Home Life Building, Victoria street, Toronto, where they will carry on business as civil engineers, special attention being given to hydraulic, municipal, electrical and industrial undertakings.

The Upper Canada College, Toronto, has placed an order with the Robb Engineering Co., Limited, for a 150 horse power Robb-Mumford boiler, and one of 130 horse-power has been ordered by the Hudson's Bay Co. for their store at Winnipeg.

There is a probability of blast furnaces being established on the Ashbridge's Marsh land in Toronto shortly. The assessment commissioner is negotiating with the interested parties, and prospects are bright for an agreement being reached.

The Transcontinental Railway Commission are inviting tenders for 65,000 gross tons of eighty-pound steel rails (open hearth or Bessemer) and the necessary fastenings, and 1,545,000 railway ties. Tenders will be received up to noon of June 7.

As reported in Canadian Machinery some time ago, the Brantford Screw Co., Brantford, Ont., have decided to enlarge their plant considerably. Already much machinery has been ordered. The capital stock of the company has been increased to $300,000.

The Cockshutt Plow Co., Brantford, are going to extend their plant. The molding shop is to have a 70-foot addition, as is also the iron storage building The changes that are being made will allow room for the extension of the experimental department.

Allis-Chalmers-Bullock are sending to the trade the fifth series of monthly calendars showing coats of arms of the different provinces of Canada. The latest is that of Manitoba. No doubt they will send them to any reader of Canadian Machinery on request.

The Canadian Westinghouse Company Yonge street, Toronto, have recently added to the equipment of their shop owing to the increased demand for their output. At present their energies are being devoted to the production of motors of different sizes for motor vehicles, including large drays and conveyances.

J. A. Burnett, who has been for some years connected with the Montceal Light, Heat & Power Co., has been appointed superintendent and electrical engineer of the Southern Counties Railway, which will connect Montreal with Longueuil and Chambly Canton.

The Rapid Tool Co., of Peterborough, which has been recently incorporated, expect to be in running shape by July 1st. They have made an agreement with the inventor of the Caldwell lightning auger bit to manufacture this bit in Canada, and will turn out 1,000 of them per day.

The Dominion Sewer Pipe Co., Swansea, Toronto, Ont., are enlarging their plant considerably. Two more storeys are being added to the present building besides which a new coal and clay house has been built. These additions will give the company 60,000 square feet of drying floor space.

The Dominion Brewery Co. have placed an order for a side suction centrifugal pump with the Smart-Turner Machine Co. Another plant at present installing these pumps is the corporation of Meaford, who are being supplied with a complete auxiliary pumping plant, including engine and pump.

Since they have equipped their new foundry with a system of electric cranes and a Roots blower system, John Bertram & Sons, Dundas, find they have on hand a quantity of A1 apparatus that would be very desirable for a smaller plant, and which they are prepared to sell on reasonable terms.

In addition to the plant the Hamilton Steel & Iron Co. have installed for the manufacture of railway spikes, they will also shortly put up a plant for the manufacture of pipes and tubing. Their new blast furnace will have a capacity of 400 tons, but its particular location has not yet been decided upon.

The Dickson Lumber Co., of Peterboro, have conveyed their interests, consisting of mills and timber limits, to a syndicate composed of men from Toronto, Orillia and Boston, for the sum of $600,000. W. D. Loomis, of Toronto, is president of the new company. The Dickson Co. retain their Peterboro and Lakefield mills.

W. H. C. Mussen & Co., dealers in railway and contractors' supplies, Montreal, have purchased the large warehouse situated at Nos. 21 and 23 Colborne street, Montreal. This will give them excellent facilities for handling their goods, as the new warehouse faces the canal, and has railway sidings within 100 feet of the goods entrance.

The output of the Granby Consolidated for the month of April shows approximately 2,000,000 pounds. Late in the Summer additions and improvements will probably have been completed, enabling an increase in the yearly production of copper to 33,000,000 pounds. Within two years or so a further increase to at least 50,000,000 pounds per annum is expected.

The Smart-Turner Machine Co., Hamilton, are at present busy installing

their duplex pumps in the plants of Canadian Canners, Limited, Wellington; E. Leonard & Sons, London; Northwestern Transportation Co., Athabasca Landing; Dixville Butter & Cheese Co., the Berlin Button Works, the Northern Navigation Co., Collingwood; and Loveland & Stone, Cutler, Ont.

Owing to a typographical error in the article "A Talk on Foundry Chemistry." by H. L. Bowers, in the May issue of Canadian Machinery, Si 0_2 – oxide of silicon—read single 02 ; and for Fe S^2 —sulphide of iron—was printed Fess. In the same article there is a sentence which should have read: "Silicon is not in itself a desirable ingredient of cast iron," instead of "Silicon is not a desirable ingredient in cast iron." Not having seen a proof of the article, Mr. Bower is in no way responsible for the non-correction of these errors.

Numerous orders for Beardshaw's high-speed steel are being received from the Canadian trade owing largely to its own merit and the energy of its agent for Canada, Alex. Gibb, 13 St. John street, Montreal. When tested in competition with other high-grade steels, it has met with favorable recognition. The manufacturers of this steel also make high-speed twist drills which have the same durable and stubborn wearing qualities that have made the steel attractive for manufacturing purposes. The manufacturers of it have been established under the name of the Baltic Steel Works, of Sheffield, Eng., for nearly a century.

New Foundry and Machine Shop.

The Western Machine Co., Limited, 493 Dundas street, Toronto, manufacturers of "Monarch" gas and gasoline engines, have just moved to Stouffville, where they will manufacture their gas engines and conduct a general foundry and repair business on the premises formerly occupied by A. Fleury & Son. This firm is expanding considerably and in the new premises will be prepared to supply castings of all lines to manufacturers, any of whom will receive full information by communicating with this firm at their new address.

Lighting Contract.

The Packard Electric Co., of St. Catharines, who are Canadian representatives for the Jandus Electric Co., Cleveland, Ohio, manufacturers of enclosed arc lamps, have been successful in securing the series arc lamp contract from the Saint John Railway Co, St. John, N.B., consisting of 250 figure 80, series A.C. 7.5 ampere lamps, 5-50 light C.C. regulators, 5 standard 50 light switchboard panels with open circuit protectors, and 5-33 K.V.A. transformers. George C. Rough, salesmanager of the company, was in St. John recently and closed the contract. The Packard Company were also successful, through their western manager, G. A. Powell, in securing a similar contract for a 200 light equipment from the city of Winnipeg.

Machinery Wanted.

The by-law for $27,000 to enlarge the electric light plant was carried in Barrie, Ont., on May 16, 1906, by a large majority. The new equipment will consist of water tube boilers, a four hundred and fifty horse-power Corliss valve engine, direct connected to a two-phase, 2,200 volt, revolving field generator, necessary switchboard apparatus, piping, condensers, heaters, pumps, economizers, etc., and a series alternating street lighting system.

Manufacturers' Day.

A new event in the history of the manufacturing interests of Canada and the United States was inaugurated on April 28th when, in response to the joint invitation of the Boards of Trade of Niagara Falls, Ont., and Niagara Falls, N.Y., representative manufacturers from both countries were entertained at the Falls. The committee included E. H. Taylor, chairman, and O. D. Glasgow, presirent; D. B. White, W. A. Arison, and F. E. Dalton, from the Canadian Board of Trade, and Geo. W. Knox, president, J. E. Montague, Geo. F. Nye and John C. Level, from the United States Board of Trade, besides which was a strong reception committee who made the guests feel thoroughly at home when visiting the different power and manufacturing concerns at the Falls. The Canadian representatives left Toronto at 11.30 the evening before on a special train, which was shunted on a siding at Niagara Falls, Ont. The committee of the boards of trade met the visitors, who were taken by special cars to the "Home of Shredded Wheat," where the guests from all quarters had gathered and where breakfast was served in a dainty manner. The itinerary for the day included the inspection of the Hydraulic Power and Manufacturing Co.'s plant on the United States side, the inspection of Niagara Falls Power Co., luncheon at the Ramapo Iron Works, a private car trip around the city, followed by a trip on the Niagara belt line down the Gorge on the American side and up the Canadian side. The different power companies' plants on the Canadian side were then inspected, starting with the fore bay of the Ontario Power Co., and in turn the Electrical Development Co.'s plant, the Canadian Niagara plant, and the power house and transformer building of the Ontario Power Co. A reception was tendered all the guests at the Hospice at 7.00 p.m. The crowning event of a thoroughly eventful day was the banquet at 7.30, where over 300 guests sat down, representing manufacturing interests of over $100,000,000. Addresses were given on practical and technical subjects, including "Technical Education," by Harold W. Buck, and "Possible Uses of Electricity in a Modern Plant," by Calvin W. Rice and Paul Lincoln. Mr. Edward Gurney, of Toronto, was called upon to speak on "Manufacturing in Canada," his address being particularly well received. The visitors from far and near were greatly impressed with the result of their day's visit and the hospitable treatment accorded them at the hands of the Niagara Falls committees. A movement of this kind to bring the manufacturing interests of the two countries into closer unison should be encouraged. It was announced that this was an annual affair, and that every year hereafter it is proposed that the manufacturers meet under similar auspices.

PERSONAL MENTION.

Mr. C. B. Brown has been appointed division engineer of the Atlantic division of the C.P.R., with office at St. John, N.B.

Mr. M. Gregory has recently opened an office at 13 St. John street, Montreal, as sole representative of the Vulcan Smoke Consumer and Fuel Economiser Company.

The Whitman & Barnes Mfg. Co., suffered the loss of one of the members of the company recently in the death of Mr. Geo. E. Dana, chairman of the board of directors. The late Mr. Dana was prominent in business circles where he held many positions of trust and power.

Mr. Sydney Jessop Robinson, master cutler, of Hallamshire, managing director of William Jessop & Sons, is at present in this country on a business trip, in connection with American and Canadian agencies for his firm. Part of his trip was on behalf of the Cutlers Co., a history of which he personally presented to President Roosevelt at the White House as well as a copy to the Congressional library and one to the library at Ottawa. The Cutlers Co. is an unique organization, three hundred years old, somewhat similar to the City of London Guild, this being the first time the history of the organization has been written up. Mr. Robinson is a 282nd master cutler. He arrived by Campania on May 2 and sails June 5. Mr. Robinson reports excellent business in this country and prospects more promising than ever.

* * *

Now Estimating Engineer.

Mr. A. L. Mudge, who has been appointed estimating engineer of Allis-Chalmers-Bullock, Limited, Montreal, is one more Canadian, who, after experience in the great industrial establishments of the United States, has returned to take a responsible position at home. After graduating from McGill University in mechanical engineering in 1894, and in electrical engineering in 1895, he spent one and one-half years with the Canadian General Electric Co., Peterboro, and afterwards some time with the Royal Electric Co., Montreal. From 1899 to 1901 he was electrical engineer for the Grand Trunk Railway System

from Portland to Detroit. From Montreal he went to Pittsfield, Mass., to take charge of construction work for the Stanley Electric Manufacturing Co. During the past two years he has been with the Allis-Chalmers Co. partly in the Bullock Electric Works, Cincinnati, and latterly in the head office, Milwaukee.

OUR CONDENSED ADS. BRING QUICK RETURNS

RATES

One insertion—25c. for 20 words; 1c. a word for each additional word.

Yearly rate - $2.50 for twenty words or less, 10c. a word for each additional word.

The above does not apply to notices under the head of "Machinery Wanted." These notices are inserted free for subscribers.

MACHINERY FOR SALE.

FOR $650—Half value—one 10 h.p. engine; one 40 h. p. boiler, 50-ft. stack; 1¾ acres land; good house, mill building and stable; suitable for small factory; or will sell machinery separate; location, Hepworth, Bruce County. Write R. Murdoch, Sault Ste. Marie, Ont,

GASOLINE, marine and stationary engines; before buying get prices of our "Honest Injun," something new from United States. Manufactured by The Miller Reversible Gasoline Engine Co., 39 Sherbourne street, Toronto. [6]

GASOLINE ENGINES—The Adams catalogue will give you a good idea where to locate the best engine for your new boat. The Adams Launch & Engine Manufacturing Co., Penetang, Ont. [6]

MACHINERY WANTED.

WANTED—Fifty horse power second-hand motor; must be in good condition and cheap. Pure Color Co., Hamilton. [6]

MACHINE TOOLS WANTED.

ADVERTISER has spot cash for 16 to 18-in. lathe, miller, 20-in. geared drill speed drill, speed lathe, cutter grinder. Address, C. Harding, 5 Leonard avenue, Toronto. [6]

SITUATIONS VACANT.

WANTED—For a well-established concern abroad, a live advertising man, well educated, accustomed to printers work and to high-class advertising through all channels; knowledge of European, and especially of English, methods and ideas an advantage. State age, experience (fully), remuneration sought, and when disengaged to Advertiser, CANADIAN MACHINERY, Montreal.

REQUIRED for a "small arms" factory abroad an educated engineer with experience of very high-class interchangeable work produced by the latest automatic and repetition methods; must be active, energetic, thoroughly at home in jig and fixing work and up-to-date generally. Write fully as regards experience and salary expected, also stating age, etc., to Box W, CANADIAN MACHINERY, Montreal.

SALESMAN WANTED—Capable salesman, energetic, familiar with planing mill machinery and general mill supplies; applications confidential. Address, P.O. Box 846, Vancouver, B.C. [8]

PATTERN-MAKERS—One or two first-class, on transmission machinery. Apply Mr. Hertfelder, Dodge Manufacturing Co., Toronto. [6]

WANTED—A machinist, all-round man; accustomed to running lathe or bench work; also floor man; state wages and experience. Reply, The Georgian Bay Engineering Works, Midland, Ont. [6]

WANTED—First-class machinery blacksmith; steady employment; state experience, age and wages expected. Reply to Algoma Iron Works, Sault Ste. Marie, Ont. [6]

WANTED—First-class lathe, vise and planer hands. Smart-Turner Machine Co., Limited, Hamilton. [6]

FOR SALE.

ONE hand fire hose reel, practically new; capacity, 2½ inches hose; reason for selling, have two hose wagons, require only one Apply to the Corporation of the Town of Magog, [7]

DYNAMO—Manufactured by the Canadian General Electric Co., Limited; Thompson-Houston system; patented 1893; Class "A1" 120, No. 1527; speed, 1,070 revls.; volts full load, 2,308; no load, 2,080. Apply to the Corporation of the Town of Magog. [7]

FREE SITE.

A PROGRESSIVE manufacturing city in Ontario offers free site to prospective manufacturer; splendid railway facilities; the cheapest water power on the continent. Address, Box 319S, CANADIAN MACHINERY, Toronto. [6]

EDUCATIONAL

MECHANICAL drafting pays; complete course, $5. Browning Press, Collinwood, O.

BUSINESS CHANCES

MACHINE SHOP—Established 12 years; lathes, drills, grinders, etc.; patterns for 3, 6, 15 and 25 h p. gasoline engines; automobile engine patterns for 6, 12 and 16 h p.; also several other patterns and engines in stock at present; repair trade paying big profits; in Canadian town of 45,000 inhabitants; must be sold at once on account of ill-health of proprietor; price about $3,000. Box 301, CANADIAN MACHINERY, Toronto. [6]

LOCATION WANTED—We are seeking a location for a steel stamping industry that will give employment to about 75 hands; owing to large demand for articles of this kind in Canada, we are desirous of locating there; what inducements can a progressive city offer? Address reply to The Crescent Machinery Co., 1,535 Williamson building, Cleveland, Ohio. [6]

INDUCEMENTS SOUGHT—A firm employing over a hundred hands, would like to get full particulars of inducements offered by Canadian towns and cities to branch of reliable and well established concern. Reply to Manufacturer, c/o CANADIAN MACHINERY, Toronto. [6]

MACHINE SHOP FOR SALE

ON KING STREET, TORONTO

Most desirable premises on King St., near Sherbourne, Toronto; close to railway siding; convenient goods entrance; three floors and basement, containing 12,103 square feet floor space.

The following tools are in good condition:

1—Power Hack Saw.
1—8 H.P. Gasoline Engine (Walwrath).
1—Bench Emery Grinder.
1—Universal " (Brown & Sharpe).
1—30 x 30" Planer (Petrie).
1—Universal Milling Machine (Bertram).
1—28" Spindle Emery Stand.
1—16" Shaper (McGregor & Gourlay).
1—14" Vertical Drill Belt Drive (A. R. Williams).
1—10" Barnes Friction Speed Drill.
1—24" Vertical Drill (A. R. Williams).
1— Champion Forge.
1— Gasoline "
1— Hand Press.
1— Screw "
1— Circular Saw, Table and Iron Frame (Petrie).
1— Band Saw.
1—40" Hollow Spindle Gap Lathe (McGregor & Gourlay).
1—14" " " Engine Lathe (Porter).
1—18 x 6" Hollow Spindle Lathe No. 5 (Bertram).
1—12 x 5" Barnes Engine Lathe No. 4.
1—16 x 10" Engine Lathe (McGregor & Gourlay).
1—20 x 14" Wood-turning Lathe.

We desire to sell these premises at an early date, and are willing to make reasonable sacrifice to prompt purchaser.

Write for full particulars.

ENGINEERING:

AN ILLUSTRATED WEEKLY JOURNAL

Edited by WILLIAM H. MAW and JAMES DREDGE

PRICE SIXPENCE.

"ENGINEERING," besides a great variety of Illustrated Articles relating to Civil, Mechanical, Electrical and Military Engineering and Notes of General Professional Interest, devotes a considerable space in each issue to the illustration and description of all matters connected with the PRACTICAL APPLICATION OF PHYSICAL SCIENCE, and with its Wide and Influential Circulation in all parts of the world, this Journal is an

UNRIVALLED MEDIUM FOR ADVERTISEMENTS

SUBSCRIPTIONS (Home, Foreign and Colonial)

"ENGINEERING" can be supplied, direct from the Publisher, post free for Twelve Months, at the following rates, **payable in advance**:—

For the United Kingdom - - - - - - £1 9 2

For all places abroad:—

Thin Paper Copies - - - - - - £1 16 0

Thick " - - - - - - £2 0 6

Subscribers residing abroad are strongly recommended to order copies on thick paper, as the illustrations are necessarily very much less effective in the thin paper edition, and to remit, when possible, by Post Office Order made payable at Bedford Street, Strand, London, W.C. When Foreign Subscriptions are so forwarded, advice should be sent to the Publisher.

Foreign and Colonial Subscribers receiving Incomplete Copies through Newsagents are requested to communicate the fact to the Publisher, together with the Agent's Name and Address.

Cheques should be crossed "Union of London and Smiths Bank, Limited, Charing Cross Branch."

All accounts are payable to "ENGINEERING, LIMITED."

ADVERTISEMENTS.

Prepaid Advertisements on Wrapper, **classified** under headings: Tenders—Appointments Open—Situations Wanted—Partnerships—Wanted, &c.—For Sale—Auction Sales—Publications—Miscellaneous—Patent Agents—&c.

By the Line—Four Lines or under, 3s., each additional Line, 8d. The Line averages Seven Words.

By the Inch—8s. per Inch Single Column, One Insertion.

5% allowed on 6, 10% on 13, 15% on 26, and 20% on 52 Insertions.

Advertisements intended for insertion in the current week's issue must be delivered not later than 5 p.m. on Thursday.

For Displayed Advertisements, Special Terms are given.

Offices of "ENGINEERING," 35 & 36, Bedford Street, STRAND, LONDON, W.C.

Engines Electrical Machines

Some books that describe and illustrate every existing form of engine and generator, and tell about electrical installations, dynamos, motors of all kinds in modern use.

VALUABLE BOOKS FOR REFERENCE OR STUDY FOR EVERY MECHANIC WHO WISHES TO MASTER HIS TRADE.

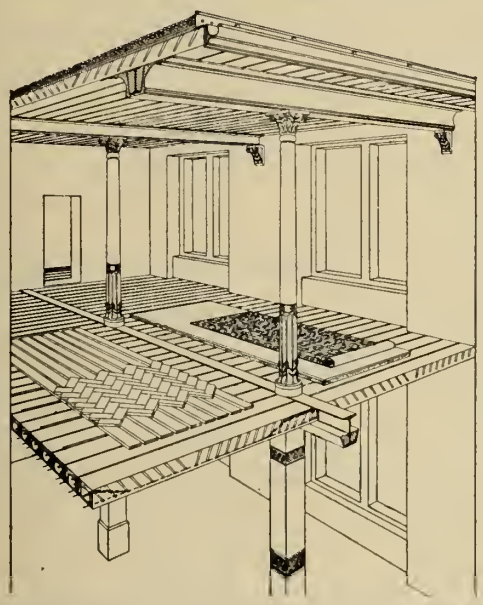
SIEGWARTBEAM

The best flooring and roofing system in reinforced concrete, cheap and easy to lay. Reform in building methods.

Saving of time. No skilled labour required. The hollow reinforced concrete beams are made to order in the factory and used hardened and dry in the building without any protection or frame work.

PATENTS IN ALL CIVILIZED COUNTRIES.

Absolutely Fireproof. Deafens Sound. Quickest and Easiest to Construct.



Largest Guaranteed Safeload, Isolation of Temperature, Hygienic.

30 Siegwartbeam factories in Switzerland and abroad already working. ***Patent Rights For Sale.*** For terms and further information apply to the

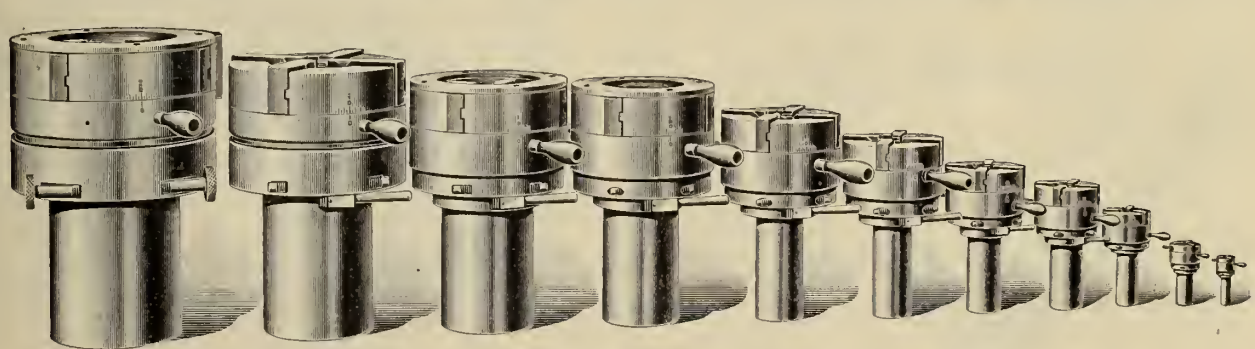
TOOLS FOR EVERY REQUIREMENT



Our style "**D**" **SELF-OPENING** and **ADJUSTABLE SCREW CUTTING DIE HEAD** cuts right or left hand threads of any length—standard or special pitch.

Quick and accurate varations may be made in the diameter of threads for a tight or loose fitting screw, as desired; and as the dies are adjusted simultaneously, the greatest accuracy is assured.

The **DIES** are opened automatically by stopping the travel of the turret slide.

This tool saves a lot of time and money when used on screw machines, turret lathes or the carriage of engine lathes.

If you want to reduce cost and increase output, send samples or blue print of your work, and we will quote price on the proper size **DIE HEAD** or cover your requirements.

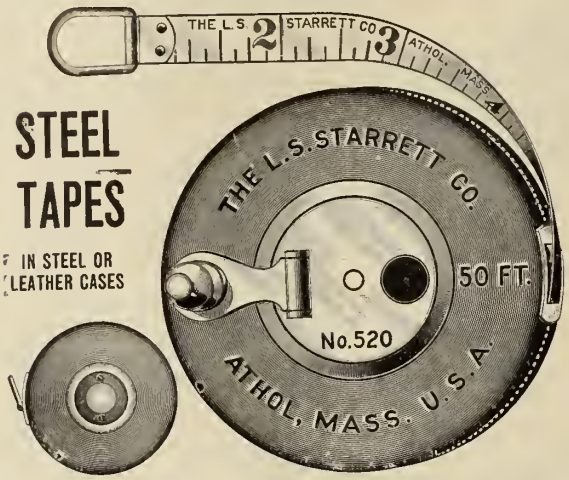
STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH



STEEL TAPES

IN STEEL OR LEATHER CASES

In our tapes the figures denoting feet are smaller than those denoting inches. Two reasons for this :

This dissimilarity of figures materially lessens (in fact ought to entirely prohibit) the liability to erroneous readings that frequently occur through the uniformity of all figures in steel tapes of other makers.

The smaller figures, denoting feet, allow the graduation line under each to be plainly visible, instead of being obliterated by the usual larger figure.

Graduated in feet, inches and eighths of an inch, or in feet, tenths and hundredths of a foot.

LATHE PLANER AND SHAPER TOOLS

CHAMPION TOOL HOLDERS

The Holders are drop forged of a good grade of steel, and are thoroughly case hardened. The Cutters are nearly twice the length of other makes. Set Screws are made of tool steel hardened on the point, and are extra large, giving a good solid bearing and will positively not allow the cutter to slip—the best lathe tool made.

EXPANDING MANDRELS

SETS FROM ½ TO 6½ INCH.

consisting of only two parts, a taper arbor and a flexible round sleeve. Each part being of best grade of steel, thoroughly hardened, they are practically unwearable. They cost about one-third the price of solid arbors of equal range.

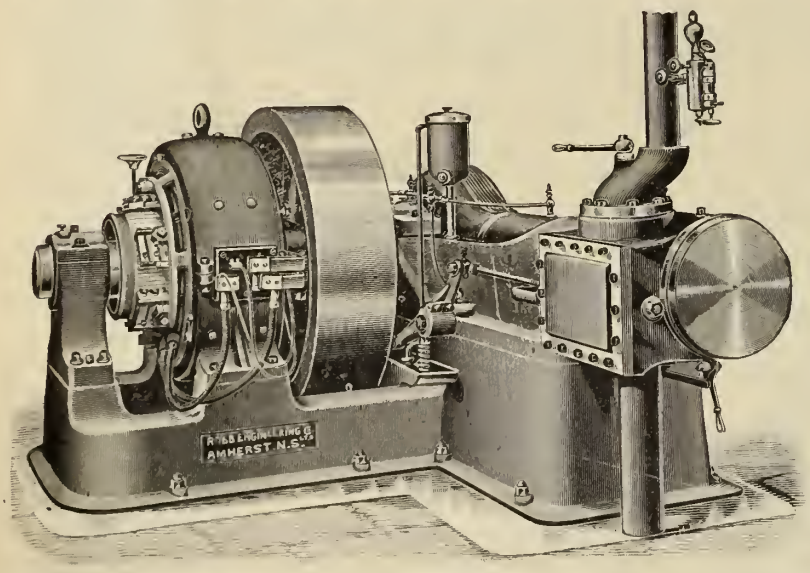
Not One Cent for Repairs!



An Experienced Engineer writes us as follows:

"After eighteen months of hard service, the 'Robb' engines are in excellent shape, running very smooth and without a bit of vibration. Up to this time they have not cost one cent for repairs, the only expense being for steam, oil and packing, and this lower than the average. Perfect alignment, parts well machined and good design, make the 'Robb' the most economical and labor-saving engine that has ever come to my notice."

New Type, 22 in. All Geared Lathe.

HAMILTON, - ONTARIO

No. 1-14 Cutter and Reamer Grinder.

WE HAVE A FEW OF THESE MACHINES READY FOR IMMEDIATE DELIVERY

This machine is distinctly a cutter grinder, and was designed to fill the want for a machine to sharpen milling cutters of all kinds and shapes, without special fixtures or special-shape emery wheels, being heavy enough to eliminate all vibration and still be easily operated. It weighs about 1370 lbs. The table, which has a long bearing on the saddle, has a longitudinal feed of 20 in., cross adjustment of 7 in., with a vertical adjustment of 6 in. Cutters 1 in. to 14 in. can be taken between centres. The table can be used at different angles with the spindle in horizontal plane, by swiveling the knee around the column. The machine is compact, durable, adaptable and a necessity for the busy shop.

Modern Canadian Manufacturing Plants.

ARTICLE XVII.—New Plant of London Machine Tool Co., Hamilton.

INDIVIDUAL Canadian industries are forging ahead, and as a result, Canada is thriving industrially. The machine tool business is one which has made considerable progress of late years and its future appears exceptionally roseate. The London Machine Tool Co. have had their share of prosperity in the past, and are looking forward with enthusiasm to future development. Undoubtedly the machine tool business has a very bright outlook because in the industrial expansion, of which there is such great promise, machine tool equipment is one of the first essentials. At all events, from the size of the present new plant at Hamilton and from the marked facilities for extension and from additions at present being planned, it would appear that the London Machine Tool Co. have ample faith in the future. The new plant is nearly four times the size of their old plant in London, which was burned recently, and from orders already obtained, this year promises to be the largest in the history of the company.

Officers of the Company.

The president of the company is Mr. William Yeates, who has been in the machine tool business for over 25 years, and is probably one of the best known machine men in the Dominion. The general manager is Mr. E. G. Yeates, who is a technical as well as practical man, and the secretary-treasurer is Mr. Roland Yeates. The drafting department is under the charge of Mr. P. M. Yeates. The directors of the company are the above named gentlemen, together with Mr. Geo. F. Webb and Mr. Wm. Southam.

Lay-out of the Works.

The company have eight acres of land situated on the main line of the Grand Trunk Railway and have sidings running into the property. Thus excellent shipping facilities are afforded, and there is plenty of room for extensions. At present the plant consists or a main building 200 feet long and 50 feet wide. From the east side of this main building extend several saw-tooth bays, 84 feet long, with north light. Plans are now being prepared for a 100-foot extension to the main building, with corresponding saw-tooth bays. The buildings are steel construction, foundations being concrete construction and the walls brick, except that the south wall of the main building is a temporary frame construction to allow extensions in that direction. The structural steel was supplied by the Locomotive & Machine Co., Montreal, from designs of Mr. John Lyle Harrington, chief engineer of Locomotive & Machine Co. The roof is of 2-inch tongued-and- grooved hemlock, resting on steel purlins, and is covered with Paroid roof covering made by the F. W. Bird Co., Hamilton. The floor is very substantial in construction. It consists of a 6-inch layer of cinders and slag, then a 4-inch layer of tar concrete; imbedded in this concrete are 4 x 4 inch sleepers spaced three feet on centres, upon which is placed a flooring of 2 x 6 inch tongued-and-grooved hemlock; and upon this is placed a final flooring of 7-8 inch birch, tongued-and-grooved. This constitutes a very smooth and solid floor.

Shipping Department: London Machine Tool Co., Hamilton, Canada.

Shipping Facilities.

The northern half of the main building is reserved for a shipping room. Shipping facilities are of the best, a siding from the G. T. R. running right into the shipping section of the main building. The main building is served by a 25-ton Niles electric crane and the saw-tooth bays are served by smaller pneumatic cranes, from which loads can be transferred to the large one. Thus there is excellent shop communication.

The Machine Shop.

The southern half of the main building serves as a machine shop for the very large work, such as the planing of lathe beds, etc., and also as main erecting floor. Here are situated all the very large tools. The saw-tooth bays constitute the main part of the machine shop. The first bay to the south is devoted to planers and boring mills, while in the next two are placed the lathes, grinders, etc. Two bays are reserved for the erection of the smaller parts, and each is served with a small crane, from which the erected parts can be transferred to the large traveling crane and conveyed to the main erecting floor. Among the machines in operation in the main machine shop may be noticed standard planers of the firm's own make, boring mills, of the Bullard Machine Tool Co. and of the firm's own make, a

line of lathes, made by the firm, ranging from 15 to 72-inch swing, some of them being motor driven. Jones & Lamson

Erecting Floor : London Machine Tool Co., Hamilton, Canada.

turret lathes, Brown & Sharpe & Norton grinders, and Gould & Eberhardt gear cutters, milling machines, etc. Among the larger tools are a 40-foot planer, motor-driven by a 25 h.p. Westinghouse induction motor; two radial drills, one 6-foot arm and the other 4-foot arm, and a 72-inch lathe, all of the firm's own make.

The system of tool drive is a combination of the individual and group drives. The machines in each bay are driven in groups by 10 and 15 h.p. induction motors. Some of the tools that are individually driven are equipped with D. C. variable speed motors and others with constant speed induction motors, the change of speed being obtained in the gear box. The electric traveling crane is equipped with two 30 h.p. and one 10 h.p. D.C. series motors, running on 220 volts.

The Forge Shop.

In one of the saw-tooth bays is situated the forge shop. The air in the shop is kept clear and free from smoke by the down draft forges, supplied by the Canadian Buffalo Forge Co., of Montreal. The fans for these forges are placed high up and out of the way.

Pattern Shop.

A separate one storey brick building, 60 x 36 feet, forms the pattern shop. It is not different from other pattern shops, containing the necessary machinery for pattern making, including a buzz planer made by Clark & Demill, band saw, rip saw, turning lathe, etc. The pattern storage building is a single storey cement construction building, 150 x 40 feet, with wire glass, metallic-framed windows and metallic doors.

Power and its Distribution.

Electric power is received at the transformer station at 2,200 volts, A. C., 2-phase 66 2-3 cycles, and is stepped down to 220 and 110 volts for distribution around the works, the 110 volt circuit being used for the lighting and the 220 volt circuit for induction motors. The transformer house is a brick building, 13 x 17 feet, and contains two 75 K.W. transformers. The direct current required for the D. C. variable speed motors and cranes is generated by a motor-generator set consisting of a 50 K.W. generator coupled to a 75 h.p. induction motor. The switch board is situated behind the motor generator set, and is equipped with all the necessary apparatus for receiving the power from the transformers and distributing it about the shops. The switch board and motor generator set were supplied by the Canadian Westinghouse Co., and the Can. Westinghouse and Canadian General Electric Co. supplied the rest of the motors.

Air, at 80 pounds pressure, is supplied to a receiver by an 8 x 8 Allis-Chalmers-Bulloek air compressor, driven from a line of shafting, and from thence goes to the air hammers, chippers, drills, etc., made by the Canadian Rand Drill Co.

Heating and Ventilating System.

The heating and ventilating system has been found very satisfactory. It is arranged upon the plenum system, and was installed by Sheldons, Limited. The steam is supplied by a 60 h.p. boiler, built by E. Leonard & Sons, at 25 pounds pressure, to a set of steam coils having 7,500 square feet of heating surface. Fresh air is drawn through these coils, and is conveyed to different parts of the buildings through galvanized piping. The fan is 160 inches in diameter and is run by a 15 h.p. induction motor. The office is heated by steam radiators.

Special attention has been paid to the lighting of the buildings, with exceptionally good results. Ribbed glass forms the greater part of the west side of the main building, there being three

Machine Shop : London Machine Tool Co., Hamilton, Canada.

rows of windows with metallic window frames. The roof is supplied with wire glass, metallic framed sky-lights. The northern side of the saw-tooth construction is of ribbed glass. Arc lights for general lighting and incandescent lights for detail lighting, operating upon an A. C. 110 volt circuit, constitute the artificial lighting.

The Molding Shop.

The molding shop has not as yet been built, but plans have now been completed and construction work will be commenced upon it very shortly. The building will be 175 feet long and 100 feet wide, having one central bay of 50-foot span and two side bays each of 25-foot span. The large bay will be controlled by two electric traveling cranes each of 25-ton capacity; and one of the side bays will be equipped with a 5-ton traveling crane.

The Offices.

The most northerly saw-tooth bay constitutes the offices. There is the lobby, the general offices, two private offices and the drafting, photo and blue-printing room. The offices, without being very elaborate in design, present a very handsome appearance. They are finished in Georgia pine and are panelled in dark green and brown.

At present the company are very busy. When the representative of Canadian Machinery went through the plant there were on the floor in the course of construction, a number of large presses, a large punch and shear weighing 40 tons, four horizontal boring machines, hammers, lathes and planers, vertical boring mill, etc.

The extent of the market exploited by the London Machine Tool Co. is shown by the fact that at the time of writing a car of machinery was being loaded for British Columbia, and the day before a carload of lathes had been shipped to England.

A Norton Grinder : London Machine Tool Co., Hamilton, Canada.

CONVENTION CANADIAN ELECTRICAL ASSOCIATION.

AT Niagara Falls, N.Y., on June 19, 20 and 21, the sixteenth annual convention of the Canadian Electrical Association was held. Although there was not the representation that might have been wished, it was a very successful and enjoyable convention. The convention delegates received a warm welcome from the mayors of the two Niagaras at the afternoon session of the first day and the rest of the day was taken up in discussion of three papers and the question box. These papers were: "Engineering Features of Ontario Power Co's Plant," by V. G. Converse: "Engineering Features of Electrical Development Co's Plant" by F. O. Blackwell, and "Engineering Features of Canadian Niagara Power Co's Plant, as Compared with the Original plan on the American side," by H. M. Buck. The paper "Legal Points of Interest to Electrical Engineers," presented by Robert McKay at the morning session of June 20, aroused considerable discussion. The afternoon of the same day was taken up in a visit to the three power plants on the Canadian side, which were discussed in session the day before. A smoking concert in the evening was an enjoyable ending to the day. The paper, "Steam Plant Accessories," by John T. Farmer, and the election of officers, occupied the final session.

President, R. G. Black, Toronto; first vice-president, R. S. Kelch, Montreal; second vice-president, W. R. Ryerson, Niagara Falls; sec.-treas., T. S. Young, Confederation Life Building, Toronto. Executive committee: J. A. Kammerer, Cataract Power Co., Hamilton; J. J. Wright, Toronto Electric Light Co., Toronto; W. Williams, Gas & Electric Light Co., Sarnia, Ont.; Lewis Burran, Quebec Railway, Light & Power Co., Quebec; H. O. Fisk, Peterboro Electric Light Co., Peterboro; J. W. Purcell, Hiram Walker & Sons, Walkerville; B. F. Reesor, Georgian Bay Light & Power Co., Lindsay, Ont.; A. A. Dion, Ottawa Electric Co., Ottawa; L. W. Pratt, Brantford Electric & Operating Co., Brantford; Chas. B. Hunt, London Electric Co., London, Ont.

Manufacturers and supply houses were well represented, among them being the following firms: Robb Engineering Co., New York Insulated Wire Co., Canadian Westinghouse Co., Pittsburg Transformer Co., Allis-Chalmers-Bullock, Canadian General Electric Co., the Wire & Cable Co., the Sunbeam Incandescent Lamp Co., R. E. T. Pringle Co., Mechanics' Supply Co., Standard Underground Cable Co., Packard Electric Co., Oneida Community, Limited, J. A. Dawson & Co., the Philadelphia Electrical & Manufacturing Co., Hamilton Steel & Iron Co., Conduits Co., Limited, Duncan Electric Mfg. Co., E. F. Phillips Electric Works, Rogers Electric Co., Murphy Iron Works, and Hamilton Anchor Co.

The Canadian Westinghouse Company had quite an extensive exhibit of Nernst lamps and other Westinghouse products. The Pittsburg Transformer Co. made an exhibit of transformers, and the Oneida Community exhibited their galvanized chain for arc lamp suspension. The Allis-Chalmers-Bullock printed and circulated, as usual, at four intervals, the "Register" of names of those in attendance, which was a very serviceable feature of the convention. They also exhibited a number of bromide enlargements of some of the machinery installations already made by them, the most noticeable of which was the power-house of the Northern Aluminum Co., where are installed the largest inter-pole generators ever built. The Canadian General Electric Co. distributed a very neat leather pocket note book and card case. A very handsome paper knife was the souvenir given out by J. A. Dawson & Co., Montreal. The Sunbeam Electric Co's souvenir was a very handsome leather pocket book, which was much sought after.

CANADIAN MACHINERY
and Manufacturing News

A monthly newspaper devoted to machinery and manufacturing interests, mechanical and electrical trades, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

JUNE'S METAL FEATURES.

CONSUMERS of pig iron have recently confronted a rather unusual difficulty, and one which will tend to somewhat increase the first cost on many of their products. A large proportion of the iron used in this country is of the softer variety, styled number 3. But nearly all the furnaces have been unable to meet orders for this grade during the past month, with the result that even those who had booked their specifications found themselves unable to procure number 3 in quantities sufficient for their wants. The only way out of the difficulty, in many cases, was to purchase harder iron at a cost of about one dollar per ton higher. This condition has been slightly relieved, but number 3 iron has felt its effect and higher prices are now being quoted on that grade by the majority of furnaces.

Among users of machinery the rapid advances undergone by antimony since the first of the year have created much interest, as this metal is an important factor in babbitts, the consumption of which is continually increasing. The normal price of antimony in Canada is about 7 cents per pound, but the present scarcity is such that the hitherto unheard-of figure of 30 cents has been the rule throughout the month of June. It is explained that all the known deposits of antimonial ore are nearly played out, and no improvement in the supply is to be expected until new ones are discovered.

All ingot metals are strong in tone, with the possible exception of tin, which, after reaching the record price of 50 cents per pound, has fallen away to 45. The demand continues very brisk, but it is notorious that the price of tin is always in the hands of speculators, and no prediction is safe. Ingot copper seems destined for higher prices and large buyers state that they are finding it increasingly difficult to buy at the prices quoted in the daily metal reports. Zinc spelter is another metal which is bound to go up. High prices in the European markets have driven foreign buyers to approach American producers and at present the export demand is so great that spot zinc is not obtainable from first hands, and advanced prices are being asked for futures.

All the sheet metals are being liberally inquired for, and both sheet zinc and galvanized iron have experienced higher values during the month. On the whole, the metal market has seldom been stronger than it is at present.

EDUCATION THE BASIS OF PROGRESS.

ALL progress has been due to education, whether general or specific, and so it must continue. The present status of manufacturing and engineering industry is due to the thorough knowledge of men who have done things. Every decade sees the mechanic elevated to a higher plane because of the more intelligent training he has received. Much has been done, but we have not gone far enough. Engineering colleges and technical schools have elevated the standard, but how few mechanics are personally or directly influenced by them!

The men must do much for themselves, and the possibility and practicability of this is shown in the worthy example set by the American Foundrymen's Association, whose convention was held at Cleveland, Ohio, during the first week of June. Following along the lines of the great engineering societies they have gone further than the followers of any other mechanical trade. Their watchword is "education," and the result must be progress. No man or organization can stand still under this condition. Labor troubles are not in their category and collectively they do not know of their existence. Other societies, where time and temper are spent on this subject, might profit greatly by following the example set by the Foundrymen's Association.

In his presidential address delivered at the recent convention Mr. Thomas D. West outlined the association's policy in this connection, showing what had been accomplished and what yet remained to be done. One point emphasized was the need of a more general practical education for those intending to follow a mechanical calling. Apart from this, however, the association—which means the members themselves—has done and is still performing a splendid educational campaign. The spirit of mutual assistance prevails, and knowledge, the result of individual research and effort, is freely circulated and discussed. How different this spirit from the prevailing feeling of half a generation ago when a shop kink or secret was carefully guarded in case a competitor might find it out and enjoy the benefit resulting from knowledge of the same. It betokens a forward movement, a broader and closer fellowship, and a long stride in the direction of fulfilling the golden rule. An association based on such principles with the hearty co-operation of its members possesses potential energy that no outside influence can affect and which cannot but result in being beneficial to all concerned.

THE FINISHING OF MACHINE TOOLS.

IT is undoubtedly true that a handsome appearance goes a long way towards selling a machine tool, whether the purchaser be a mechanic directly interested in the handling of the tool, or whether he be the purchasing agent for a large establishment. There are but few people lacking in that artistic sense that would lead them to look with favor upon a well-proportioned, well-finished machine tool ; and other things being equal, the handsome tool will, in most cases, get the preference, and deservingly so. Without doubt the most important features about a machine tool are absolute accuracy, simplicity of parts and strength to stand the strain to which the tool is subjected ; but while putting all the necessary stress upon these important points, the minor, but at the same time very effective, point of finish should not be overlooked. Fine finishing entails extra expense, and might of a necessity run up the selling price of the tool, but in order to compete with firms turning out finely finished tools, it is found that this extra expenditure is a good investment.

There are two chief features wherein artistic effects can best be developed in a machine tool. These are the proportioning of the tool and the finishing of the castings and machined parts. This proportioning applies to minor parts, such as handles and hand wheels, as well as to the frame or bed of the tool. Putting a fine finish on machined parts is a matter of time and finishing facilities, but the finishing of a casting should be considered in the molding shop. It is probably cheaper to take considerable care in the forming and finishing of the mold, and thus obtain a well-finished casting, than it is to finish a rough casting on the finishing floor.

It might be argued that as long as a tool is accurate, strong, and easily handled, finish does not matter, and that if a tool can be sold for a slightly lower price because of the saving in finishing costs, a common sense purchaser would lay aside sentiment and choose the cheaper tool. This would be so if it were not for the consideration that unless a firm has a very well established reputation for accurate and reliable tools, the purchaser has no guarantee that the tool he is buying is a perfectly accurate and reliable one, and is apt to think to himself that a firm who do not take the time to put a fine finish on their work, are also liable not to devote the requisite time to accurate building. This argument may not be a perfectly fair one to the builder, but the builder has to deal with human nature as he finds it, and therefore has to deal with arguments such as this one.

WHEN THE STEAM ENGINE AWAKES.

ALTHOUGH the internal combustion engine and the steam turbine have come, and have found a place as prime movers, and although the ceaseless water-fall is being made to turn the wheels of industry in a large measure, our old friend the steam engine maintains an unconcerned dignity and throbs on in spite of the intruders. It has many friends and admirers who still believe in it and who, not without reason, have every confidence in its future, for it is looking towards superheated steam and high pressure for release from its present comparatively low economy, and to these it must look for its future existence.

A prominent British engineer states it is a popular fallacy that one of the difficulties arising from the use of superheated steam is connected with lubrication. The difficulties in lubrication are really due to irregularities in superheat. At one time steam containing water passes over the lubricated surfaces, washing the lubricant from those surfaces. This is sometimes immediately followed by over-superheated steam carrying little or no lubricant with it. If the regularity of superheat is maintained the lubricant is not washed away and a small supply of it will suffice.

He believes that the time is coming when we shall use steam engines taking in the steam at 1,000 degrees temperature and at 1,000 lbs. pressure, and expanding this steam through several cylinders, possibly re-heating it in the course of its passage from one cylinder to the other ; and that when we do this, and use the right kind of boiler and the right kind of furnace, we shall be able very probably to cut down our present best figure of 2.9 lbs. of fuel of 12,000 British thermal units to 1.5 lbs., and such a figure will be very hard to beat by any form of internal combustion engine.

RATING OF GAS ENGINES.

GAS engine manufacturers in Canada have not a uniform method of rating gas and gasoline engines. This is to be regretted, for obvious reasons. It is certainly not a satisfactory state of affairs when a 10 horse-power engine from one firm means a 9 horse-power engine from another, and when either engine means actually a 6, 7 or 8 horse-power instead of the 9 or 10 horse-power. If there is any system used in rating the engines it is according to the indicated horse-power, and probably more often than not it is by the size of the cylinder. The only satisfactory way of rating is by brake test, giving the brake horse-power developed by the engine using a certain, or preferably a standard, quality of gas or gasoline. Then a purchaser buying a certain horse-power engine will know that he can develop that horse-power with the quality of gas or gasoline specified, and allowance can be made if that quality is not available.

Gas engines are rated according to brake horse-power by reliable firms in England and on the continent, a brake test being made on each engine before it leaves the works, and it would be greatly to the advantage of purchasers if this method were adopted by Canadian manufacturers.

MANUFACTURERS GETTING TOGETHER.

WHAT should lead to one of the greatest industrial organizations in the world was commenced by the combined Boards of Trade of Niagara Falls, Ont., and Niagara Falls, N.Y., when they recently invited representatives of the manufacturing interests from Canada and the United States to meet and visit the various works on both sides. It is proposed to make this an annual affair, but in which the manufacturers as a whole will be in closer connection. With an annual meeting of this kind where the manufacturers of the two great countries are brought in close contact, questions of mutual and reciprocal interests should be discussed. Matters of tariff and questions concerning methods and materials of manufacture could be brought up and agreements arrived at as to most advantageous methods for the industries of both countries. With the manufacturers of the two countries in unison on certain points the respective Governments could hardly fail to listen favorably to petitions from them, provided they were in harmony with the interests of the masses. Now that the matter has been fairly launched it should not be allowed to drop, and those who took the initial steps should see to it that a great organization is effected having for its object the discussion of broad industrial problems, conducted after the same manner as the great engineering societies.

American Foundrymen's Association

The Eleventh Annual Convention — Interesting Exhibits of Foundry Machinery, Equipment and Supplies a Feature

A JOINT convention of the American Foundrymen's Association and the Associated Foundry Foremen was held at Cleveland, Ohio, June 4 to 7, and proved to be the most successful in the history of the organizations.

Associated Foundry Foremen.

While this was held in the armory, commencing on the 5th inst., the business session of the fourth annual convention of the Associated Foundry Foremen was held at the American House the evening before with President David Reid, of Hamilton, Ont., in the chair. Apart from the regular business of the association the most noteworthy feature of the meeting was the unanimous decision by the members present for the closest adherence to the constitution, which stated that its objects be solely educational and that any local organization not conforming to this be adjudged in bad standing and forfeit its charter. Officers were elected as follows: Hugh McPhee, Eaton, Cole & Burnham Co., Bridgeport, Conn., president; Hugh McKenzie, American Shipbuilding Co., Cleveland, first vice-president; A. T. Williams, Enterprise Mfg. Co., Philadelphia, second vice-president; F. C. Everett, J. L. Mott Iron Works, Trenton, N. J., secretary and treasurer.

Joint Meetings.

The Cleveland armory, in which the meetings were arranged for, was devoted along both sides and ends and for some space in the main building to the numerous and attractive exhibits of various foundry machinery and supplies.

At the opening meeting, Thomas D. West, the president, gave an interesting address on "The Need of a Practical Education," which was both inspiring and instructive. Following the reports of the president and secretary-treasurer, a paper by W. K. Barrows, Sharpville, Penn., on "Influences of Different Ore Mixtures on the Resultant Pig Iron from the Standpoint of the Foundrymen" was read. At the afternoon session the secretary read the following papers: "The Beneficial Effects of Adding High Grade Ferrosilicon to Cast Iron," by A. E. Outerbridge; "Twenty Years' Improvement in the Quality of Pig Iron," by E. H. Williams and E. R. Sanborn; "Development of the Thermit Process in Foundry Practice," by W. M. Carr, and "Foundry Tests of Coke," by Dr. Moldenke. Other papers read were "Recent Methods of Machine Molding," by E. H. Mumford, and "Good Molders: Why They are Scarce," by M. S. McQuillan, South Norwalk, Conn. In the evening the visitors were entertained to a vaudeville at Keith's theatre, being the guests of the local committee.

At the Wednesday morning session N. W. Shed, Buffalo, read an address on "Foundry Fluxes," and Dr. Richard Moldeke made a report on "The Testing of Coke Made by the U. S. Fuel Testing Plant at St. Louis."

Other papers presented were: "A Modern Pipe Foundry," by H. A. Croxton, Massillon, Ohio; "Comparative Designs and Working of Air Furnaces," by Ralph West, Sharpsville, Pa.; "Multiple Molds," by James K. Webb, Elkhard, Ind.; "Electricity in the Foundry," by F. L. Antisell, Perth Amboy, N.J.; "A Talk on Alloys," C. Vickers, Milwaukee; "Toilet Room and Sanitary Applianees for the Foundry," by Henry M. Lane, Cleveland, Ohio.

In the afternoon the delegates were taken on special cars to the plants of the Brown Hoisting Machinery Co., the Wellman-Seaver-Morgan Co., and the Electric Controller & Supply Co., followed by a visit to the Case School of Applied Science where the afternoon session was held.

On Thursday the party journeyed to Lorain, a thirty-mile trip by boat, where the final meeting of the association was held, the occasion being a visit to the works of the National Tube Co. A paper was read by D. M. Loudom on the subject of "Ore Mixtures and Compounds." On the subject of "Costs" papers were presented by Kenneth Falconer, of Montreal, his topic being "Uniform Practice in Foundry Cost Finding" and "The Correct Application of True Burden to Iron Costs," by E. M. Taylor, Boston.

The officers elected were: President, W. H. McFadden, McIntosh, Hemphill & Co., Pittsburg, Pa.; secretary-treasurer, Dr. Richard Moldenke, Watchung, N.J. Vice-presidents: New England, 1st district, C. J. Caley, Russell & Irwin Mfg. Co., New Britain, Conn.; New York and New Jersey, 2nd district, John W. Burr, Brook & Houston Co., Brooklyn, N.Y.; Pennsylvania, 3rd district, Stanley G. Flagg jr., Stanley G. Flagg & Co., Philadelphia; Ohio and Illinois, 4th district, J. H. Whiting, Whiting Foundry & Equipment Co., Harvey, Ill.; Michigan, 5th district, W. J. Keep, Michigan Stove Co., Detroit, Mich.; Minnesota and Wisconsin, 6th district, Thomas Sheriffs, Sheriffs Mfg. Co., Milwaukee, Wis.; Southern States, 7th district, J. B. Golden's Foundry & Machine Co., Columbia, Ga.; Canada, 8th district, L. L. Anthes, Toronto Foundry Co., Toronto.

The retiring officers and members of the Cleveland entertainment committee were extended hearty votes of thanks. A rising vote of thanks was also given Dr. Richard Moldenke, secretary-treasurer of the association, for his untiring efforts on the organization's behalf.

On invitation of the Philadelphia Foundrymen's Association it was decided to hold the next meeting at the city which will in all probability be followed by a meeting in Toronto the year after.

A smoker embodying unique features was held in the armory. Apart from the vaudeville entertainment, which was provided, interest was centred around a large cupola of the Whiting Foundry Co. Chicago, from which liquid refreshment was drawn and served by waiters from foundry ladles. Each guest was provided with a souvenir stein, tobacco pouch and pipe, supplied by the association, while Mr. Geo. H. Wadsworth, of the Falls Rivet & Machine Co., presented each with a leather cigar holder containing a number of high-grade smokes.

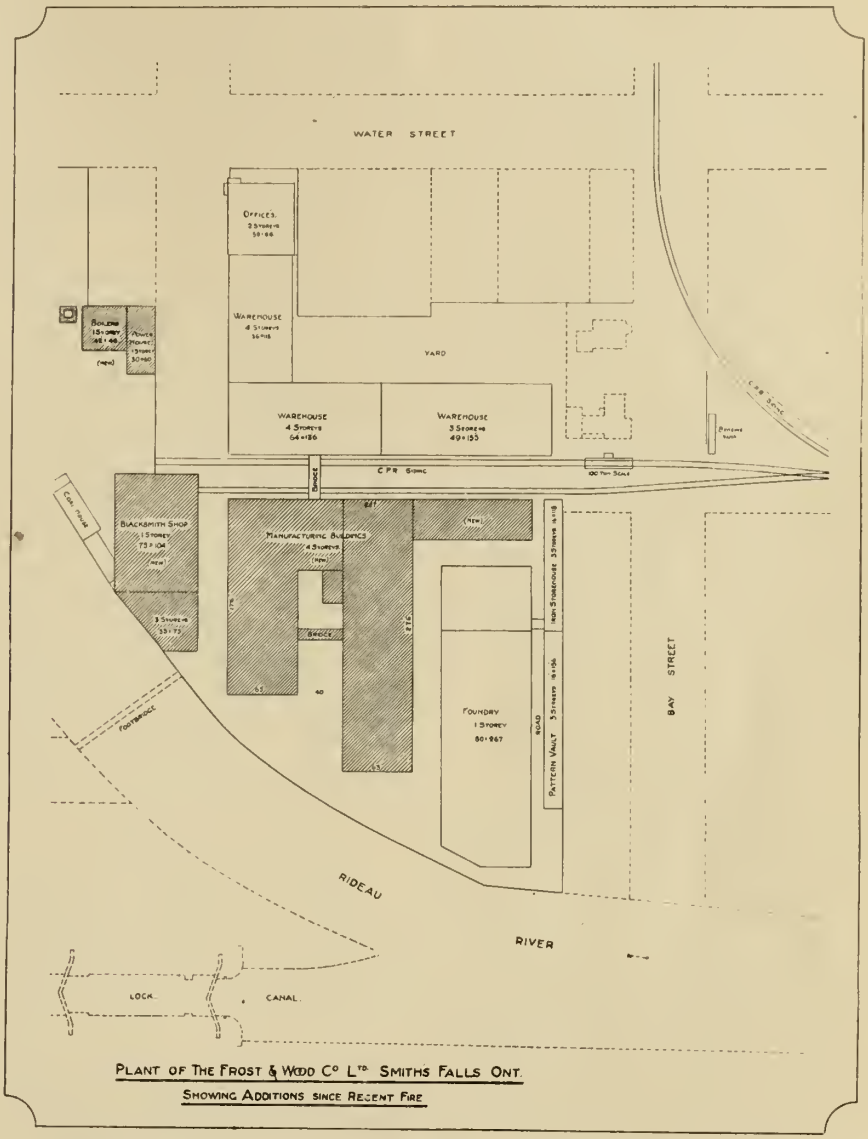
The Exhibition Feature.

Much of the credit for the unparalleled success of this convention is due H. M. Lane, editor of the Foundry, who worked in a ceaseless manner to complete and bring to a successful culmination the various events and features of the convention, which showed not only a large amount of planning, but much executive ability. An association was formed with a view to making the display of foundry supplies and equipment a permanent feature of the convention, called the American Foundrymen's Supply Association. The officers elected were: President, S. C. Johnston, Chicago; vice-president, C. H. Mumford, Philadelphia; 2nd vice-president, E. A. Koepler, Pittsburg; secretary-treasurer, H. M. Lane, Cleveland.

The exhibitors included:

American Sand Co., Columbus; molding sands; represented by F. A. Downard and A. R. Tingle. Arcade Mfg. Co., Freeport, Ill.; molding machines; represented by F. N. Perkins. Atlas Car & Mfg. Co., Cleveland; industrial tracks and railroad equipment; represented by

T. A. Williams, jr. Berkshire Mfg. Co., Cleveland; molding machines in full operation; represented by R. H. York and A. N. Battenfeld; souvenir, paper weight. Adam Brandon, Detroit; fireproof molders' shoes; represented by Adam Brandau. Bruce-Meriam-Abbott Co., Cleveland; 55 h.p. gas engine in operation; represented by A. E. West. Buckeye Milling Co., Cleveland; dry core compound; represented by R. A. Tidball. Buckeye Sand Co., Pittsburg; molding sands; represented by Ira E. Bixler and Walter Rutson. Chicago Pneumatic Tool Co.; chipping hammers, sand rammers, air compressors and hoists; represented by C. T. Smith. Chisholm & Moore Mfg. Co., Cleveland; chain hoists and I-beam trolleys. Cleveland Chaplet & Mfg. Co., Cleveland; wrought iron chaplet and chaplet stems; represented by W. A. Cronenberger. Cleveland Wire Spring Co., Cleveland; steel "tote" boxes; represented by J. W. Campbell. Connersville Blower Co., Connersville, Ind.; blowers; represented by R. T. Huston. Crystal Fluorspar Mining Co., Cleveland; lump gravel and ground fluorspar, lead and zinc. E. A. Dempwolf & Sons, York, Pa.; hydrofluoric acid. Detroit Foundry Supply Co., Detroit; galvanized rim riddle and foundry supplies; represented by E. J. Woodison, L. A. Crandall, W. K. Beers and W. Bruce Howard. Diamond Clamp & Flask Co., Richmond, Ind.; snap flasks and clamps; represented by W. N. Gartside. Wm. Dobson, Canastota, N. Y.; molders' tools; represented by Wm. Dobson; souvenir, aluminum rule. Electric Controller & Supply Co., Cleveland; lifting magnet in full operation; represented by W. A. Ten Winkle. Falls Rivet & Machine Co., Cuyahoga Falls; core room equipment; represented by George H. Wadsworth; souvenir, cigar case. Goldschmidt Thermit Co.; exhibition of welding by the thermit process; represented by Ernest Stutz and A. M. Guenther. Harbison-Walker Refractories Co., Pittsburg; fire brick and cupola blocks. Herman Pneumatic Machine Co., Zelienople, Pa.; jarring molding machine; represented by H. C. Herman; Holland Linseed Oil Co., Chicago; core compound; represented by C. B. Baumgartner. Interstate Sand Co., Cleveland; molding sands; represented by H. C. Koontz, F. E. Gordon, L. K. Brown, E. M. Ayres and V. E. Kenavel; souvenir, leather card case. W. W. Lindsay & Co., Philadelphia; chaplets and anchors; represented by J. I. Fasy; souvenir, paper weight. C. E. Mills Oil Co., Syracuse, N.Y., represented by H. E. Mills and W. E. Baird; souvenir, trick match box. Monarch Engineering & Mfg. Co., Baltimore, Md.; Harvey metal melting and refining steel furnace, rivet heating furnace, blowers and air compressors; represented by James V. Martin. Municipal Engineering & Contract Co., Chicago; represented by W. J. Rosebery, jr. J. S. McCormick Co., Pittsburg; foundry supplies; represented by T. E. Malone; distributed handsome booklet. S. Obermayer Co., Cincinnati; foundry supplies; represented by E. D. Frohman and S. T. Johnson; souvenir, postal card. Osborn Mfg. Co., Cleveland; foundry brushes, mallets and other supplies; represented by E. F. Streich; souvenir, clothes brush. E. H. Mumford Co., Philadelphia; molding machines; represented by E. H. Mumford and J. H. Rathbone. Thomas W. Pangborn Co., New York; foundry equipment and supplies; represented by J. B. Bothan. Republic Belting & Supply Co., Cleveland; belting and supplies; represented by S. C. Cutler. W. W. Sly Mfg. Co., Cleveland; cinder, tumbling and resin mills and dust arresters; represented by W. W. Sly; souvenir, pocket book and cigar case. J. D. Smith Foundry & Supply Co., Cleveland; Blundell pneumatic sand shaker and foundry supplies; represented by J. S. Smith, P. S. Smith, Milton Finley and Fred A. Coleman. Standard Sand & Machine Co., Cleveland; mixers, dryers, screens and elevating machinery for foundry; represented by H. G. Boughton and W. H. Smith. B. F. Sturtevant Co., Boston; high pressure blowers; represented by W. H. Coleman. Tabor Mfg. Co., Philadelphia; molding machines; represented by J. W. Dopp. Western Foundry Supply Co., East St. Louis, Ill.; ground ferromanganese and foundry supplies; represented by J. A. Rogers; souvenir, one pound bags of ground ferromanganese. White Tool & Supply Co., Cleveland; pattern making, tools and equipment; represented by F. C. White. Whiting Foundry & Equipment Co. Harvey, Ill.; Whiting cupola; represented by S. T. Johnston.



Plan Showing General Scheme of Frost & Wood Plant at Smith's Falls, Ont.

MACHINE SHOP EXTENSION.

In the last issue some details of the large new machine shop of the Frost & Wood plant at Smith's Falls were given. Herewith is shown a diagram of the new works, the general plan of which will be readily seen. Everything connected with the new plant and its equipment is to be of the most modern type.

Antimony and its Uses

By James G. Lorriman.

IN view of the ever-increasing consumption of antimony, and the threatened depletion of the world's supply, it seems remarkable that there are very few men, even in the business of selling that metal, who are familiar with its nature. But now that its price has reached four times the normal quotations a greater interest in the subject is being aroused, and an anxiety is shown to learn more about antimony in order to more thoroughly understand market conditions.

Antimony is a white and very brittle metal which, so far as known, is not used in the pure state, but is valuable as forming several valuable alloys and compounds. It is a peculiar product, as deposits of the crude ore are not found in the same way as lead, silver and the other better known metals. Antimonial ores are not deposited in strata which can be traced and their probable output estimated. On the other hand, they are discovered in mere pockets, which are liable to play out at almost any time.

Nature of the Ore.

The chief ore from which antimony is derived is the sulphide, which is known as stibnite or grey antimony, and which, when pure, carries 71.4 per cent. of metallic antimony. A considerable proportion of the world's output is also furnished by another ore, called stibiconite, or antimony ochre, which is an oxide, and contains 74.5 per cent. of antimony. The process of smelting and refining these ores to produce antimony regulus, the standard form in which the mineral is used, is a very complex and expensive one. It depends very largely upon special conditions, which prevent the exploitation of some small deposits of the ores in countries other than those which now furnish the chief basis of supply.

Sources of Supply.

The largest known deposits of antimony are in Spain, Portugal, and certain parts of South America. There are some small deposits of ore in Nova Scotia, but these have never been exploited. The Chinese have not been mining their ores for some time past, consequently it has been difficult, if not impossible, to purchase any quantities of the metal in Japan, practically all the Japanese antimony being refined from Chinese ore. Whether the wily Chinese are, for commercial reasons, husbanding their resources until prices have gone even higher, or whether their deposits are actually playing out, is something that Europeans have been unable to find out. It would not be surprising to learn that this latter is the case, for beyond a doubt all the other known deposits of antimony are being very rapidly exhausted, and already an end to the supply is seen. As a matter of fact, the production in 1905 was more than fifty per cent. lower than in 1904.

No substitute for this metal has ever been devised. As has been shown, the visible supply is being depleted at an alarming rate, and to accentuate the difficulty many new uses for the metal are being found. The whole question now hinges on the possibility of discovering new deposits of the ore. The pockets have not only to be found, but also developed, so that at the least another year must elapse before the present situation is relieved.

Uses of Antimony.

As has been mentioned, antimony is used solely in the form of alloys and compounds. Its chief importance arises from the fact that it hardens lead and kindred metals. It is largely used for britannia, pewter, babbits, and type metals, perhaps the largest proportion being consumed in these products. But increasing quantities are being purchased by the leading governments for war ammunition purposes, including the manufacture of smokeless powder and the hardening of bullets. The Japanese used large quantities during the recent war, and a severe drain was made upon the market within the past few weeks, when the Russian Government placed orders for about six hundred tons.

Antimony Prices.

In considering the figures quoted on antimony since the year 1900, we have all the more cause to wonder at the remarkable flight which began last Fall, and has not yet reached its limit.

The current price in Montreal for January, 1900, was 10¼c., with the market very quiet. During the next several months conditions were slightly better, and 10½c. was the price quoted. The latter part of October developed a little flutter which sent the price to 11 and 11½c., but it declined to 10c. in November, and the year closed with this figure ruling.

In 1901 the situation throughout was even quieter than in the preceding year, the price of 10c. being maintained steadily, with the exception of ½c. advance in April. The year 1902 opened with quotations still 10c. per pound. In October the market weakened, and the price declined to 9½c., while November witnessed another slump of ½c. A temporary recovery to 10c. was effected in the early part of December, but 9c. was again the price quoted at the end of the month.

In the year 1903 the price of 10c. was steady during the first half, but a falling off occurred during the closing months, so that January, 1904, showed a price of 8c. In May a slight weakening was noticed, the minimum price declining to 7¾c., which became the ruling quotation in June. Another drop in July resulted in a price of 7½c. being given, and this was maintained until the middle of November, when a startling advance in the Old Country boosted the Canadian quotation to 9¼c.

The opening months of 1905 showed little change in this price. In February the price given was 9½c., and there it remained until May, when there was a decline of ½c. About the middle of June the beginning was made in that period of advancing prices which still continues. Prices climbed steadily until September, when the record price of 16c. was obtained. A temporary weakness then developed, quotations falling off to 14¾c., and finally to 14c., which was the figure quoted at the close of the year. At the very beginning of the present year figures began to soar, and a steady upward movement has been continued ever since. The price now is hovering around 30c. per pound—just about four times the figures quoted but two years ago.

Nor can we hold out much hope of altered conditions in the near future. Even if new ore deposits are found promptly it will take at least a year to develop them, and in the meantime prices must be arbitrary and well nigh prohibitive. No orders are now being taken by the leading Canadian merchants for delivery earlier than September, and even at that the import price is such that jobbers will still be compelled to ask from 30c. a pound up. Indeed, very little surprise will be felt if 35c., or over, is reached.

Trade Paper Advertising

By Converse D. Marsh

IT is easy enough for anyone to record the fact that trade paper advertising has made material advances during the past ten years, and has made specially marked improvement during the past five years.

I do not believe that, notwithstanding all that has been done, a tithe of what is possible has been accomplished.

House organs flourish; special methods of advertising have increased appropriations to the detriment of the trade press, and back of all this, the large manufacturers throughout the country—capitalists who control—give scant attention to the question of trade paper advertising, and secretly have little respect for it, nor do these prime factors in the advertising appropriations believe that their interests can be materially advanced by liberal publicity in the chosen organs of their trade.

The impulse of every large publisher will be to rise up and dispute this statement, but if he does so, let our friend, the disputant, review the fact that trade paper advertising expenditures by our large manufacturers are but minute, fractional portions of the total sum expended for selling the factories' products.

In several instances of which I have knowledge, the large manufacturing corporations spend, for advertising appropriations, less than one-tenth of one per cent. of their gross sales!

Large fortunes are being made by publishers in the field of general publicity, while comparatively small ones are earned by publishers in the specialized or trade journal field.

The makers of the popular magazines can complacently cross their legs and say that this is not only as it should be, but that it is inevitable, while, on the other hand, trade paper publishers do not seem to have had the spirit to make matters better for themselves. They, too, believe that the comparatively small position that they occupy is a reasonable one.

Things are not reasonable, merely because they exist.

The complacency of the big brother may be all right, but I do not believe the acquiescence of his financially lesser kindred is.

A little seething unrest should stir the gentle soul of the trade-paper owner.

Why should the monthly, or weekly, created to amuse people, be a wonderful money maker while mainly it advertises cheap, inconsequential things, while the trade paper, the serious exponent of heavy financial interests, is relegated to an obscure corner in the congregation of publications?

The popular magazine reaches hundreds of thousands where the trade paper reaches tens of thousands, but the goods offered for sale, and really sold, through the influence exerted by many trade papers, largely exceeds the volume of trade sold through the influence of the prominent, popular magazines.

If Postum Post was at the head of some great steel company, wouldn't we see the fur fly in the advertising he did, say in the Iron Age or the Engineering Record?

If the General Electric Company was owned by the Uneeda Biscuit crowd, what a serious factor advertising in the Electrical World would become.

In the steel and iron business of this country I venture to say that the proportion spent in advertising to influence sales would be but an infinitesimal part of one per cent. of the amount of the sales.

Without the means of breaking into the archives of the gentleman who is swaying American breakfast destinies from the magical precincts of Battle Creek, I do not think I will be gainsaid in my estimate that nearly one-half of his total revenue is expended for publicity.

The sales of the General Electric Westinghouse, and the Allis-Chalmers interests alone, in the electrical world, must in combination represent over one hundred millions of dollars per annum.

I wonder, if the gentlemen controlling these electrical giants combined, are spending the insignificant sum of fifty thousand dollars per year with the trade papers?

Can it be that the seller of trifles, logically should spend hundreds of thousands of dollars, whereas, the really large business interests, having a much wider field, think they have exhausted the possibilities when they have expended a few pitiful thousands?

Does the reason for this lay accusingly at the door of either the trade paper publisher, or his customer, or should the burden of accusation be shared impartially by both. Somebody has got to shoulder it.

To my mind, neither the publisher, nor his advertiser, have yet grasped the latent opportunities that exist in trade paper publicity. It is the duty of the publisher to show these possibilities to the manufacturer if the latter cannot spare the time to study them himself.

In some lines, one single trade publication reaches practically every buyer in the field—every man who can influence an order—and yet the advertiser with millions of dollars of possible sales, is content to merely play with the trade paper advertising proposition.

What likewise shall be said of the lack of advertising by the thousands of smaller manufacturers of machinery who could be benefited even more than the few large manufacturers by a greater amount of, and more intelligent, publicity?

Speaking broadly, I don't believe that the presidents and board of directors of our average manufacturing corporations, give five minutes' heed a year to trade papers, or what the trade papers can do for them. They are content to spend a few thousand dollars in advertising account and let it go at that. They show that they have no respect for their publicity departments, because the salaries of the managers of such departments are invariably the lowest paid heads by many thousands of dollars of any departments maintained, and the advertising counsellor is indeed a rara avis.

They think enough in other directions about making sales, but no single force in the trade paper field has yet grappled with them, struck them squarely between the eyes, and made them sit up and take notice that a great force was at their door—a wonderful force and factor that could be utilized in increasing their sales. Because in the multitude of their duties the heads of manufacturing organizations omit any consideration of advertising, will the publishers of the trade press be content to maintain the position allotted them?

Let the trade paper brother gird up his loins, and himself carry the war into Africa, if I may be allowed to so quickly shift my suggestion.

In plain, practical, every-day English, I would say that it is up to the trade paper publisher to himself devise selling plans through publicity, and bring them to the attention of his customers, big and little.

Then too, let him make his reading columns more attractive to the real people who buy the kind of goods that his advertisers have to sell. This makes an abrupt termination but it contains enough of thought to induce me to cease writing.—Printer's Ink.

Chemical Action in Boiler Feed Waters

By J. A. DeCew, Chemical Engineer

IF water were simply a compound of hydrogen and oxygen, as its chemical formula represents, the difficulties and troubles which so often arise when it is put to industrial use could never exist.

Water in nature produces the chemical phenomena of corrosion and detrition, and in processes of manufacture a like phenomena is often reproduced, which has as one of its final results, explosions. Water in forming seizes hold of the various surrounding atmosphere constituents and before it reaches the earth it has already absorbed a considerable amount of oxygen, nitrogen, carbonic acid, nitrites and ammonia. Aided by these dissolved gases, and especially the carbonic acid which it continues to accumulate, this rain water attacks the mineral constituents of the earth over which it passes, and is able to carry in solution a portion of the more soluble salts with which it has come in contact. A substance showing such vigorous action in nature is not necessarily dormant in industrial use, and as experience has shown, it is sometimes able to get away with substances which have a maximum of resisting power.

A water charged with carbonic acid gas has a strongly corrosive action on limestone rocks, the gas holding just so much of the rock as will combine with it to form calcium bicarbonate. If the gas is taken out of the water by any means, the limestone drops out of the solution again and when this occurs in nature, a new limestone rock is formed. In industrial operations the result is exactly similar, for if we remove the gas by boiling, the limestone rock, not being able to escape with the vapor, must remain in the boiler, and attaches itself firmly to the surfaces with which it comes in contact.

This process is well exemplified in nature, in the stalagmitic deposits of limestone caves where layer upon layer of stone is formed by the gradual percolations of lime-charged waters.

Not only does water dissolve limestone rocks, but also compound carbonates, such as dolomite, which is a carbonate of calcium and magnesium. If the quantity of calcium carbonate held in solution exceeds .5 gramme per litre, the water is called a carbonate water, and the readiness with which this salt is precipitated forbids its use in many industries.

Waters generally carry more than carbonates in solution, especially when they come in contact with beds of gypsum or pass over a limestone carrying pyrites. In the latter case the sulphur becomes oxidized to sulphuric acid, and attacks the limestone, forming calcium sulphate, which then dissolves in water. Such waters are generally known as sulphate waters, when the proportion of calcium sulphate is over .20 grams per litre. The limit of solubility of calcium sulphate in water is reached at about 2 grams per litre. This is a factor which varies with conditions, however, for the presence of alkaline chlorides or nitrates will increase the solubility of calcium sulphate, and its solubility also increases with concentration. On the other hand, the presence of carbonic acid or sodium chloride will decrease its solubility.

There are many other salts that find their way into natural waters, such as the chlorides, calcium, magnesium and sodium, sulphides, sulphites and nitrates. These are either corrosive or incrusto-corrosive, and offer many dangers and difficulties when we endeavor to use them for steam production. When the acids are not present themselves in the free state, they are often liberated from their combined condition by the interactions and decompositions which take place amongst these salts under the energizing influence of temperature and pressure.

Corrosive Waters.

That waters containing free sulphuric, nitric or hydrochloric acid are dangerously corrosive is a fact generally recognized. But that their corrosive action is continuous and the salts they form when neutralized by the iron of the boiler are also very corrosive, is not so generally understood.

By way of illustration let us follow the chemical changes that take place through their cycle of reactions.

$3\ Fe\ Cl_2 + 4\ H_2\ O = Fe_3\ O_4 + 6HCl.$

$2\ HCl + Fe = FeCl_2 + 2H.$

$6\ FeCl_2 + 3O = 2Fe_2\ Cl_6 + Fe_2\ O_3.$

$Fe_2\ Cl_6 + 3H_2\ O = Fe_2\ O_3 + 6HCl.$

We thus see that whether the ferrous chloride becomes oxidized or not, we have as a final product the hydrochloric acid with which we started, and a deposit of oxide of iron.

What difference will it make, therefore, in the chemical results if we start with the ferrous chloride in this cycle of reactions instead of the hydrochloric acid itself?

Ferrous sulphate and ferrous nitrate produce analogous reactions.

Chlorides.

Other chlorides may enter this corrosive cycle of operation by indirect means, on account of the fact that they are readily decomposed. Magnesium chloride is one of these, thus $MgCl_2 + H_2\ O = 2HCl + MgO$. The hydrochloric acid is then ready to begin its work.

Sulphate of magnesium is a salt which in itself is harmless to boiler plate, but in the presence of a chloride it becomes actively corrosive. If we let the former XCl represent any chloride, then $MgSO_4 + 2\ XCl + H_2\ O = MgO + X_2\ SO_4 + 2HCl.$

We get a corresponding sulphate and hydrochloric acid again. When chlorides and magnesium carbonate meet in a boiler, we arrive at a similar result.

Rather an unexpected reaction is that which takes place between sodium chloride and silica in presence of steam. $SiO_2 + 2NaCl + H_2\ O = Na_2\ SiO_3 + 2\ HCl.$

This shows what may happen in boilers using sea water, or where salt is used as a curative agent.

Amongst the corrosive sulphates we may mention sulphate of alumina and sulphate of copper. Under the influence of heat, either of these substances will liberate free sulphuric acid, in the first case basic sulphate of alumina being deposited, and in the second case metallic copper.

Sulphides.

The sulphides of the alkalies and alkaline earths are easily decomposed under certain conditions into the oxide of the metal and sulphuretted hydrogen, the latter becoming finally oxidized to sodium thiosulphate, commonly known as hypo. The reaction may be expressed as follows:

$4Na_2\ S + 4H_2\ O + O = Na_2\ S_2\ O_3 + 6Na\ O_4 + H_2\ S + S.$

Hydrogen sulphide may also be formed in the steam boiler by the reducing action of organic matter on any sulphate present.

$CaSO_4 + 4C = 4CO + CaS.$

The calcium sulphide decomposes, liberating hydrogen sulphide, which then becomes oxidized to sulphuric acid. The sulphuric acid then sets up the cycle of corrosive reactions already described.

Sulphites.

When sulphurous acid or sulphites obtain entrance to a boiler, they are not long under the action of the steam until they are oxidized to sulphuric acid. When ferrous salts, the sulphurous acid will reduce them to the ferrous condition and liberate the acid at once.

$$Fe_2\ (SO_4)_3 + H_2\ SO_3 + H_2\ O = 2FeSO_4 + 2H_2\ SO_4$$

The dangerous possibilities of this reaction are too evident for further comment.

It is a generally known fact that water often carries quantities of nitrates which it has dissolved from the soil. But this is often overlooked in inquiring into the causes of corrosion. Ferric nitrate is particularly corrosive, for in reaction with other salts, its nitric acid is set free. Chlorides and nitrates together may result in the like action of both HCl and HNO_3, and the results of this "aqua regia" may be readily imagined. A table of the reactions which produce acids in a boiler is a long one, and these would only indicate the beginning of the corrosive chemical changes.

The results of this chemical activity all tend to build up new business for the boilermaker, and therefore cannot be considered a universal evil, although the number of lives yearly sacrificed in the change from the old boiler to the new is a factor which should be of some importance.

The reason that so little thought is given to this subject by many steam users is that the complexity of the problem is not apparent, and when a remedy is applied it is generally an overhead treatment which is applied to all cases alike, without regard to chemical reactions which will take place in the boiler or the resulting products.

A proper solution of any problem of this kind cannot be obtained without first obtaining a knowledge of the chemical constituents contained in the water, and then the work has just begun.

Very little has been said in this article regarding the effects of incrustation which often take place simultaneously with corrosive action, but this aspect of the question has been so generally discussed that further reference to it is almost unnecessary.

There are very few manufacturers now who feel like paying for 20 per cent. of lost fuel when a remedy can be found for this leakage.

Tendencies in the Foundry Industry *

Economy of Room.

APART from the use of molding machines to turn out larger numbers of castings cheaply, there is a noticeable tendency to economize shop room, and hence molds are piled as high as they can be conveniently poured. It may be objected that this method oftentimes produces more sprues per pound of casting than the old way, and that if trouble comes a stack of molds will be ruined instead of only a single one. Yet this system has been found to pay wherever tried, and the getting of more tonnage for a given floor space is bound to spread. The idea, however, should be followed out to its logical end wherever work is made of sufficient quantity. This would seem to be the stacking up of the molds in fairly deep foundry pits, the iron being wrought in large ladles by traveling crane, and poured from the bottom of the ladle. Suitable variations in the method can naturally be devised for given cases, but the idea remains the same; to get the greatest tonnage for a given floor space, in order to save investment and cost of output.

Preparation of Molding Sand.

Greater attention will ultimately be given the preparation of the molding sand. Our European brethren are far ahead of us in this respect, every foundry of importance grinding its sand to a given standard, then passing it through mixers which incidentally fill the perfectly uniform material with a maximum of air, thus cushioning the sand and keeping it as open as it may be. When a highly refractory molding sand is used, this treatment assists in turning out the smoothest kind of work. As our consumers are constantly harping on better looking work, this point might be considered more carefully by American foundrymen. Many sands are exceedingly uniform in their natural state, as, for instance, the well-known "Albany," the result being highly finished castings, where the best molding methods are employed. On the other hand, who does not recognize a "Pittsburg" casting; that is, one made in the sand dug in the inviron-ments of the smoky city. Judicious sand treatment would go a great ways to remedy the difficulty even here, did the good people make the class of work current in the eastern states. What great differences may exist in molding sand in the same heap may be seen in an exaggerated way where sand conveyors are in use. Here, unless special precautions are taken, the loamy particles in the sand may get together, leaving the silicious portions without a binder. The result is that copes drop out, scabs are formed, etc.

Accessories and Standards.

Before leaving this branch of our subject, we must not forget to mention the growing tendency to perform as many operations about the foundry as possible by mechanical means. We have now some excellent examples of what may be done in this way in our advanced foundries. Whether it be the mechanical charging of the cupola, the mold and sand conveyors, metal distribution, compressed air attachments, yard cranes, and the like, the tendency is to be encouraged as much as possible, as whenever the manual labor of several men can be replaced by the brains of only one, conditions of management are much easier to meet. The investment may become higher, but competition can be better met, and as a general proposition the resources of the nation are employed to its greatest advantage.

Perhaps this is as good a place as any to mention the growing demand for foundry standards. Thus flasks, pattern work, and the molding methods depending upon the close co-operation of the pattern shop with the molding floor, are coming in for considerable attention. The makers of molding machines will be greatly benefited by this desired standardization of flasks, for the time has now gone by when a manufacturer would go out of his way to get the most impossible screw thread in order that the repairs subsequently necessary would have to some to him. We shall undoubtedly see the day when all the designs of the drafting office of an industrial establishment will go for revision to its foundry superintendent in order to standardize the non-essential elements therein and create less labor in producing the castings.

We owe much to our high-class custom pattern shops for the progress they have forced upon the pattern end of our industry. It is not so long ago that metal patterns were unheard of in many foundries. It seemed like a waste of good money to put more time and effort on a pattern than was required by the ordinary article we all have piled on our pattern shelves. However, this tendency is growing steadily, and many a shop to-day can boast of a set of metal cutting machines which remind one of a first-class tool-room. This tendency is, however, closely interwoven with the specialization of the foundry, and where a first-class man is in charge the pattern storage room becomes less of a graveyard for obsolete material.

*A paper recently read before the New England Foundrymen's Association, by Dr. R. Moldenke, gives a survey of modern practice, part of which is given.

*Industrial Future of Central Canada**

By Thos. R. Deacon, Winnipeg

"I want to say something about Central Canada, and for my purposes I shall call that part of this country lying between the meridian of North Bay, and the base of the Rocky Mountains, Central Canada. I wish to make a few remarks on the present and the future of this part of our country and some particular reference to Winnipeg. Owing to the fact that prior to the building of the Canadian Pacific Railway, that part of Central Canada lying east of Lake of the Woods was absolutely unknown and unsurveyed territory, no importance was attached to it, and since the completion of that road so great has been the development in the better known and older sections of Canada and the capital and energy of the country has been so completely utilized to their industries and the exploitation of their resources that little opportunity has been afforded to take stock of the potential resources of the part under discussion, and in fact it is only recently that serious attention has been turned that way. And yet, gentlemen, I desire to express it as my sincere conviction that from the fountain of that great wilderness will spring a lasting stream of material wealth that, dividing into two great branches, the one flowing east and the other west, shall rival the agricultural wealth of the west or the industrial wealth of the east.

Exploring New Ontario.

"In 1900 the then premier of Ontario, Hon. G. W. Ross, decided to have an exploration of that part of the country called New Ontario made, and accordingly sent out ten parties, each one in charge of a practical surveyor and including a geologist and expert timber estimator. The net result of their exploration fully justified the most sanguine expectations in regard to the natural wealth and fertility of the country. A clay belt comprising an area of at least 16,000,000 acres was discovered, nearly all of which is well adapted for cultivation. This almost unbroken stretch of good farming land, is equal in size to the twenty-two counties of old Ontario, lying west of the County of York in a line drawn from Toronto to Midland, which portion of Ontario was shown at the last census to be inhabited by a population of 1,081,000 people. This clay belt was found to cover an area as large as the States of Massachusetts, Connecticut, Rhode Island and Delaware combined and about half the size of the State of New York, or half the size of England. It was found to be remarkably well watered by numerous rivers, the principal of these being the Moose, flowing into James Bay, and its tributaries, the Abitibi, Metagami, Missanabie and the Albany, with its tributaries; the Kenogomi and Ogoki. Including all areas of good agricultural land in what is called New Ontario there is found to be 20,000,000 acres, or 125,000 farms of 160 acres each, capable of supporting a population of 1,000,000 people.

Thos. R. Deacon, Winnipeg
Manager of the Manitoba Iron Works.

Climate is Mild.

"The climate, which is the necessary accompaniment of any lasting colonization, has been found to present no obstacle to successful settlement. The vegetables found growing at the Hudson's Bay Company's posts were a living evidence of the possibilities of successful agriculture. Even at Albany post the potato tops were green on Sept. 25. On Oct. 3 the garden produce had not been removed from the ground for the Winter at Albany post. Only two nights of frost were observed up to Oct. 28.

"From careful estimates made it has been found that there is still in the crown unsold in Ontario white and red pine, which will produce at least 6,000,000,000 feet of lumber, which at present prices has a cash value of not less than $42,000,000 on the stump, which if invested at only 3 per cent. would net the province an annual income of $1,260,000. It was found also that extensive forests of spruce, jack pine and poplar existed, estimated to contain 300,000,000 cords of pulp wood, which at 40c. per cord would give the province an annual income of $3,600,000 for all time to come. From a very conservative estimate of the annual growth of pulp wood, it is found that it amounts to no less than 6,000,000 cords, or sufficient to employ 200 pulp mills continually, employing 100,000 men.

Mineral Wealth.

"I have so far spoken only of the agricultural and forest wealth of that portion of Central Canada lying east of Winnipeg; let me give you a few facts as regards the known mineral wealth, as this is more likely to have a direct bearing on the City of Winnipeg. I will briefly mention first that deposits of nickel in the Sudbury district have been found upon development to be practically inexhaustible. By means of diamond drills half a dozen of which have been used day and night for some years in one locality, millions of tons of high-grade nickel ore has been blocked out and large bodies of ore located, upon which no development has yet been done. As regards the cobalt, nickel, arsenides and silver deposits in the Temiskaming district, I am indebted to a recent report of the Bureau of Mines for some valuable information regarding this discovery. The archaean protaxis or that rocky region which stretches away from the St. Lawrence River, expanding to the northwest, is producing a group of what may be called unique or, at least, comparatively rare minerals. The nickel mines of Sudbury, which is one of the two important nickel producing localities of the world, produces with the nickel and copper, the bye-products, platinum and palladium. The corundum deposits of North Hastings and South Renfrew now supply by far the greater part of

* An address delivered before the Canadian Club of Winnipeg.

the corundum used in the world and the recently discovered cobalt, nickel and arsenides of Temiskaming district have suddenly acquired an importance as a producer of cobalt, which is only rivalled by the deposits of Saxony. As to what we may reasonably hope for from the building of the Grand Trunk Pacific road through that new region, let me remind you, gentlemen, that these great cobalt, nickel and silver deposits were discovered by the building of the Temiskaming & Northern Ontario Railway within a short distance of the shore of Lake Temiskaming, which has been a well-traveled water route to the north for over 200 years, and the Sudbury deposits were discovered by the building of the Canadian Pacific Railway. These two instances show the possibilities there are for the discovery of important mineral bearing areas in the vast hinterland of Ontario. The latest report from the Bureau of Mines of Ontario, which keeps a close record of all matters pertaining to mining in the province, show that there have actually been shipped from Cobalt already. $3,500,000 worth of silver alone. At the Pan-American exhibition at Buffalo in 1901, twenty-one awards were made to the Ontario exhibit, viz., three gold medals, seven silver medals, six bronze medals, and five "honorable mentions," a larger number than the exhibit of any state or country save Mexico alone.

Iron Deposits.

"I have yet to mention, so far as we are directly concerned, the most important of all, viz., the iron industry. A large number of very extensive and very valuable deposits of iron have been discovered in the Lake Superior region, and I have recently learned that the largest single deposit of iron ore known in the world has recently been located in this district. The iron and steel industries are the foundation of our modern civilization. To realize our dependence upon them, try to imagine what the state of affairs would be if our iron and steel industries were swept away. Transportation by railway and boat would cease; the machinery in our factories would be banished, and the comforts and luxuries of our life destroyed. We might better do without silver or gold.

"It has now been proven that the vast deposits of iron ore in Canada known these many years, but hitherto considered valueless because of their high sulphur contents, may now be utilized by the use of water power for electric smelting, with which the country is richly blessed, and this means that Central Canada can undertake for herself this basic industry of modern civilization without having to import coal or ore for that purpose. Using entirely Canadian products Canadian manufacturers will be able to make the tools and agricultural implements for the settlers pouring into the country; will be able to build the bridges and boats and railways which are required to open up still other new territories and make the machinery to be used in thousands of busy factories.

Winnipeg Should Profit.

"How does this affect Winnipeg? Shall she become really a manufacturing city of importance, with solid, stable industries, or shall she be content to remain an aggregate of people living on commissions skimmed from the stream of agricultural products flowing eastward and the tide of manufactured articles flowing westward to supply the territory to the west. That depends. Other centres with various advantages and ambitions will no doubt spring up as rivals to draw trade away and new routes may be opened up which may deflect a large part of the stream of commerce from Winnipeg.

"It is a fundamental law of the political economy of manufacture that institutions which are engaged in the production of finished goods should be located as nearly as possible, having due regard for the conditions of production, in close proximity to the point of consumption. And because the principles of that law have been misapplied it has become the habit to regard Winnipeg as a point unsuitable for manufacturing. I believe I can demonstrate that this is a fallacy and that within a very short time it will be amply shown that Winnipeg is most fortunately placed, and that once her public men are thoroughly awakened to her opportunities an era of development and expansion and solid industrial growth will dawn, the full effulgence of whose glorious noontide no man would dare predict. We live in the electric age and Winnipeg is within easy distance of an enormous source of this form of energy.

"I have for some time been giving a considerable amount of thought to this question, and a short time ago I made a rough computation, erring on the safe side, of the amount of energy available at this city from a single source, namely the Winnipeg River. I do not wish to be tediously technical; you all know that the Winnipeg River drains an immense area of country stretching from far south in the State of Minnesota, north of the Canadian Pacific Railway, and extending eastward from the Lake of the Woods, at least 200 miles.

Water Power Available in Winnipeg.

"The basin of the Lake of the Woods is over 25,000 square miles in extent. Now, all the water that can, by any possibility, flow down the Winnipeg River in any single year is the amount that has been precipitated as rain and snow for a corresponding length of time. Observation has shown the amount precipitated over this area to be about 30 inches annually. Probably one-quarter of this is lost by percolation into the soil and utilized for plant growth, one-quarter may be re-evaporated, leaving 50 per cent. to flow by conduction down the Winnipeg River. The fall from the Lake of the Woods to Lake Winnipeg is about 355 feet. A computation of this volume of water falling 355 feet gives the enormous total of 1,097,000 horse power as the potential energy of the Winnipeg River between the Lake of the Woods and Lake Winnipeg. Fairly efficient turbines will develop 80 per cent. of the potential energy of a fall and this gives us 882,000 effective horse power available for work. Allowing the extreme of 25 per cent. for loss in various ways, we still have over half a million horsepower available for actual use, which, I believe, the genius of the Canadian engineering profession is quite competent to deliver to the wheels of commerce in our factories.

"But we must have raw material, they say. Very good. Pig iron and wheat are the basis of all commerce in these days and we are planted right in the midst of the future sources of these commodities.

"I firmly believe, and I want to go on record as having expressed this opinion, that the building of the new Grand Trunk Pacific will be followed by discoveries of iron ore gigantic in extent, and this opinion is based, not on mere mental impression, but on sound scientific deductions. I feel that northwestern Ontario is on the eve of a tremendous mineral development, particularly in iron, copper, nickel and silver ore. Large smelters will be erected to smelt by electricity, using the powers of the Kaministiqua, the Nipigon, the

Michipicoten, and other rivers, and from this source Winnipeg will have her supplies of raw material.

"Our market is at our doors. Planted on the very shore of a golden ocean of waving grain fields, dotted with innumerable archipelagoes of prosperous homesteads inhabited by a people rich from the products of the soil, our material prosperity cannot fail to be very great. Since the advent of human life on this planet men have sought the end of the rainbow under which is hidden the pot of gold, and suddenly the world has learned that it rests upon the earth in the wheat fields of Western Canada, and the multitudes have set their faces thitherward. If we are the worthy sons of our sires we will avail ourselves of this heritage and continue to demonstrate to all the world that Canadians are as bold in conception, as intelligent in design, and as skilful in execution as any other race.

"Canadian brawn and Canadian brain have achieved things in the past, and have overcome difficulties that to a less vigorous people might seem insurmountably stupenduous. But our reward is near if we but devote our energies to building up our manufactures side by side with our agricultural development, not in conflict, but in harmonious combination, so that all the various occupations of our people shall be interwoven for the general good of all, so that all shall be peacefully and happily employed in the various acts of agriculture, commerce and of manufacture."

*Experiments on Strength of Cast Iron Machine Parts**

By Prof. C. H. Benjamin

CAST iron and steel are to-day the most important materials in the manufacture of machinery, iron for frames and for those parts which are exposed principally to compression, steel for the simpler shapes which carry the tension and strain. Cast iron is a material notably weak in resisting tension and for that reason it is more or less an uncertain quantity where bending is concerned.

In so simple a thing as a cast iron beam of rectangular section theory is more or less at fault in predicting the safe load. A series of experiments which I conducted several years ago showed me that the neutral axis of such a section was not stationary, but traveled gradually up from the centre of gravity as the load increased. As the sections become more complicated the stresses due to the uneven cooling begin to appear and to still further embarrass the designer.

I long ago came to the conclusion that as far as this material is concerned we must obtain our formulas and take to experiment. Accordingly, in the past dozen years I have conducted tests in the laboratory of the school on a great variety of cast iron members to determine the actual breaking load or pressure and compare it with that deduced by theory. There were tested in this way beams of various sections, cylinders, wheels, flat plates, gear teeth, pulley arms and rims, fly wheels, rotary discs and high speed pulleys of various types.

The tests on the cast iron beams of various sections were made in 1901 and 1902. Experiments on the bursting strength of cast iron cylinders similar to those used in steam engines have been carried on from time to time. It has been found that such cylinders usually break in a circular line just back of one of the flanges instead of splitting, as theory would indicate. Furthermore, the failures occur at pressure less than one-half those given the usual formulas for their shells. This is probably due to pressure of blow holes or hot spots at the junction of shell and flange and to the bending moments caused by the pull of the cover bolts. Subsequent tests on cylinders whose flanges have been reinforced by brackets substantiate this conclusion.

The cylinders all split from end to end under a pressure approximately two-thirds that given by the formula for their shells. The other third is accounted for by the bending due to lack of uniformity in the metal. A cylinder 10 x 20 inches, with a 3-4 inch wall, would burst at a pressure of about 1,400 lbs. per square inch, corresponding to a tensile stress of 10,000 lbs., whereas tensile tests showed the metal, a soft grey iron, to have a tensile strength of 14,000 lbs. The bursting of several of the cylinder heads under the pressure suggested the idea of testing flat plates in a similar manner.

At this point Prof. Benjamin was asked to state the manner in which the cylinders upon which the experiments were made were cast. He said he was not advised what method was used, but several of the foundrymen believed that the blow holes below the flange could be easily avoided if properly cast.

Continuing, he said: Both rectangular and square plates were tested and the results were found to be remarkably uniform. The bursting pressure varied less than 10 per cent. from that calculated by accepted formulas. The tests on gear teeth were made by applying a steady load on the testing machine, and were only conclusive as to the selection and not the absolute strength of different forms. The pressure was applied at various angles of obliquity, from 0 to 30 degrees, and two pitch involute and cylindrical teeth were selected for experiments. The shapes varied from those of pinions to those of racks, and the following conclusions were reached:

1. The plane of fracture is approximately parallel to the line of pressure, and not necessarily at right angles to the radial plane.

2. Corner breaks are likely to occur even when the pressure is uniformly distributed.

3. Rack teeth are about twice as strong as those of pinions of 15 to 20 teeth, and involute teeth are from 40 to 50 per cent. stronger than cycloidal.

The breaking pressure corresponded quite well to those calculated from the modulus of rupture of the iron used. There is reason to believe that teeth in service which have a less strength than indicated by static experiments would have substantially the same relative strength as those indicated.

In testing the arms and rims of pulleys a steel belt was used and a twisting moment thus applied to the pulley through the medium of levers and a testing machine. The pull on the tight side of the belt was graduated to twice that of the slack side, and the pulls were increased until one or more of the arms failed. The arms were slightly tapering and had twice the strength at the hub as at the rim. The fact that they broke sometimes at one end and sometimes at the other showed the ratio of the bending moments. The arm or arms nearest the tight side of the belt nearly always failed first, and we were justified in forming the following conclusions:

1. That on account of the springing

* From an address delivered before the delegates to the Convention of the American Foundry Foremen at Cleveland.

of the rim the bending is unevenly distributed, so that about twice the average moment comes on the arm nearest the tight belt.

2. That the bending moment at the hub is about double that at the arm, as such pulleys are usually designed. The above ratios will be affected by variations in the relative stiffness of rims and arms.

Tests of Rotating Pieces.

The most fascinating and the most spectacular series of experiments have been those in which rotating pieces have been tested to destruction by high speed. As these tests have been carried on for four years, and upward of 40 wheels of various sizes and types have been ruptured it will be impossible at this time to give even a resume.

In carrying on these experiments the wheels to be fractured were guarded by heavy oak plants 12 inches square, and as the fragments frequently split this timber the guards were reinforced with boiler plate. Wheels, models or fly wheels without flanges were operated at a speed up to 400 feet per second, while those made in sections reached the speed of only 150 feet. Placing the joint close to the spoke did not appreciably strengthen the wheel, although steel tie rods between the joints and the hubs increased the strength to some extent. English wheels, built on the bicycle wheel pattern, were the strongest wheels experimented with, giving a speed of 4,000 revolutions per minute. The large number of spokes permitted of no bending of the rim. All of the wheels experimented with were 24 inches in diameter.

A slide was exhibited showing the steel guard plate over a pulley 4 feet in diameter on which the breaking strength was to be ascertained. The outer guard was made of 11-4 inch boiler plate, with 1-2 inch plates on the sides, and protected on the interior with oak timbers. The bursting mechanism was located inside of the shop. A balance weight weighing 3 1-2 lbs. was located inside of the rim, and the wheel burst at 1,200 revolutions per minute. It should have withstood a strain of 2,000 revolutions, and from this experiment the conclusions were reached that no high speed pulley should have a balance weight. An ordinary split pulley which was broken, having a balance weight inside of the rim of 3 1-2 lbs., and whose flange weighed 7 lbs., burst at a speed of 600 revolutions per minute. Views of a broken cast steel fly wheel which reached the speed of 1,700 revolutions per minute were also shown. In the bursting of this wheel some sections were hurled a distance of more than 100 feet. From these tests we reach the following conclusions:

1. Any weight on the rim between the arms of a rapidly rotating wheel, whether it be a flange, a balance weight or otherwise, is a source of weakness and danger.

2. When the weight is accompanied by a joint or any breaking of the metal at such a point the wheel is entirely unsafe at even ordinary belt speeds.

3. Solid rims of cast iron as ordinarily designed are almost entirely free from bending stresses and will not burst at speed much less than 400 feet per second.

In closing, he added that tests on cast iron discs have just been commenced, and so far the difficulties have been found greater than in any other series of experiments. The bursting speed of a disc is from one and a half to two times that of a ring, and this high speed, coupled with the severe shock of bursting, has affected the steam turbine used in making the experiments. So far three 18-inch discs have been burst at a speed of about 7,500 revolutions per minute. This corresponds to a rim speed of about 600 feet per second and to a stress near the centre of about 12,000 lbs. per square inch.

Uses of Electricity in a Modern Factory

By Paul Lincoln.

THE modern factory is usually, perhaps naturally, considered as one of the products of modern civilization and progress. It would be more true to say that modern civilization is a product of the modern factory; analysis will show that this is true. Modern civilization is pre-eminent in the material needs which mankind possesses in these modern times. In former generations every man was his own house builder, his own weaver and spinner, his own brick mason, his own coach builder and harnessmaker, and in fact practically all of the functions which are now carried on by manufacture were then carried on by the individual, each man's manufacture to support his own uses. Since the product of this miniature factory was small the appliances were exceedingly crude and consequently the time required to produce the given amount of material was excessive. Modern arrangements have superseded these. Now one man or one group of men devote their entire time, attention and energies, for instance, to the manufacture of a certain variety of cloth. All the appliances that ingenuity can devise have been provided to enable this group of men to produce the maximum quantity and the best quality of this particular variety of cloth with a minimum expenditure of energy. What is the result? Where one man in former generations could produce only perhaps a few yards of cloth per day, with modern methods the same amount of human labor can produce thousands. Another man instead of weaving cloth spins yarn; another makes wagons and coaches; another harness; and so it goes, each man devotes himself to one specific thing, with the result that the efficiency is increased almost incredibly. By efficiency I mean the net result which can be produced by a certain amount of human labor. Labor is really the only available product that mankind has; no material is of any value unless labor has been performed upon it. Modern civilization is because the efficiency of this element of labor has been increased to a point almost infinitely beyond that which existed in former times; in other words, by modern methods a given amount of labor produces infinitely larger results than in former times. A weaver, therefore, is enabled to expend his labor and energy in the produce of thousands of others who are working on their particular specialty and thus he is enabled to have a total which is almost incredibly beyond the total which our forefathers could possess because the total labor of the present day working at so much higher an efficiency is enabled to produce such vastly increased results over the same labor in former times. I think, therefore, that I can say without fear of contradiction that modern civilization is the result rather than the cause of the modern factory.

Whatever, therefore, increases the efficiency of the modern factory must necessarily make for progress. There is, I believe, no single element that has entered into the increased efficiency of modern methods so much as the use of electricity. Perhaps I should exclude from this generalization the use of the steam engine in all its ramifications. The steam engine is a producer of power

whereas electricity is simply a transmitted power.

There are three classes of men who are responsible for the progress of human knowledge and for the advance of mankind in general. In first of these classes we have the genius who lays down the fundamental laws of science. This class includes, for instance, such men as Sir Isaac Newton, who first enunciated the law of universal gravitation; such men. as Gallileo, Keppler, Copernicus, who laid down the laws governing the heavenly bodies; such men as Carnot, Watt and Rankin, who enunciated the laws of modern thermodynamics. The geniuses in the electrical field come to mind easily because with great wisdom we have named the electrical units from them: Ohms, Ampere, Volta, Galvani, Faraday, Maxwell, Weber, Oersted; all of these men contributed their labors to the electrical science and contributed with such success that their names have been perpetuated by calling after them the units which the electrical engineer has to deal with. These men, too, have labored in the interests of pure science without the hope or expectation for material reward for their labors in this direction.

In the second class of men who are responsible for modern progress are those who, starting with the fundamental laws, have applied them by invention to practical uses. The man who I would name as the first of this class is the one whose name is attached to the concern which I have the honor to represent this evening—Mr. George Westinghouse. His contributions to modern progress have been colossal; they are too well known to enumerate. The number of men in this class is exceedingly large; it embraces such men as Edison, Bell, Howe. Here in Niagara Falls there are some men of world-wide fame who may be included in this class—Hall, the inventor of the process for the production of aluminum, and Atchison, whose work in electric furnaces has placed a new agent in the hands of the world.

The third class that I consider responsible for modern progress is the men who advance the capital necessary to carry on manufacturing activities of modern times. Here again as foremost of his class I would name the same man as before, Mr. George Westinghouse. Westinghouse not only is a creator of ideas, he is as well an investor in ideas and his investments in this class of securities have paid him well. It is this class that probably has been best paid in the material things of the world for their participation in modern progress. A number of instances of such men come to mind readily; Carnegie, who invested in ideas for making steel and has become many times a millionaire; Cyrus W. Field, who invested in the idea of the trans-Atlantic cable; financiers who have invested their capital here in Niagara Falls in the idea of electric power transmission. These are only a few of the examples of this third class who are responsible for the advance of civilization by having sufficient faith to put their money into modern ideas.

All of these classes of men have been particularly active in the field of electricity and instances come to our minds in this field with particular ease because the development in this field has been so rapid. It is only a little over a hundred years since the electric fluid has had a name. It has been considerably less than a hundred years since the first intelligence was transmitted by electricity. It is only within the last twenty-five years, however, that rapid progress has really begun in this line. It is only within that time that the art of lighting by electricity and the art of generating it for mechanical power has been perfected.

Electricity has become an agent for the advancement of civilization in two ways; first, it has produced methods of doing things which were done by other means formerly, but doing them in a much quicker and more efficient manner. For instance, formerly the power of a steam engine was transmitted to the lathe by means of belts and shafting, which means were both expensive and inefficient, cumbersome and dangerous. Go into the modern factory and you see no belts or shafting with its continual wear and nerve-racking hum. In its place you will see a few innocent wires which carry the electricity from the generating point, situated to suit convenience, directly to the piece of apparatus that it is wished to operate. As for lighting, it has done away with the expensive and dangerous oil and gas and has substituted a brilliant, easily controlled, inexpensive source of light. Many other instances could be named in which electricity, although it has accomplished nothing new, has enabled us to accomplish those things with much greater efficiency.

Second, electricity produces things which without it would be absolutely impossible. The whole art of electroplating, for instance, depends absolutely upon its use. The art of dissociation of compounds by the electric current and their recombing into other compounds is due to its use. For instance, the process of aluminum production which is carried on so extensively here in this city. The process of decomposition of salt and recombing its elements into other compounds is due absolutely to its use. The electric furnace is but another tool which, used by such men as Atchison and others who are familiar to you, has become an agent to produce results absolutely unattainable by other means and will become no man knows how useful an agent.

LARGE INCREASE IN IRON PRODUCTION.

THE production of all kinds of steel ingots and castings in Canada in 1905 exceeded the record of 1902 by 221,412 tons. As compared with 1904, the increase amounted to 254,665 tons, or over 171 per cent. Bessemer and open-hearth steel ingots and castings were made in 1904 and 1905, the production of open-hearth steel amounting in the latter year to over 59 per cent. of the total.

The following table gives the production of all kinds of steel ingots and castings in Canada from 1894 to 1905, in gross tons:

Years.	Gross tons.
1894	25,685
1895	17,000
1896	16,000
1897	18,000
1898	21,540
1899	22,000
1900	23,577
1901	26,084
1902	182,037
1903	181,514
1904	148,784
1905	403,449

The production of all kinds of finished rolled iron and steel in Canada in 1905 was also much greater than in any previous year, and amounted to 385,826 tons, as compared with 180,038 tons in 1904, the year of next largest production, an increase of 205,788 tons.

The following table gives the production of all kinds of iron and steel rolled into finished forms in Canada from 1895 to 1905, in gross tons:

Years.	Gross tons.
1895	66,402
1896	75,043
1897	77,021
1898	90,303
1899	110,624
1900	100,690
1901	112,007
1902	161,485
1903	129,516
1904	180,038
1905	385,826

The production of Bessemer and open-hearth steel rails in 1905 amounted to 178,885 gross tons, against 36,216 tons in 1904; structural shapes, 885 tons, against 447 tons in 1904.

The total quantity of all kinds of iron and steel rolled into finished forms in Canada in 1905, including forging blooms and forging billets, amounted to 385,826 tons, against 180,038 tons in 1904. Of the 385,826 tons of finished iron and steel reported for 1905, about 318,495 tons were rolled from steel and 67,421 tons from iron, as compared with 126,850 tons rolled from steel and 52,188 tons from iron in 1904.

Practical Mechanics

BY W. H. RAEBURN

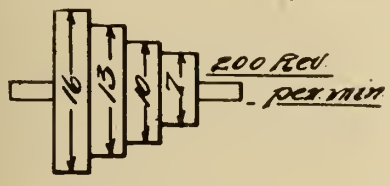
Article VI. A descriptive discussion of an important subject, simply and clearly stated. Every article of this series should be read and studied by all readers of Canadian Machinery. They are practical and helpful.

GEARING.

WE have discussed a few simple problems in gearing, and the number could easily be increased with profit to the student, although the same principles run through all cases, and when these principles are understood there is little difficulty in applying them.

Lathe Pulleys and Gears.

A very interesting study in speeds obtained by a combination of pulleys and



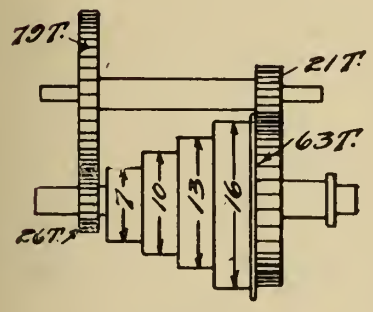


Fig. 1

gears is found in a cone-driven lathe, and we shall now briefly consider such a drive—that for an ordinary 24 in. lathe. In Fig. 1 we have represented in outline the driving parts—gears and cone pulleys—the cone pulley on the countershaft being of the same dimensions as that on the lathe spindle.

We shall start with the assumption that the countershaft makes 200 rev. per minute, and find the four different speeds at which the spindle cone pulley can be run. The fastest is $200 \times \frac{16}{7} = 457.14$; the next $200 \times \frac{13}{10} = 260$; next $200 \times \frac{10}{13} = 153.84$, and the slowest $200 \times \frac{7}{16} = 87.5$. When the back gears are thrown out and the cone lock used to lock the cone to the spindle gear, the above speeds represent the speeds of the spindle, but when the back gears are in and the cone lock disengaged the spindle speeds are much slower than those of the cone, the reduction depending on the back gear ratio.

The term back gear ratio in another form means the number of turns the cone has to make to cause the spindle to revolve once. This it will be seen depends on the proportions existing between the number of teeth in the gears and pinions forming the drive.

If the pinion which is secured to the cone had only a third of the number of teeth that the gear with which it engages has, that gear and the pinion attached to the quill on which it is secured would revolve 1-3 rev. to one of the cone; then if the spindle gear had three times as many teeth as its driving pinion the spindle would revolve 1-3 rev. to one of the back gear quill, so that while the cone made one rev. the spindle would make $\frac{1}{3} \times \frac{1}{3} = \frac{1}{9}$ rev., or the cone would have to make 9

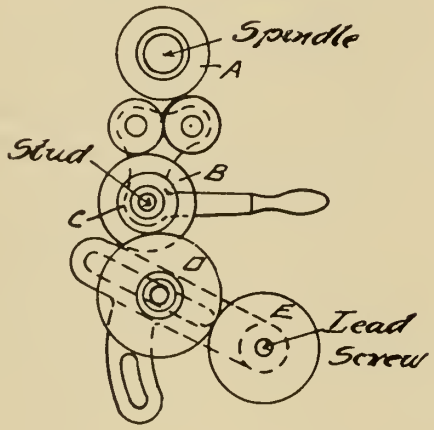

Fig. 2

rev. to revolve this spindle once, and we would say the back gear ratio was 9. We have taken this supposed case for ease of illustration, but it is not always possible to have the back gear ratio represented by a whole number, since the two pairs of gears must run at the same centre distances, and the pitch of the teeth is nearly always greater in the spindle gear and its pinion than in the others. Later on, when we take up the subject of gear teeth, we shall illustrate this part more clearly. In the case before us the back gear ratio is $\frac{79}{26} \times \frac{63}{21} = 9.115$. Now if we divide each of the cone speeds found above by 9.115, we shall have the spindle speeds obtainable with back gears in $\frac{457.14}{9.115} = 50.1$; $\frac{260}{9.115} = 28.52$; $\frac{153.84}{9.115} = 16.87$, and $\frac{87.5}{9.115} = 9.59$.

The spindle speeds then are: 457.14 — 260—153.84—87.5—50.1—28.52 — 16.87—9.59.

Now these speeds do not increase by equal amounts, but are arranged approximately in what is termed geometrical progression, that is to say, each speed other than the slowest is equal to one next below it multiplied by a constant quantity, at least nearly enough constant to serve practical purposes.

A very desirable feature in deciding on back gear ratio is to have the change of speed obtained by throwing in the back gears and shifting the belt from the largest to the smallest step of the cone correspond to a change obtained by shifting the belt from one step to the next. This preserves the progression unbroken. In the case before us the change is made between the speeds of 87.5 and 50.1, and there is practically the same relation between these two speeds as between any other two adjacent speeds on the list. The relation is expressed by the quantity obtained by dividing the greater by the

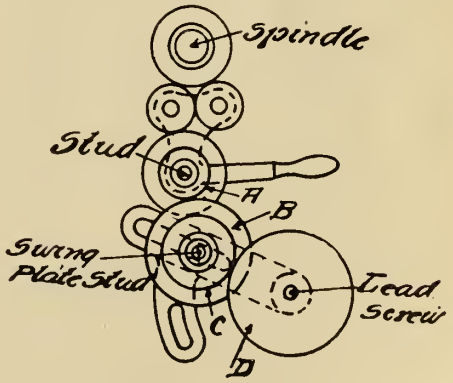

Fig 3

less, and here that is approximately 1.75, which is termed the ratio of progression. Perhaps the man at the lathe is more interested in the arrangement of gearing for cutting screws than in the driving gears, and although the tendency to-day is towards automatic, or at least semi-automatic, devices, yet the machinist should not drop his inter-

est in the how and why of this matter of screw-cutting gearing.

Many are thoroughly familiar with the subject, but this article is not for them. We hope to reach a few who shrink from a problem in this line because of frequent use of algebraic expressions. While these are great aids, it is not impossible to work without them.

Simple Gearing.

The numerous quick gear change devices that are in use to-day alter the appearance of the old-time lathe, but the same elements as ever are there, although in different form, so that we are quite safe in taking the older and perhaps best known form of gearing arrangement as an illustration. In Fig. 2 is shown a common arrangement of change gearing of a lathe, this being what is known as simple gearing. The tumbler gears for reversing are familiar to all having had anything to do with lathes. From what we learned from the last article, gear (A) on spindle and (B) on stud will run in unison with each other if they are made with the same number of teeth. Gear (C) on the stud and (E) on the lead screw can be changed to suit requirements, and it is with the finding of the proper number of teeth in these two gears that we are now concerned.

It is clear that if (C) and (E) are equal, (D) being an intermediate or idler does not enter into the problem, the gear on the stud, therefore the gear on the spindle and the spindle itself will make the same number of revolutions in a given time as the gear on the lead screw and therefore the lead screw itself.

Thus a threading tool would cut on a shaft a thread of exactly the same pitch as that of the lead screw. Let us change gear (C), making it one with only half the number of teeth in (E). The spindle will then have to make twice as many revolutions as the lead screw in a given time, and the pitch of the screw cut will be one-half that of the lead screw.

Any other ratio of gears would show similar results, so that we have the simple rule that the number of threads per inch cut is in the same proportion to the number of threads per inch in the lead screw as the number of teeth in the lead screw gear is to the number of teeth in the stud gear. Take a practical example: Let it be required to cut 7 threads per inch, the lead screw having 4 threads per inch. The number of teeth in the gear on the stud must be 4-7 of the number of teeth in the gear on the screw, and any two numbers bearing this relation to each other will be suitable, but, of course, our supply of gears is limited, so we select what we think will be a suitable gear for the stud, say 20 teeth. 20 is 5 times 4, so that if we take 5 times 7 = 35 we have 20 and 35 as the two gears required. A suitable intermediate (D) must be used to reach from one to the other. To put one rule in another form, we have this: Write a fraction whose numerator is the number of threads per inch in the lead screw and denominator the number of threads to be cut, then multiply these two figures by any one figure until the two numbers obtained represent gears that can be found in the set and used in conjunction with a suitable idler. The above rule will always work on simple geared lathes.

One more example: Lead screw 5 threads per inch; work 11½ threads per inch (pipe thread).

$\frac{5}{11.5}$ multiply each by 4 and we have $\frac{20}{46}$ the gears required, but we may not have a 46-tooth gear. Doubling both numbers, we have 40 and 92, but the latter may not be in the set, so we try multiplying $\frac{5}{11.5}$ by 10 and we have $\frac{50}{115}$ representing two gears we can probably obtain.

Compound Gearing.

Considering now the compound geared lathe, in it instead of a single idle gear being used on the swing plate, there are two gears—keyed to each other—the one engaging with the gear on the stud and the other with the gear on the lead screw, as shown in Fig. 3.

We have thus two points at which to vary the speed ratio, and it is possible to accomplish a desired result by several different combinations. Let it be required to cut a screw with 2½ threads per inch in a compound geared lathe and the lead screw having 4 threads per inch. According to the rule for simple gearing $\frac{4}{2.5}$ represents the ratios between the gears, and 40 and 25 tooth gears could be used in simple gear. This is a case of speeding up the lead screw, the ratio of increase of speed being 40 to 25. Although the increase is small we shall try to divide it between the two pairs of gears in the train. Choosing 50 and 40 for the first pair of gears, (A) and (B) $\frac{50}{40}$ will be the ratio of increase obtained by means of these. But we must have $\frac{4}{2.5}$ or $\frac{40}{25}$ as a total ratio of increase to enable us to cut the desired thread, so that we must find another fraction which, multiplied by the former will produce $\frac{40}{25}$. Divide the latter by the former to get this fraction $\frac{40}{25} \div \frac{50}{40} = \frac{40}{25} \times \frac{40}{50} = \frac{32}{25}$. Thus gears (B) and (D) should have 32 and 25 teeth, respectively, but 64 and 50 teeth would probably work in better. Proving our work we have $\frac{50}{40} \times \frac{64}{50} = \frac{8}{5} = \frac{4}{2.5}$, the fraction we commenced with.

We shall conclude with another example: Lead screw 2 per inch, thread to be cut 14 per in. Here we have the total speed ratio $\frac{2}{14}$ to be divided into two reductions $\frac{2}{14} = \frac{20}{140} = \frac{5 \times 4}{14 \times 10}$, so that any two pairs of gears whose numbers of teeth give the fractions $\frac{5}{14}$ and $\frac{4}{10}$ will suit. Multiplying all numbers in these fractions by 5 we have 25 and 70 for (A) and (B), and 20 and 50 for (C) and (D).

LARGE ORDERS.

THE Canadian Westinghouse Co. have secured several important contracts recently, among which the more interesting are as follows: One for supplying the Provincial Light, Heat & Power Company with apparatus to be used in the development of another large water power plant near Montreal. The initial installation will consist of three 3,750 k.w., revolving field, alternating current, water wheel driven generators of 4,000 volts, three phase, 7,200 alternations; also twelve 2,500 k.w., 4,400 volts, oil insulated, water cooled transformers. This new power station will be used for supplying additional power to the Montreal Light, Heat & Power Company at Montreal. The step-up transformers will be wound for 4,000 to 44,000 volts, and the lowering from sion line is about 40 miles in length. Another is for the Northern Electric & Mfg. Company, of Montreal, for a 300 k.w., Westinghouse-Parsons turbo generator unit, to be installed alongside of one of the same capacity now in service. The generator is a 220 volt, three phase, 7,200 alternation machine, operating at 3,600 r.p.m., and will be of the latest enclosed type, while the turbine will operate at 150 pounds steam pressdre with 100 degrees superheat. Their present turbine is operating part of the year condensing and through the Winter non-condensing, the exhaust steam being used during the Winter for heating purposes. It was the splendid operation of this steam turbine generating unit which led the company to order the one about to be installed.

Mechanical Reviews

OPINIONS AND STUDIES WORTH NOTING

SOME PUMP AND ENGINE IMPROVEMENTS.

FIGURE 1 represents a combined air and circulating pump on which we made an improvement in the cross-head. As originally designed, the steam and water pistons were connected by a continuous rod and the crosshead was slipped over this rod and held in place by a set-screw. This crosshead would slip on the rod sometimes, but if you wanted to take it off, a 10-pound sledge hammer would not persuade it to slip. The half of the rod between the cross-head and the water piston had to be renewed every once in a while, as the circulating end of the pump gets more or less sand. The cylinder heads (D) and (E) are cast solid with the frame of the pump, so they cannot be removed, and in order to renew the crosshead or the

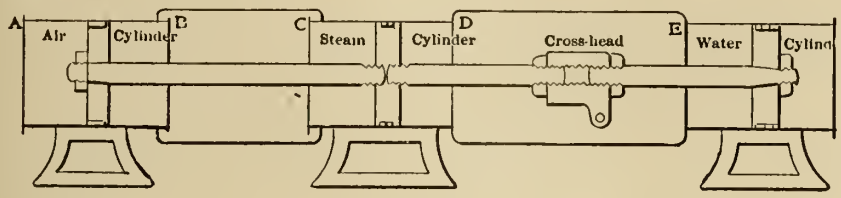

Fig. I.

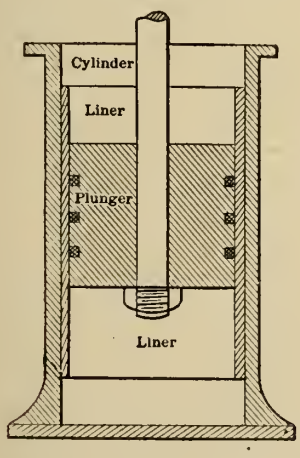

Fig. II.

rod it was necessary to take off the heads (A) and (B), then remove the water piston and slide the air and steam pistons out of their cylinders, loosen the lock-nut on the water piston rod and then unscrew the rod out of the steam piston. By substituting the cross-head here shown for the old one and cutting the rod in two all this trouble was eliminated. The rods being screwed in and held by lock-nuts, there is no chance for the crosshead to slip, and each rod is independent of its neighbor. There is quite a saving of brass also in a year's run, as the steam rod can be made of steel. Care should be taken that the nuts do not strike the glands, which will occur if the crosshead is made too long.

Fig. 2 shows an improvement that was made to a vertical duplex pump. The sketch shows a cross-section of the cylinder of the water end, its brass liner and brass plunger. In this type of pump the builders intend the solid brass plunger to run unpacked in the brass liner. That is all right as long as there is no wear, but I have yet to see one that does not wear. Of course they can be renewed, but brass is no cheaper in this part of the country than elsewhere; so we hit upon the following scheme to cut this expense down:

Grooves similar to the packing-ring grooves of a piston are turned in the plunger 5-8 inch wide and a little less than 5-8 inch deep, depending on how much the plunger is worn. We insert 5-8 inch hydraulic packing in these grooves, put the plunger in the cylinder and connect the rods together, and we know the pump will work at its rated capacity for three months.

If the reader is thinking of fixing a pump up like this, however, he must not get too industrious and try to cover the whole length of the plunger with grooves. We tried that and at the first stroke the pump made the lower end of the plunger went below the end of the liner, as the builders intended it should, and the end rings of packing came about half way out, and when the plunger started up it went about an inch and stopped. It took three jack-screws to get the plunger out and after that we put packing around the central part of the plunger only.

Fig. 3 shows how a broken bonnet was repaired. The collar on the end of the dash-pot plunger had a habit of working off, and this of course makes the dash-pot rod too long. It is possible to braze some small bonnets, but on the larger ones it does not seem to work. These bonnets usually break at the point marked (X), and generally do no other damage, although once in a while a stem will be bent. The bonnet was bored out and the sleeve was made and pressed in. The end of the sleeve was threaded and the round nut (N) was screwed on by means of a punch, and the holes drilled in the circumference of the nut. A collar (C) was shrunk on the end of bonnet

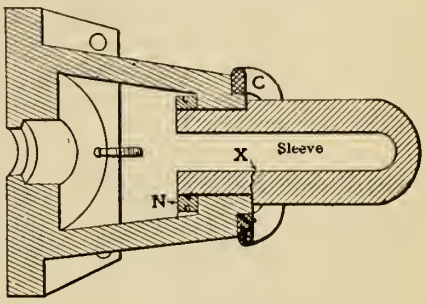

Fig. III.

to keep it from splitting when the sleeve was pressed in.

Fig. 4 shows how we ended our dash-pot troubles. The collar (K) would work off the plunger and make dash-pot rod too long. The screw (B) was supposed to hold a small threaded section tight enough to keep the collar from turning, but it did not do so. A hole was drilled through the collar at (A) and about 3-4 inch into the plunger at (D).

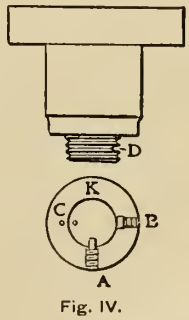

Fig. IV.

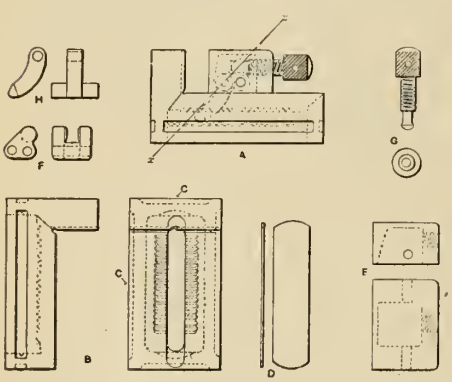
The holes in the collar are tapped out, the larger ones for 5-8 inch and the smaller for 1-2 inch screws. We used steel screws with the ends turned off to enter the hole (D). The other end is slotted for a screw-driver. The bottom of the plunger and the collar are marked with a centre punch, as at (C), so as to show when the holes are in alignment.

The set-screw (A) cannot get out because the collar is surrounded by the wall of the dash-pot. It is also certain that the collar will not turn with 3-4 inch of screw in the hole (D). This collar has only one position on the plunger, so that if one leather is not as thick as the one we had on when the hole (D) was drilled, we make up the difference with a piece of thick paper.—"Practical," in Power.

TOOLMAKER'S VISE.

IN the shop where I was employed some months ago there were about 75 toolmakers and every one seemed to have better ideas than the other, paradoxical as it may seem. This simply means that they had different views. One day one of them showed the other a design of toolmaker's vise. It was well demonstrated and every one seemed to like it very much, but when he made it they one and all had something to say against it. The principal objection seemed to be that the hook screw extended



Tool Maker's Vice.

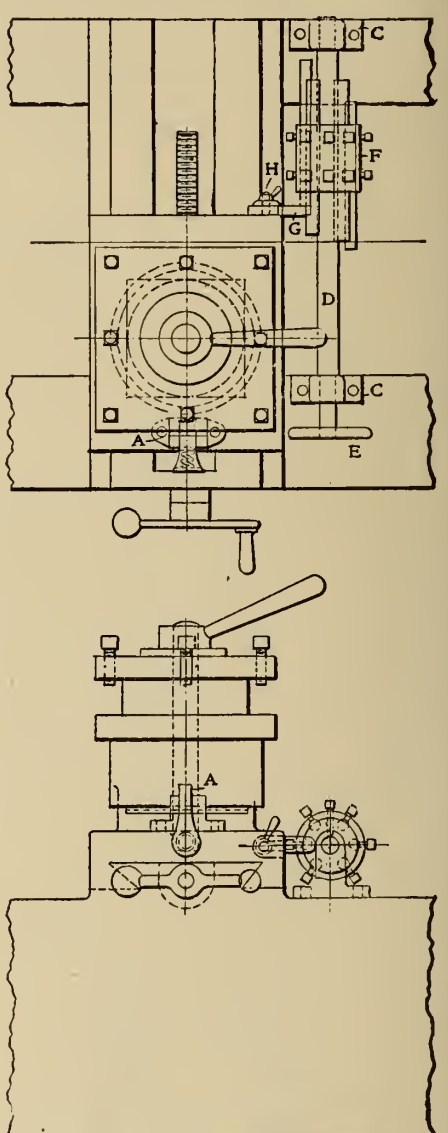
above the top of the rear jaw so that when using it for grinding or planing lengthwise the nut was in the way. Another vise was immediately made by another toolmaker, using the same design but with the hook screw shortened and the nut countersunk into the rear jaw at an angle of about 45 degrees. With this a cup-wrench was required to tighten the nut. At the same time still another vise was made of an entirely different design of tightener in the rear jaw which when compared with the other proved to hold the work much more tightly when screwed up with about the same power. It is a common saying that it takes a good man to design a creditable job, but any fool can criticize, and I must confess that I am one who is guilty in that respect.

But having found this tool very simple and convenient in its construction, I thought it worth while to illustrate it in Machinery, for we all know how difficult it is at times to handle small pieces of work; it is often necessary to solder them into a plate in order to do accurate work. The vise is made square and parallel on all sides and is 2 13-16 inches long, 1 1-2 inch wide and 1 1-2 inch high. The sketch at (A) shows the vise assembled, and surrounding it are the parts. (B) is the body made of tool steel and pack-hardened, ground and lapped square all over; it is milled out inside and 19 ratchet teeth are cut with an end mill at an angle of 30 degrees. In the centre is a slot with round ends in which the hook (H) can move freely. A V-groove of 45 degrees angle is cut in the face of the stationary jaw square with the base so as to hold small round pieces vertical. On each end inside is cut a narrow slot 1-16 inch deep to fit the thin spring plate (D), which is inserted to prevent the hook dropping down. The movable jaw (E) is also made of tool steel and pack-hardened, ground and lapped over. A recess is cut in the under side of the sliding jaw with a round cornered end-mill, and a pin-hole is drilled transversely through the jaw for the pin to hold lever (F); at the back a 5-16 inch hole is drilled and tapped for screw (G). The hook (H) is made of tool steel hardened in oil and drawn to a straw color. It is made T-shaped, the body being slightly less than 1-4 inch thick so as to work freely in the slot in the base, and a pin-hole is drilled at the upper end through which a pin is fitted to join it to the lever (F). Lever (F) is made of tool steel pack-hardened while screw (G) is spring tempered; the screw is made 20 pitch left-hand so that when turned to the right it will tighten the jaw. The line x—x through the point of the hook and the centres of the lever (F) when in line should make an angle of about 45 degrees so that when the screw is tightened the jaw will be drawn down against the base with about the same resultant pressure as is applied against the stationary jaw.—O. Westberg, in Machinery, N.Y.

A LATHE TRANSFORMED INTO A TURRET MACHINE.

THE only turret lathe in the shop was so crowded with work that two ordinary lathes had to be run on the same job. The production of the lathes was disappointing, and served to prove the usefulness of the special machine. Buying a new turret lathe was out of the question, for the rush was only temporary, and it was thought of transforming one of the lathes into a turret machine, which was done at a light expense, as shown in the sketches.

The compound slide was removed and a fitting turned for the turret, whose simple construction is clearly shown in the sketch, which also shows at (A) a combination of a bracket, latch and spring to lock the turret at four different positions. The turret stop consists of two brackets (C C), bolted on the carriage; a shaft (D), hand-wheel (E) and muff (F) that has six rods of convenient lengths. On the cross-slide is a strap (G) with a long slot. Bolt (H) is square at the base to fit the slot of the strap, and has a nut with a handle. To



A Lathe Transformed into a Turret Machine.

turn muff (F) the strap is brought back to be pushed forward and fastened when the muff is in the right position. In this way the production of the machine was doubled.—J. M. Menegus, in American Machinist.

The Kilkeel Co., Limited, Toronto; capital, $20,000; purpose, to build and operate steam vessels. Directors are: A. W. Mackenzie, D. B. Hanna, L. W. Mitchell, G. G. Ruel, G. F. Macdonnell, all of Toronto.

Tricks of the Trade.

Everybody is invited to contribute to this page. Send in your ideas, odd jobs you are doing, and anything of interest to fellow-workmen. Remuneration will be made for such contributions. [Ed.]

CHANGE OF SPEED.

THE accompanying figure will give a suggestion of a simple speed change device, where small amounts of power are transmitted. (A) and (B) are two cast iron or steel discs keyed to shafts, and (C) is a disc of rawhide, or similar material, which can be moved up and down between the limits of the upper edge of disc (A) and the lower edge of disc (B). Disc (A) in revolving transmits motion to (C) and (C) transmits it to (B), there being, of course, some device for producing a pressure between (A) and (B) of sufficient magnitude so that (C) will transmit the motion. This might be done with a spring attached so as to pull (A) against (C), (B) being fixed, the pull of the spring required depending upon the amount of power transmitted. The relative speed of (A) and (B) will depend upon the position of (C); the higher up (C) is the greater will be the speed of (B) with regard to (A), and the lower (C) is, the less will be the speed of (B) with regard to (A).

The strength of the spring required may be found in the following manner:

From the horsepower transmitted and the speed of the shaft, the torque can be found from this formula:

$$T = \frac{33000}{2\pi} \times \frac{H.P.}{N}, \text{ where}$$

T=torque in ft. pds.

H.P.=horse power transmitted, and N=revolutions of driving shaft per min.

Thus from the speed of the driving disc and from the amount of power transmitted, the torque on the driving shaft can be found. Now, the pressure between the driving surfaces must be great enough so that the frictional force, when the disc (C) is in any position, will produce a torque that will transmit the required power from the driving to the driven shaft at the required speed. Now torque is the force multiplied by the distance from the centre of rotation. For a constant torque this force will be greatest when its point of application is nearest the centre of rotation. That is, this force in the driving disc will be greatest when the speed of the driven shaft is least, since then will disc (C) be nearest the centre of disc (A), the driving disc. The distance of the middle line of disc (C) from the centre of disc (A), when (B) is revolving at the lowest required speed, can be found experimentally easier than by calculation, although it can be found in either way. Then

$$P = \frac{T}{r} \text{ where}$$

P=force in pds.

T=torque in ft. pds.

and r=distance of centre line of C from centre of A in ft.

Then $T = Pr = u\,Q\,r$, where

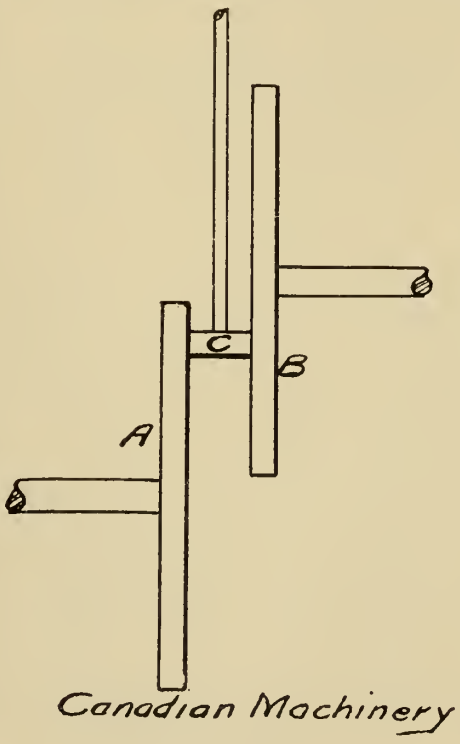
Q=pressure in pds. required between the driveway surfaces, and

u=coefficient of friction.

Then $Q = \frac{T}{u\,r}$

and Q represents the strength of pull of spring in pds. required.

It may be noted that $\pi = 3.14$, and the co-efficient of friction from rawhide on iron or steel is 0.56 if the metals are kept dry.



Speed Change Device.

Hamilton. W. K. Mc.

THEORY AND PRACTICE.

MANY and varied are the opinions held concerning the relative importance of theory and practice. For the most part college men recognize the value of stern practice, if not during their college course, after they get out into actual work. But the purely practical man—the graduate of the workshop only—is oftentimes slow to acknowledge the value of theory. I have heard discussions on this topic which were simply ludicrous because of the one-sided ideas set forth and the absurdly unjust assertions made. In my way of thinking, it is unnatural to regard theory as a thing apart from practice. To give the best results theory and practice must go hand in hand, since upon theory depends practice and upon practice, theory. Without theory practice would not be what it is to-day, and but for practice theory would indeed be narrow and limited. Wherein the design and construction of a machine hinges on theory must be plain to all, and its dependence upon a minute knowledge of practice is only too apparent to any concerned in this work. But there are some men, with little or no theoretical training, who get on wonderfully well. I know of a man, a veritable genius around machinery, with no theoretical knowledge and in fact only a common school education, who has originated not a few machines that are in successful operation in Canadian shops. And how does he do it? It would seem as if it were by instinct; and if that is so the instinct must have come to him as a result of his absorbing interest in machinery from the time he carried tools as an apprentice until now he is an old man. No such thing as strength calculations for him! He just thinks what would be a good size and then it is made. But he is no doubt working in the dark. It cannot be otherwise. Instinct is good, but instinct is very far from being infallible. In my wanderings here and there it has been impressed upon me that the successful man is the man who has neglected neither theory nor practice. He has not necessarily gotten his theory at a college—there are divers ways of getting a theoretical training—but he has obtained it in some way, the more difficult the way oftentimes the more use is made of it eventually. But there are exceptions.

Other readers of Canadian Machinery may have different views along this line and I would be pleased to see them expressed in these columns.

Toronto. J. C. A.

ENGINE EFFICIENCIES.

WHEN engine performances are under discussion, and "experts" are in the act of twisting the "plain mechanics" all up with percentages of efficiency, and pounds of steam per indicated horsepower, here is a little sum that will prove a hot shot to the man who quotes figures without thinking for himself:

By Joule's experiments we know that one B.T.U. (British thermal unit) represents 772 foot pounds of work, or vice versa, 772 foot pounds of work will raise 1 pound of water 1 degree F. By averaging repeated measurements of the heating power of fuels we know that ordinary steam coal contains about 12,000 B.T.U.; that very good steam coal contains about 15,000 B.T.U., and that petroleum oil contains about 20,000 B.T.U. Then multiplying the heat units by the equivalent in foot pounds (772), and dividing the product by the number of foot pounds in a horsepower per min. (33,000), we will get the potential horsepower of a pound of fuel, as follows:

Good steam coal of 12,000 B.T.U. = potential of 280.72 H.P. per min.=4.68 H.P. per hour per lb.

Best steam coal of 15,000 B.T.U. = potential of 350.99 H.P. per min.=5.85 H.P. per hour per lb.

Oil fuel of 20,000 B.T.U. = potential of 467.9 H.P. per min. = 7.79 H.P. per hour per lb.

The best performance to date is very nearly 1 pound of best coal per I.H.P. and a little better than 1 pound of oil fuel per B.H.P., or thereabout.

That would show the energy turned into useful work to be but a fraction of 1 per cent. of the energy known to exist in fuel. This is so very far from the percentages usually quoted—about 28 per cent. for best steam practice—that a word of explanation will not be out of place to even a few professional readers.

Steam engines of good design, well made and well looked after, will have a mechanical efficiency of as high as 92 or 93 per cent.: viz., of 100 per cent. of power delivered to the piston-head 92 or 93 per cent. can be got off the crank shaft; the difference goes in friction, heating of oil and bearings, motion of valve rods, governor, etc., and the increment of wear and tear.

Of the heat delivered to the engine in the steam, a certain portion does useful work during expansion, a portion disappears unaccounted for, and a portion is rejected, in the exhaust, in radiation, clearance, valve leakage, and other losses. Now, in accordance with the pressure and temperature drop during a working stroke, there is a certain proportion of the heat considered available, and there is a certain portion of the so-called entropy diagram that is considered to be unavailable, and this theory gives rise to the measure of a theoretically ideal engine working on the Carnot cycle, the Rankin, or Clausius cycle, against which the actual engine, under nearly similar circumstances, is measured, and that is where they get the commonly quoted 28 per cent. or 30 per cent.—not, be it noted, of the actual energy available in coal or oil fuel, but a portion of the heat available in steam, a standard set up for comparison only.

But before the steam got to the working point there were good big losses in the piping, in the boiler, in the furnaces and up the chimney. We can see many ways of escape. When, however, we note the few hundred odd horsepower slipping through the petrol engine for the insignificant one we capture and partly utilize, the engineer cannot help feeling humbled by the contemplation, and naturally turns for refuge to a Carnot cycle, or some other device, to improve his position before the consumer. That is how it stands.

Montreal. C. J. Stuart.

Practical Questions and Answers

Tapers and Taper-Turning.

Ques.—Will you explain clearly how tapers are designated—there is often confusion and difference of opinion concerning this—and show how tapers are turned by offsetting the tailstock, and explain the principle of the taper-turning attachment on lathes?

Ans.—When tapers are given in amount per unit of length, as inches per foot, the difference in the diameter at the two ends is always meant. That is, if a bar 5 feet in length has a taper of 1 inch per foot, the difference between the diameter of the two ends is 5 inches. But in designating tapers by the angle there does not seem to be a general standard method, and to avoid confusion it should be stated whether the taper angle is between the two sides or between the centre line and one of the sides. The simpler method of denoting tapers, except those that can be turned only by means of a compound rest such as the taper required on a reamer used to ream a valve seat to a certain angle, is by the amount in inches per foot of length. If the taper is given as an angle it cannot be turned in the ordinary lathe between centres or by means of the taper-turning attachment until the taper angle has been converted into inches per foot of length.

The turning of a taper in an ordinary lathe between centres by moving the tailstock over is simple, but a perfectly accurate taper is not obtained, as will be shown. Figure I shows this method of turning a taper. The piece of work to be tapered is placed between centres and the tailstock moved forward across the lathe bed a distance equal to half the amount of the taper in the whole length of the work. Thus if the work is 3 feet long, a taper of 1 inch per foot of length is required, then the total taper will be 3 inches and the tailstock will be moved forward 1½ inches. The tailstock is moved forward half the total taper because the tool moves along a line parallel with the centre line of the lathe, and it is thus obvious that if the tailstock is moved out of line 1½ inches a taper of 1½ inches measured to the centre of the work will be given, which is the same as a 3-inch taper, measuring the difference of diameters, which is what is required.

If the work is of reasonable length and the taper not too great, this is a fairly accurate and quite satisfactory method of cutting tapers. But when the work is short and the taper relatively large the inaccuracies of the method become very apparent, and in cases of this kind the method is not satisfactory. These inaccuracies will be apparent in figure II When the tailstock is moved forward 1½ inches, as in the example quoted, a taper of 3 inches is given to the length of work between centres; but the length between centres is not 3 feet, the length of the work, but is less than that by the distance the live and dead centres project into the work. Thus instead of getting a taper of 3 inches in a length of 3 feet, the taper of 3 inches is in the shorter length. The taper is, therefore, not correct, but when long work and small tapers are being dealt with this practically makes no difference. However, from figure II it can be seen that in short work this would throw the taper out considerably. Thus instead of

there being a taper of the required amount in a length "l," it is in the length "l," the distance between centres. An example will show this plainly. A piece of work 6 inches in length is required to be $2\frac{1}{2}$ inches in diameter at one end and 1 inch in diameter at the other; that is, a taper of 3 inches to the foot is required. The work will be

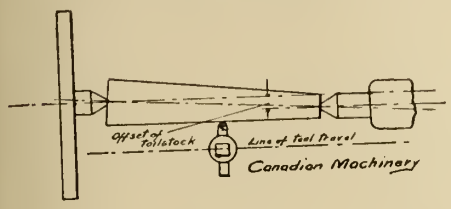


Fig. I.

ent off the required length, i.e., 6 inches, and will be placed between centres, the tailstock being moved forward half the amount of the required taper, i.e., $\frac{3}{4}$-in. Suppose that the centres extend into the work 3-16 inch at each end; then instead of getting a taper of $1\frac{1}{2}$ inches in 6 inches it will be in $5\frac{5}{8}$ inches, giving a taper of 3.2 inches per foot of length. This would mean that in a length of 6 inches there would be a taper of 1.6 inches, and if the small end were tapered to a diameter of 1 inch as required, the large end would be 2.6 inches in diameter instead of 2.5 as required, making the large diameter 1-10 inch too large.

In a case like this the taper can be turned only by moving the tailstock over by degrees and calipering the work until the correct taper is obtained, which is tedious and not always satisfactory.

By referring to figure II, another difficulty in the way of producing an accurate taper when the work is short and the taper large will be apparent; that is the impossibility of properly centreing the work and keeping it steady between centres. The points of the centres instead of being free will bear on the sides of the holes made by the centreing tool,

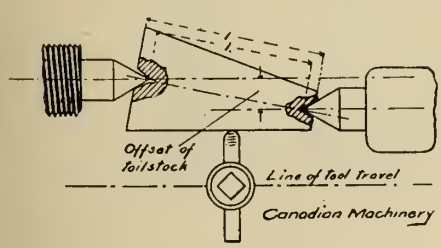

Fig. II.

and thus it cannot be assured that a smooth, even taper will result.

In figure III is shown the principle upon which all taper-turning attachments operate. With this arrangement there is neither of the foregoing difficulties to be met with. The two centres are always in line, and the taper being laid off on the adjustment bar, there is no difficulty with short work. The distance between the adjustment bar supports is fixed, and the amount of taper required for this length being laid off by the adjustment bar, as the carriage moves up the tool follows the slant of the bar producing the correct taper in the work.

Gas Turbine.

Ques.—Will you tell me whether there have been any gas turbines patented or placed upon the market in Canada or the States; and if not, will you give me the chief reasons that the turbine principle has not been taken advantage of with gas as it has with steam?

J. H. P.

Ans.—So far no gas turbine has been placed upon the market either in Canada or the United States, or if there has been, the fact is not widely known. There have, however, been gas turbines patented, and experiments are now being made with them, but in spite of this the prospects for the production of an efficient gas turbine in the near future are not very bright, because the highest authorities on gas and gas engines are not at all optimistic. The three big obstacles in the path of the gas turbine

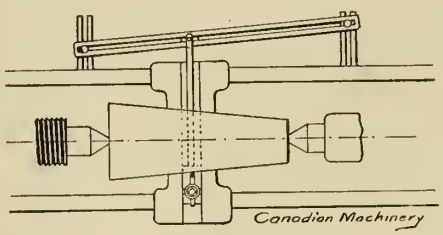

Fig. III.

are: The high temperatures necessary to economy, temperatures so high that no known constructive material can long withstand their action; the high peripheral velocity necessary to the economical use of gas in a turbine, which velocity results in too great a centrifugal force for materials to stand; and the difficulty of compressing the gases to a sufficiently high pressure in a turbine.

It is claimed that these difficulties can be overcome by combining a reciproeating with a rotary movement, the turbine part of the combination being put to the same use as the low pressure cylinder in a double expansion steam engine. The mechanism is as follows: A pair of opposed cylinders have their crank-shafts geared to the shaft of the turbine; these cylinders are operated upon the Otto cycle, the exhaust being forced into the turbine, first mingling with steam from a boiler of the automobile type. The gases in mingling with the steam are lowered in temperature, while keeping almost the same kinetic energy, and since the kinetic energy remains the same and since the mass is increased, the velocity is decreased. The cylinders are water-jacketed, the heated water going to the boiler. From this it would appear that all three difficulties are overcome; but so far no proof has been given that this is commercially feasible.

Weight on Safety Valve.

Ques.—What is the rule to find the weight necessary to put on a safety valve lever when the area of valve, pressure, etc., are known?

Ans.—A rule covering this case is as follows: Multiply the area of the valve by the pressure in pounds per square inch; multiply this product by the distance in inches of the valve from the fulcrum; multiply the weight of the lever, in pounds, by one-half its length; then multiply the weight of valve and stem by this distance from the fulcrum, add these last two products together, subtract their sum from the first product and divide the remainder by the length of the lever; the quotient will be the weight required.

RE-CUTTING STRIPPED NUT AT SEA.

I read the article on above in May issue of Canadian Machinery. It is not an unusual occurrence for square threads to give out at sea. I myself have compressed a larger nut to fit the intermediate stop valve spindle, and that without stopping the engine. The nut was square threaded and same pitch. I have also taken the spindle nut off the injection valve screw and put a 1-inch nut on. This was on account of the condenser doors having to come off, the condenser being leaky. I have also re-screwed a main bearing bolt 3 1-2 inches. On board ship, time is a consideration. It was impossible to remove the bottom nut, therefore we took the top nut ashore and had three grooves slotted in and tap bolts fitted in the cant where the slot was, the slot being fitted with steel dies, having a thread on one side, and with a new nut on board we sailed away. I may mention that the old nut was split in the weld. However, we re-cut the bolt at sea. When we had the old nut we had to use a 3-4 inch 6 foot 6-inch stay rod, and bend it over the keep and clamped it under the bed plate.

Having been at sea a number of years I have had much experience both practical and humorous. Once, in going up to Buma on the Congo River in April, we struck on a sand bank. Of course we had to get a kedge anchor out. We fastened the anchor under the jolly boat and pulled it out aft and dropped it into the dark blood-colored river. Shortly afterwards the anchor came to the surface in the mouth of a hippopotamus, which towed the ship off the bank. But we had to lose the anchor.

Steam Gas Electricity Compressed Air Water

GOLDIE & McCULLOCH ENGINES.

THE accompanying illustration is of one of two vertical engines built by the Goldie & McCulloch Co., Limited, Galt, Ont., for the Dominion Iron & Steel Co., for their power house at Sydney, N.S. The valve motion of these engines is of the Corliss type, similar in construction to the standard for horizontal engines made by this company, with steam actuated dash pots. This style of dash pot enables the engines to be run at a higher rate of speed than is usual with this type of engine. Both high and low pressure cylinders are fitted with separate eccentrics for actuating the steam and exhaust valves, and the cut-off of both cylinders is under the control of the governor. This latter feature is essential to the proper regulation and economy of engines operating on a greatly varying load and is especially desirable in a case where direct driven alternating current generators are to be run in parallel. If the low pressure cylinder is not so controlled, but has fixed cut-off the division of load between the two cylinders will vary with every change of load, the high pressure cylinder carrying the greater proportion of the total at light loads, and the low pressure at heavy loads. As above stated the closing of the admission valves is accomplished by steam pressure. When the valve is opened an extension of the dash pot spindle is pushed into a small steam cylinder against pressure and when released the valve is closed rapidly, giving a sharp cut off. The necessary cushion is effected by an air cylinder placed at the opposite end of the dash pot spindle. The top of this air cylinder is adjustable so that the latch plate arm on the valve spindle can be made to come to rest at its proper place. The steam and exhaust valves are double ported. The valve seats are lapped out and the valves ground to gauge. The edges of the cylinder ports are planed in a special planer. The oiling is effected from a central reservoir with pipes leading to the various places to be oiled.

The diameter of the high pressure cylinder is 21 inches, the low pressure cylinder 42 inches, and the stroke is 30 inches. The speed is 150 revolutions per minute. The main bearings which are fitted with removable shells, are 14 inches diameter and 28 inches long. The crank pins are 6 3-4 inches diameter by 8 1-4 inches long. The fly-wheel is 12 feet in diameter and weighs 32,000 lbs. The total height of this engine above the floor line is 19 feet. The governor is of the "Rites" inertia type, and is es-

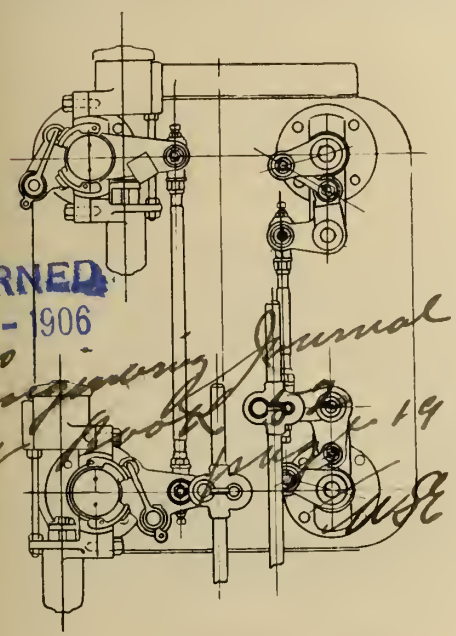
pecially adapted for the parallel running of alternators and for other purposes where extremely close regulation and quick action are necessary.

The engines are direct connected to sixty cycle alternating current generators of 600 K.W. capacity.

TURBINE PUMPS WITH BALANCED IMPELLERS.

THE continuing commercial development of turbine pumps is illustrated by the accompanying illustrations* of a line of turbine pumps recently brought out by the Buffalo Steam Pump Co., which line of pumps is to be made in Canada by the Canadian Buffalo Forge Co., Limited, Montreal.

The main feature of this line of machines is the use of back-to-back impellers (for approximate balance of thrust), supplemented by a carefully-designed arrangement of thrust-chambers



Valve Gear—Goldie &McCulloch Engine.

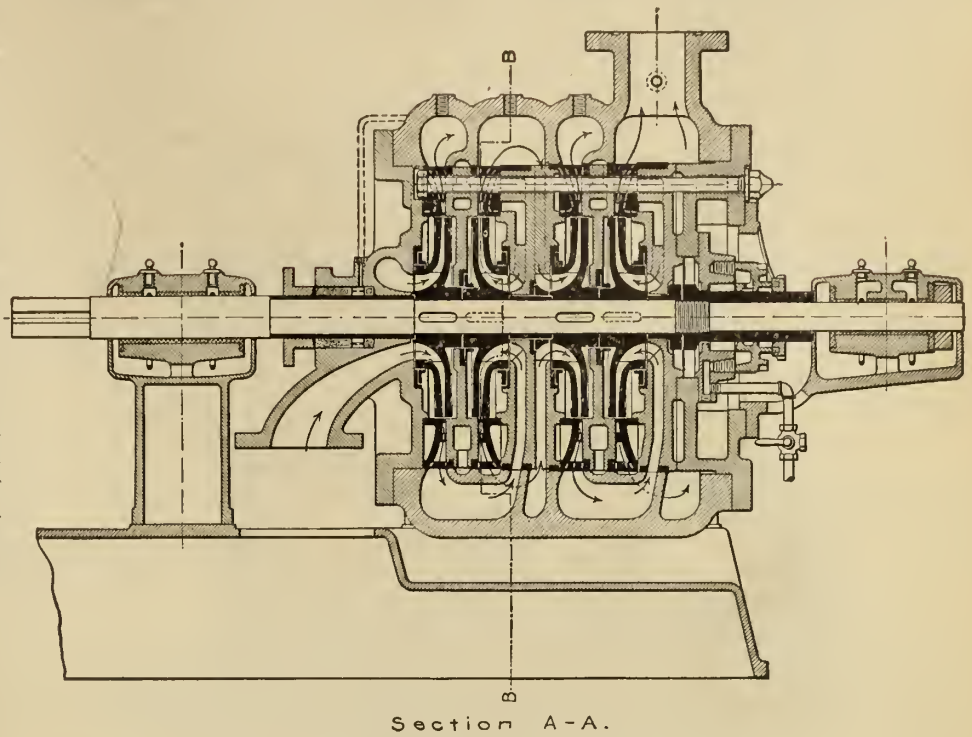
and Steam Engineering

quite similar to those frequently used in single horizontal-shaft Francis turbines. Balancing multi-stage turbine pumps by the back-to-back arrangement is not a new principle in this branch of machine design, but it has not found universal adoption. The fact that it makes more difficult the proper design of the water passages (with regard both to construction and to operation of the pump) doubtless has something to do with this. The pumps here described, however, show water passages of satisfactory simplicity and a general design that should prove cheap in machine work and assembling. Other important features of these pumps are, first, the separation of the functions of shaft-bearing and stuffing-box, and, second, the use of double stuffing-boxes to prevent leakage along the shaft.

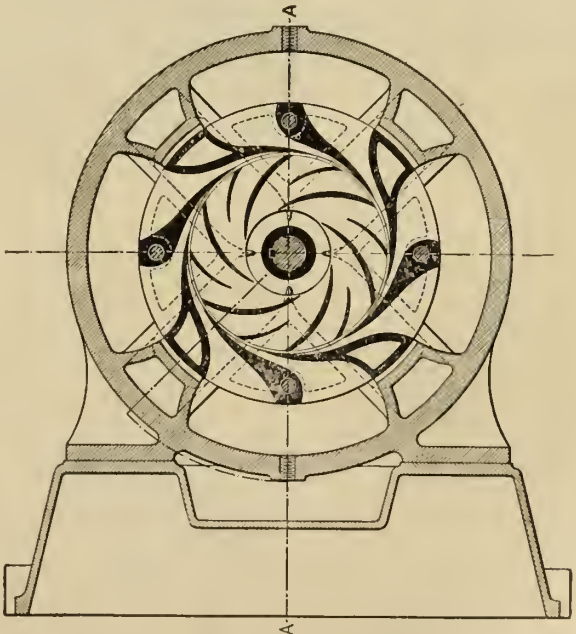
Figure 1, an axial section through a four-stage Buffalo turbine pump, shows the arrangement of the impellers or runners and of the water passages. The latter are more clearly explained in figure 2, a cross-section at right angles to the shaft. The pump consists of two main portions: (1) an outside cylindrical casing, in which are cored the discharge chambers of the several component turbines or "stages," and (2) within this casing an aggregation of plate-like guide castings, in which are formed the diffusion or guide vanes and the water passages leading from the discharge chambers to the suction sides of the respective following units. Running in completely enclosed circular spaces between these guide sections are the runners.



Section A-A.

Fig. 1—Longitudinal Section of Four-Stage Turbine Pump.

The aggregation of guide sections is assembled outside of the casing, with the runners or impellers put in place and keyed on the shaft as the assembling progresses, and is then bolted together by four through bolts in the manner



Section B-B.

Fig. 2—Transverse Section of Four-Stage Turbine Pump.

* For these illustrations Canadian Machinery is indebted to Engineering News.

shown in figure 1. The assemblage of working parts is set into the casing from one end, and is held in place by screws in the flange of the last section, which forms the end-plate of the pump

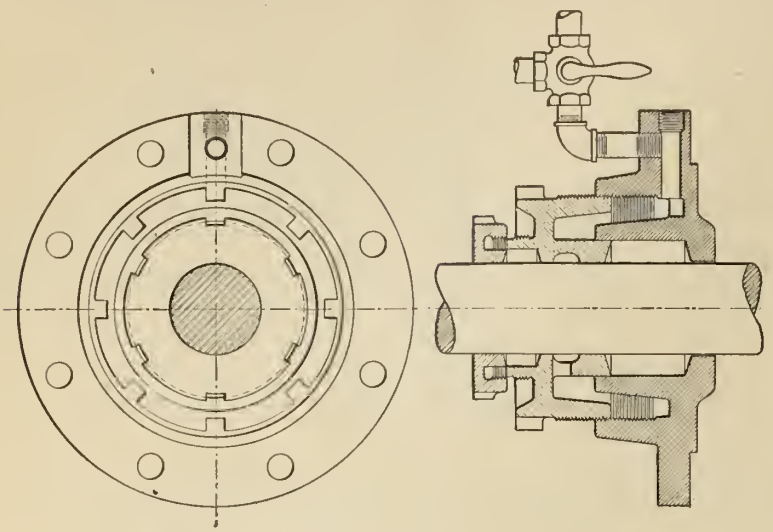


Fig. 3—Double Stuffing Box at Delivery End of Shaft.

ease at the delivery end. In order to facilitate the work of placing it into the casing, the several ring-shaped seats on the internal surface of the case are of successively smaller diameter. At each of these seats the corresponding guide section contains a brass ring turned to a force-fit in its seat, but small enough to pass easily through all seats farther to the right (in figure 1). The assemblage is thus easily entered in the casing up to the short distance of force-fit, when all the brass rings are simultaneously pressed home to a tight fit.

The shaft bearings are wholly outside of the case. The main bearing (at the left in figure 1) is in a pedestal set on the base-plate, while the out-board bearing is formed in a bracket bolted to the end-plate of the casing. The ends of both bearings are fitted with babbitted shoulders, against which bear collars on the shaft, to regulate end-play and to take up any slight thrust not balanced within the pump. Where the shaft passes through the casing, stuffing-boxes are provided. Thus the bearings are not required to act as packings, and the packing is not required to carry load, an arrangement conducive to long life of both packing and bearings.

The stuffing-boxes are, as already noted, designed with special view to preventing leakage. They are double-packed with two packings in series. The stuffing-box on the delivery side, whose construction is shown more in detail in figure 3, has two separate glands, the outer one being formed in the inner follower. The latter is so shaped as to form a leakage pocket between the two packings, and this pocket is drained by a drip-pipe; thus no pressure can accumulate in the space between the two packings, and the outer packing has to take care of only the moisture creeping along the shaft from the inner packing. The suction end stuffing-box is of somewhat simpler construction, having but one gland and one follower, with two packings kept apart by a separator. The space between the two packings is connected by a pipe to the delivery side of the first stage of the turbine, to form a water seal and prevent the leakage of air into the suction chamber.

Where the shaft passes through the stuffing-boxes it is protected by brass or composition sleeves, and a similar sleeve is placed over the section of shaft between the two pairs of impellers. This results in giving the shaft a complete non-corrosive covering from outside to outside of stuffing-boxes.

To balance the end thrust produced by the difference of pressures on the front and back of each impeller, thrust-chambers are formed between the outer faces of each impeller and the adjoining guide castings, in which water from the delivery side of the respective impeller accumulates and produces a thrust proportionate to the exposed area of impeller face. These chambers are sealed off from each other by brass packing rings of special construction, which prevent the flow of water from the high to the low pressure spaces outside of the impellers.

Figure 4 is a detail section of such a seal ring. The ring, which has a ground fit on the hub of the impeller, is held from rotating, but has a slight radial play, so that it can adjust itself to the eccentricity and vibration of the rotating parts. A brass seating ring is fixed in a recess in the face of the guide section, and the packing ring is held against this seat by three studs which pass through slotted holes in the packing ring. The long axis of these slots is radial to the shaft, so that the packing ring can shift slightly in all directions in a plane normal to the shaft. The brass seat against which the packing ring bears insures a tight joint on the radial face, and the ground fit of the packing ring over the impeller hub prevents leakage and loss of pressure through the circumferential joint.

Each thrust-chamber, being in com-

Simonds Canada Saw Co.—Plant where Large Gas Plant is being Installed.]

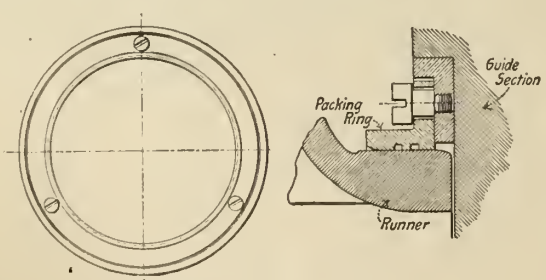

Fig. 4—Detail of Seal Ring for Thrust Chamber.

munication with the delivery side of its impeller by way of the radial clearance between impeller and guide vanes, contains water at the delivery pressure of that impeller. The two chambers produce thrusts in opposite direction, of an amount equal to their difference in area. This difference, in the present design, is so adjusted that for each pair of impellers the resultant thrust-chamber pressure just balances the difference of inlet opening pressures.

The balancing is thus accomplished separately for each pair of impellers, instead of providing a single balancing device for the entire pump, as is sometimes done. The method of thrust-chamber balancing is not restricted to pumps with back-to-back impellers, but can be applied just as well to any arrangement of runners. In fact, it is used also in the single-runner single-stage pumps of the same makers. In next month's issue of Canadian Machinery something will be said concerning the efficiency of these pumps as shown in two tests made.

GAS PLANT EXTENSIONS.

IN the June number was published a description of the Campbell gas engine and suction plant operating at the Simonds Canada Saw Co., St. Henri, Montreal. This company, after conducting very careful tests with this engine and gas plant, and keeping careful check of its performances generally, have decided to make all extensions in the way of power along this line, and have ordered from Wayland Williams & Dadson, 321 St. James street, Montreal, the Canadian agents for the Campbell Gas Engine Co., a large gas engine of 150 b.h.p., and a gas plant of 600 b.h.p. The gas plant is to supply gas for the two engines, and also for furnace work in the factory.

THE "NATIONAL" GAS ENGINE.

THE "National" gas engine, made by the National Gas Engine Co., Limited, Ashton-under-Lyme, Eng., is being placed on the Canadian market by the Economic Power, Light & Heat Supply Co., York street, Toronto, and the engines having some features not embodied in Canadian engines, a description of them will be of interest.

The engines are built on the "Otto" cycle, but many improvements have been made upon the original "Otto" engine. The engines are built for all classes of stationary engine work, and engines can be supplied to run on coal gas, natural gas or producer gas. Complete electric lighting plants can be supplied, consisting of a slow-speed dynamo, direct connected to engine. Although all the engines are built upon the same principle, in detail construction they differ very much, according to the class of work they are designed to perform.

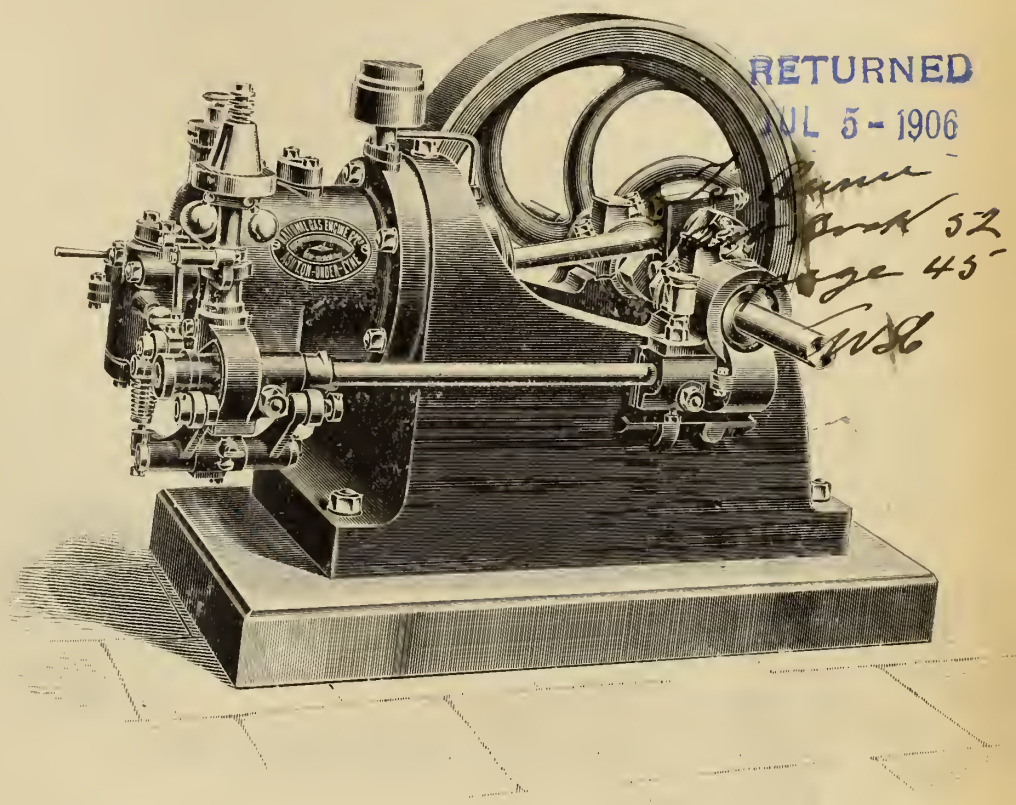
The engines are supplied with either the hot tube ignition or with the electro-magnetic. The ignition tube and the tube holder are something special. By a special patented holder the firm have found it possible to utilize the porcelain or clay tubes without fear of the latter breaking owing to unequal expansion of metal and porcelain. The system of electric ignition is by means of wipe spark, current being supplied by a magneto machine.

Engines of all sizes are supplied with loose liners for the cylinders and these when worn can be replaced at comparatively small cost, obviating the necessity of re-boring the cylinder. The governor is the fly-ball type, operating to regulate the gas supply according to the load. The valves are arranged so as to be easily cleaned and ground when required. The exhaust valve and spindle guide are part of the main casting, instead of being bolted on as in many engines. The air and gas valves are in a separate casting bolted to the back of cylinder. All valves have removable covers with ground joints.

The piston is lubricated from a sight feed lubricator; the bearings are constructed with large oil wells with syphon wicks; and the crank pin and piston pin are lubricated by patented devices. The oil cup for the crank pin bearing is attached to the engine bed close to the crank bearing. The oil from the cup passes down a tube and locates itself upon a circular ring which is part of the crank brasses. A steel wiper trailing around this ring conveys the oil to the crank pin brasses. For the lubrication of the piston pin a cup is formed on the top side of the connecting rod steps, and a tube inserted in the piston immediately above it. Oil passes from the cylinder lubricator to a recess on the upper side of the piston, and thence through the tube to the piston pin brasses.

Special types of piston pin and connecting rod end are used. A shaped head is formed solid with the connecting rod and two half bearings embrace the piston pin and are bolted to connecting-rod head by special bolts.

The illustration shown is of a type of engine specially designed for small units, being equipped with all the modern improvements.



National Gas Engine.

The West Branch Jocko Co., Limited, Hawkesbury, Ont.; capital, $20,000; purpose, to construct and maintain dams, slides, piers, etc., for the transportation of timber, etc., down the Jocko River, and to collect a toll for the use of same. Directors are: H. Robinson, T. T. McWaters, Hawkesbury; H. K. Egan, R. L. Blackburn and A. Blackburn, all of Ottawa.

ABOUT CATALOGUES

By mentioning Canadian Machinery to show that you are in the trade, a copy of any of these catalogues will be sent by the firm whose address is given.

Helpful Hints on Farm Power— A booklet published by the Fuller & Johnson Mfg. Co., Madison, Wis., on gas engines as adapted for farm use, discussing their frost-proof engines for outside use the year round.

Gasoline Engines. A catalogue published by the Fuller & Johnson Mfg. Co., Madison, Wis., describing and illustrating their frost-proof gasoline engines. The catalogue is well illustrated; size, 6 x 9 inches.

Finishing Armature Spiders. A leaflet from the Gisholt Machine Co., Madison, Wis., illustrating and describing the finishing of armature spiders on their 24-inch standard turret lathe, motor driven. The engravings are excellent.

Small Power Motors. Circular No. 1128 of the Canadian Westinghouse Co., Limited, Hamilton, illustrating and describing small motors for application to work such as coffee mills and ice cream freezers.

Electro-Static Volt Meter. Circular No. 1130, of the Canadian Westinghouse Co., Limited, Hamilton, illustrating and describing in detail their electrostatic volt meter for the measurement of high voltages.

Foundryman's Note Book. A neat little foundryman's note book distributed by F. L. Crobaugh, M.S., Cleveland, at the recent foundrymen's convention in that city.

Exhaustive Arguments. A leaflet issued by the Ohio Blower Co., Cleveland, O., telling about their "Swarwont" cast iron exhaust heads.

Money Savers. A booklet issued by the Cleveland Wire Spring Co., Cleveland, O., describing and illustrating their steel receptacles for shop purposes. These include receptacles for tools, bolts and nuts, machine parts, oils, sand and many similar things.

Maywood Molding Machines. The 1906 catalogue of the Maywood Foundry & Machine Co., New York, illustrating and describing the Maywood molding machines. The illustrating is excellent and the good points in the machines are pointed out clearly and concisely. Size, 6 x 9 inches.

A Model of Simplicity. A booklet issued by the Ohio Blower Co., Cleveland, O., giving an original and interesting account of the principle of the "Swartwont" steam separator.

Economy. A booklet sent out by the Osborne Mfg. Co., Cleveland, O., pointing out the good points in their wire wheel brushes, and the economy obtained by their use.

Turbines and Generators. Bulletin 1504 of Allis-Chalmers-Bullock, Limited, Montreal, giving a very complete description of the Allis-Chalmers steam turbines and generators. Special attention is directed to the arrangement of "balance pistons" on page 9 of the bulletin and the arrangement of "blading" on page 13. The bulletin is well illustrated and is of great interest.

Saws. The general catalogue of the Tabor Manufacturing Co., Philadelphia, illustrating and describing the Taylor-Newbold Saw, which saw is adapted to meet the requirements of steel foundries, rail mills and structural steel works. The catalogue is 6 x 9 inches, and is excellently illustrated.

Chain Hoists. A booklet issued by the Chisholm & Moore Mfg. Co., Cleveland, O., illustrating and describing their chain hoists and I-beam trolleys.

Tabor Molding Machines. A very handsome catalogue gotten up by the Tabor Mfg. Co., Philadelphia, illustrating and describing their power ramming split pattern machines and their vibrator frame power ramming machines. The catalogue is well illustrated with cuts of the machines themselves and also of the work done on them. Size, 6 x 9 inches; cloth bound.

Choosing a Concrete Mixer. A booklet printed by the Municipal Engineering and Contracting Co., Chicago, containing an article by Clarence Coleman, M. Am. Soc. C. E., on "The Efficiency of Concrete Mixing Machines." The booklet is well illustrated.

Thermit. A booklet issued by the Goldschmidt Thermit Co., 43 Exchange Place, New York, on "Thermit and What You can do With it." The booklet reviews in an attractive style the current thermit practice, and is illustrated with sketches of the different processes.

Diamond Flask and Core Machine. A circular illustrating and describing the Diamond standard taper snap flask and the Diamond universal core machines, made by the Diamond Clamp & Flask Co., Richmond, Ind.

Convention Car Builders' Association. The Ingersoll-Rand Co., 11 Broadway, N.Y., have published a little booklet containing photos of the officers of the company and the salesmen in the different large cities. It is also a souvenir of the recent convention of the American Railway Master Mechanics' Association and the Master Car Builders' Association.

The Standard Sand & Machine Co. The general catalogue of the Standard Sand & Machine Co., Cleveland, O., illustrating and describing their labor saving machinery for foundries and also their concrete mixers, gas and gasoline engines, etc.

Foundry Chaplets. A booklet issued by W. W. Lindsay & Co., Philadelphia, Pa., describing and illustrating the method of manufacture of the Lindsay chaplets and anchors.

Burk Machinery Co. Circulars of the Burk Machinery Co., Cleveland, O., illustrating and describing their machine tools including sensitive drill presses, milling machines, index centres, miller and drill press vise, tapping machines, oil forges, etc.

Gas Plants. A catalogue issued by Crossley Bros., Limited, Openshaw, Manchester, Eng., illustrating and describing their suction and pressure gas plants. It is well illustrated with half tones showing installations and also illustrations showing sectional views of the plants. Size, 9 1-2 x 11 inches.

Foundry Appliances. A general catalogue gotten out by the W. W. Sly Mfg. Co., Cleveland, O., illustrating and describing their foundry appliances. This catalogue shows their latest achievements in tumbling mills and other foundry appliances, including incorporators, exhaust fans, sand mixers, dust arrestors, etc. The catalogue is supplemented with several foundry roof designs, which should prove of considerable interest to anyone interested in foundry building. The catalogue is well illustrated and is 6 x 9 inches in size.

REVERSING VALVE FOR GAS FURNACE.

BEING radically different from valves hitherto used in connection with gas furnaces, the type developed by Mr. J. A. Dyblie and placed on the market by the Morgan Construction Co., of Worcester, Mass., is of interest.

The construction and operation of the valves are illustrated in the accompanying drawings. Fig. 1 shows a plan and elevation in one of the operating positions. Fig. 2 shows valve raised and turned 90 degrees, and ready to drop into the water seal to reverse the path of the gases, as shown in Fig. 1. The openings 1 and 3 are connected to the furnace, the opening 4 to the stack, and 2 to either the gas or air supply. There is no overhead flue connection to a valve of this character. Over the openings to the flues 1, 2, 3 and 4, is placed an inverted cylindrical box, provided with a single partition running across on the diameter. This partition is shown at (A) in the elevation Fig 1. The edges of the box and of this partition dip into the water seal casting (T), thus preventing any escape of the gases to the outside air. With the valve in the position shown in Fig. 1 there is a free opening between ports 1 and 2, and between 3 and 4. Thus the passage of the gas or air will be from 1 to 2, and thus into the furnaces. It returns through 3 into 4 and thence to the stack. If the valve, however, is turned through an arc of 90 degrees so that the partition (A) rests along the line (YY) in the plan, Fig. 1, the passage of the gas or air would be from 2 to 3 and from 1 to 4 and thence to the stack.

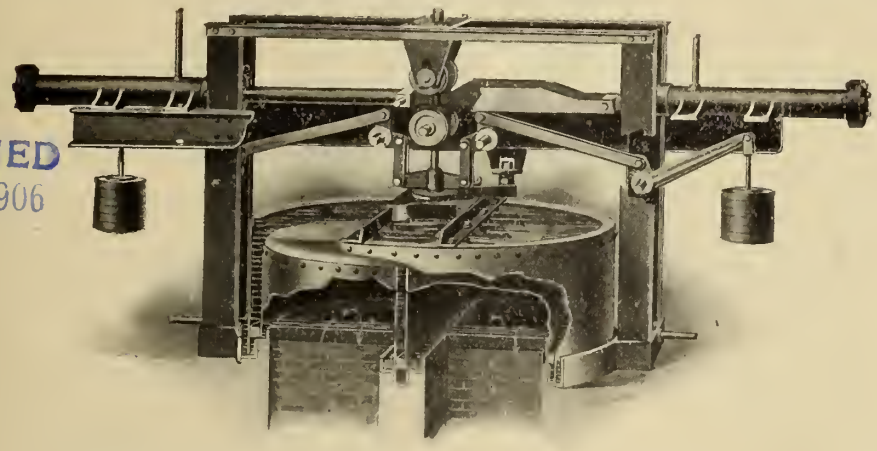

Fig. 1. The Dyblie Reversing Valve.

To reverse the valve it is necessary to raise the valve body a sufficient distance to allow the centre partition to clear the edges of the water seal before the valve is turned. The edges of this centre partition are accordingly made shorter than the lips at the circumference, as shown in Fig. 2. This permits the valve to be turned without breaking the water seal. The mechanism by which this is accomplished is as follows: The weight of the valve is borne by the wheels (B), attached to the spindle (C), which is arranged to permit a free vertical movement. The wheels ride on cam bars (D), which are operated by the two cylinders (EE) on either side of the valve. If the cam bar be pushed one way or the other the wheels (B) will ride up on the cam, and the entire valve be lifted.

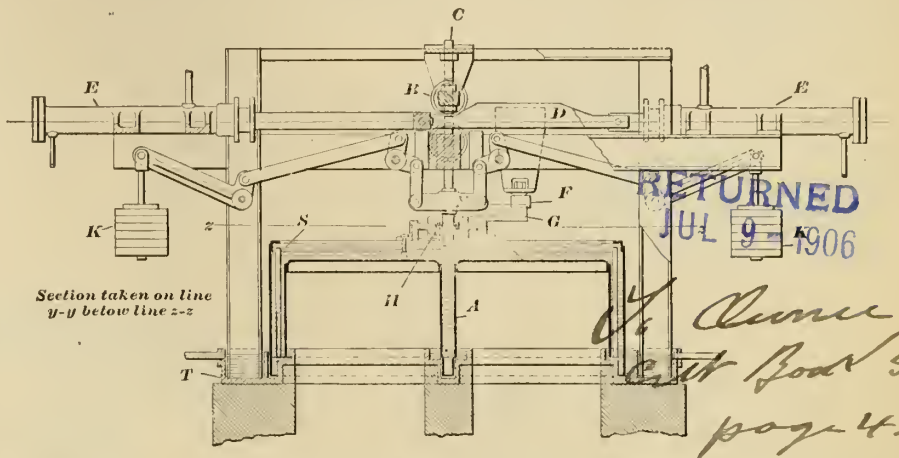

Fig. 3.—Valve in Elevation.

The turning of the valve is accomplished by the roller (F), which is rigidly connected to the cam bar (D). The roller engages the channeled arm (G), which is attached to the valve. As (D) is moved the roller (F) engages the arm

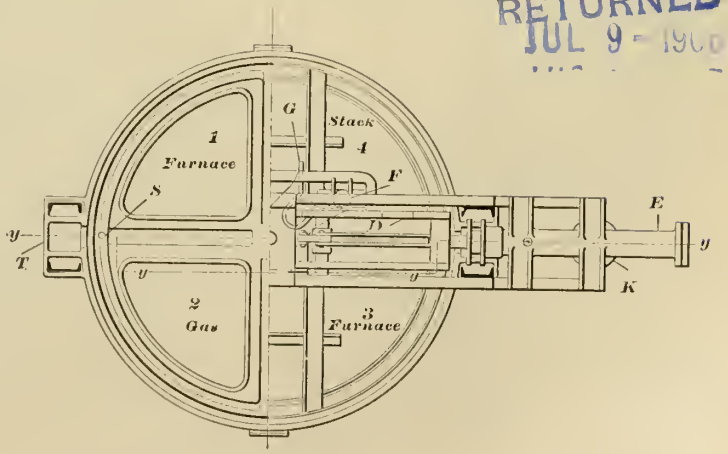

Fig. 2.—Plan of Valve.

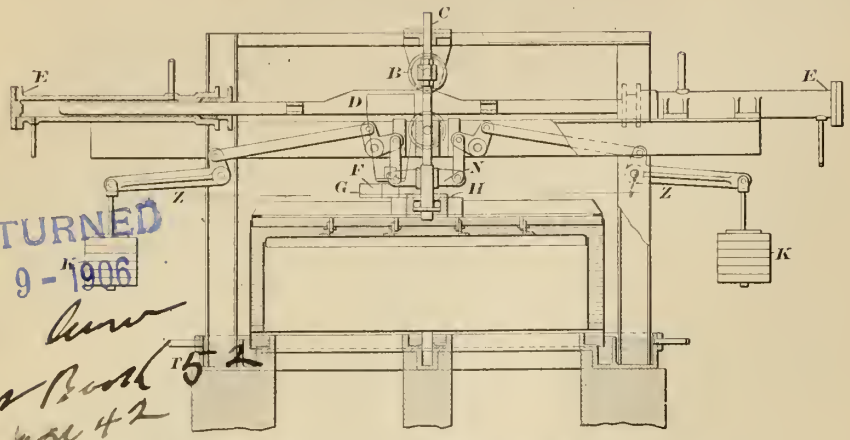
RETURNED JUL 9 - 1906

(G) and turns it, and consequently the valve, through the necessary arc. As the cam bar reaches the limit of its travel, the wheels descend on the opposite incline, and the valve settles in its new position. The process is repeated in the opposite direction on reversing the valve. The use of two operating cylinders makes it possible to provide an operating mechanism without any inside packed joints. The valve is counterweighted by the weights (KK). The ball-bearing collar (H) at the centre of the valve renders the turning of the same comparatively easy.

The valve itself is surrounded by a second cylindrical box, open at the top, which is filled with water and forms a water jacket.



Section taken on line y-y, below line Z-Z but with valve turned 90°

JOHNS PATENT BEAM SHEARS.

THE Johns Patent Beam Shears, made by Henry Pels & Co., 68 Broad street, New York, are shown in the accompanying illustrations. In bridge and structural iron works, boiler shops, ship yards, etc., there is a continual demand for structural shapes of different lengths, and this condition creates a demand for some kind of rapidly cutting-off tool. For this purpose there are cold saws, high speed saws and hydraulic beam shears, besides the Johns Patent Beam Shears. Cold saws do good work and require practically no attention, but they are slow. The drawbacks to the high speed saws are the large amount of power they require, and the roughness of the cut made. The hydraulic beam shears cut nothing but beams and channels, and the knives have to be changed for each section.

It was with an idea of overcoming these difficulties experienced with existing methods of cutting off structural shapes, that the Johns Patent Beam Shears were devised. The advantages claimed for these shears are briefly: Quickness of doing work, small amount of power used, same knives do all kinds of work, i.e., they cut angles, tee-bars, or zee-bars, as well as beams and channels. The quickness of doing work is shown in the fact that a 15-in. beam can be cut in 15 seconds. The small amount of power used is due to the patent lever mechanism used in the shears. The 24-in. beam shear requires 15 h.-p.

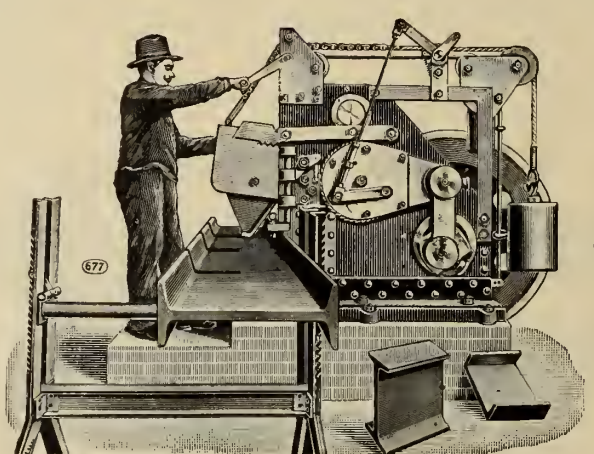

Fig. 1.—Johns Patent Beam Shears.

As may be seen from figure 1, the shears are built with a frame of steel plates, which accounts for the comparative lightness of the shears. All the parts are comparatively simple and are easily accessible.

Figure 2 shows a trimming attachment for the shears, which will cut off straps as narrow as $\frac{1}{4}$-in. from structural shapes. The shapes as delivered from the rolling mills are usually slightly longer than specified, and hence the necessity for trimming. The shears can also be fitted with coping knives for cutting off flanges of beams, channels, etc.

Figure 3 illustrates the way in which the different shapes are cut. The operation of the shears is simple. The shape to be cut is placed upon the lower knife block. The upper knife is lowered, the machine thrown into gear, and by pressing down the handle at the left side of the machine the knife is forced through the shape. Angles and tee-bars are cut off at one stroke, but beams, channels and zee-bars must be turned over for a second cut.

JUL 9 - 1906

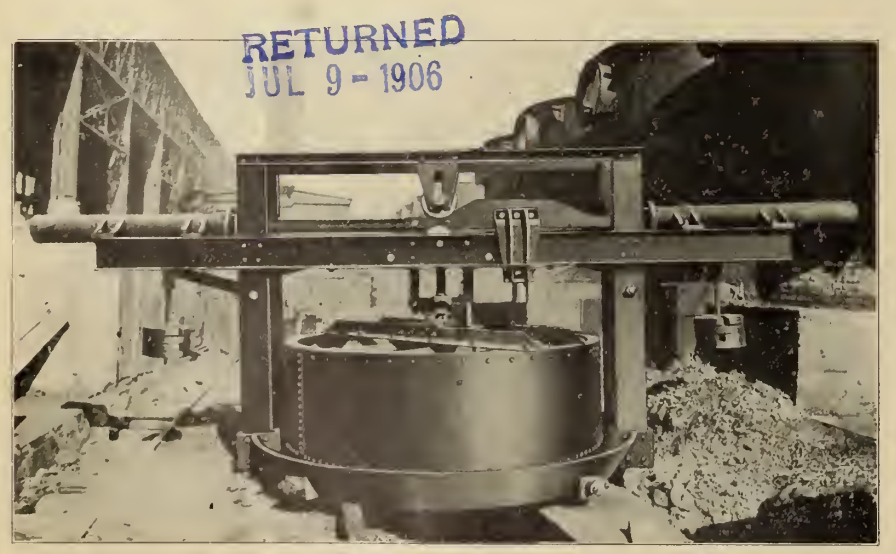

FIG. 5.—Valve in Process of Erection.

A SELECTOR SWITCH.

THE accompanying cut illustrates a selector switch made by the Toronto & Hamilton Electric Co., Hamilton, Ont. This is used largely on high potential circuits to open the main line to affect repairs, make alterations, etc. It is also used in main and sub-stations as a selector switch for connecting up transformers. It is intended to ensure the safety of the operator, it being opened from the ground by a long hooked pole.

RETURNED
JUL 5 - 1906

High Tension Switch.

SMART-TURNER DUPLEX PUMP.

THE accompanying illustration shows a duplex outside packed pump, provided with pot valves, as recently designed by the Smart-Turner Machine Co., Limited, Hamilton, Ont. It is particularly adapted to marine service, and as is seen, while the pump is outside packed, the plungers do not project outside the cylinders, thus avoiding any chance of the engineer being struck on the leg by a projecting plunger. Each valve is in its own pot, so that any one may be taken out by removing only two nuts. Any drip from the plunger glands is caught in a pan, so arranged that it may be carried away in a pipe. The steam end of the pump is of the standard duplex pattern. The whole pump takes up less floor space than the end outside packed pattern, which is so well known.

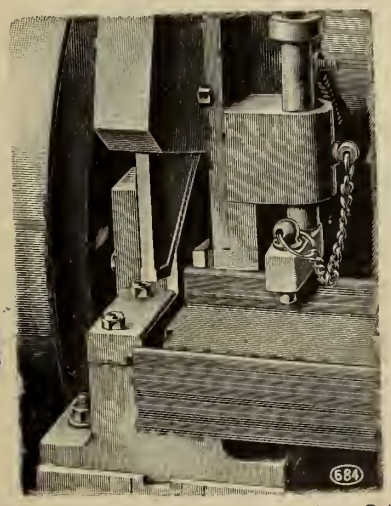

Fig. II.— Trimming Attachment: Johns Patent Beam Shears.

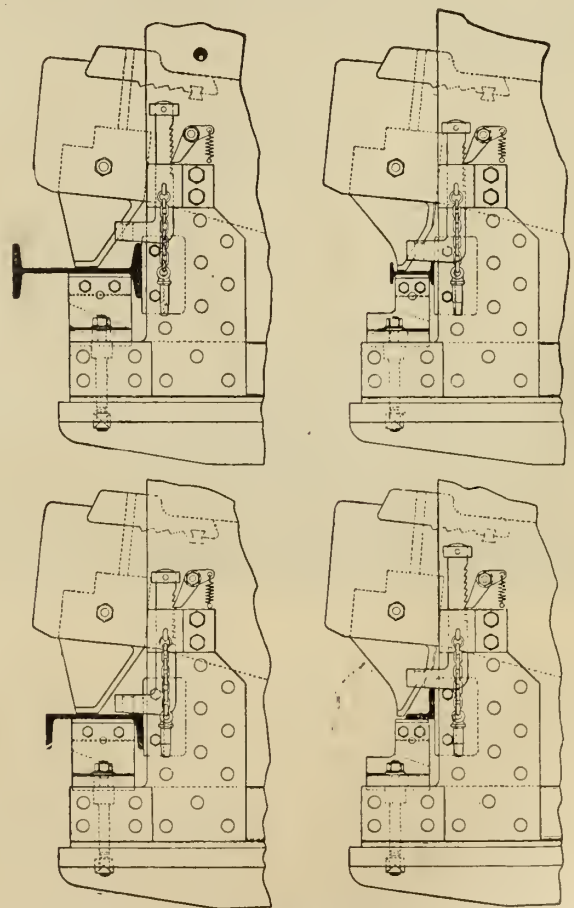

Fig. III.—Johns Patent Beam Shears, Showing Manner of Shearing Different Shapes.

NEW ELECTRIC FIRM.

The Electrical Machinery Co., of Toronto, have recently started up business at 115 Simcoe street, Toronto. The members of the firm are A. J. Phillips, manager; F. Marson, superintendent, and J. H. Harris, secretary-treasurer. The firm are making dynamos and motors, the machines being of their own design, and also do electric machine repair work of all kinds. All three members of the firm have had considerable experience in the design and construction of electrical machinery, having been connected at different times with several Canadian firms making dynamos and motors. They intend building up their business upon the merits of the machines they make, and consequently they spare neither trouble nor expense in the perfecting of them.

A Town Industrial

The Rise of a Manufacturing Centre in the Face of Adverse Conditions

By a Staff Correspondent

IN spite of the fact that the Town of Oshawa seems endowed with all the natural disadvantages with which Providence ever graced a community it has risen from an obscure hamlet to a manufacturing centre whose industries are known as household words throughout the Dominion. Without water-power, without natural gas, without cheap fuel, without natural transportation facilities—in fact, sans anything that goes to make for the building of an industrial community— this wonderful town has developed and prospered. As such it continues a reproach to better favored but less enterprising centres. The question at once arises "How was this accomplished?" It seems like a riddle of the Sphinx. The answer is found in the lives of a few remarkable men, some of whom are to-day living monuments to the possibilities of individual effort. Oshawa is further favored by having as a citizen a genius like Dr. Kaiser, whose courtesy in supplying much of the information herein must be acknowledged.

To go into history, it is apparent that from the start the town's very existence is due to men of powerful personality. These men have made a town distinguished for successful manufacturing industries. The first man to concern himself with the place in an industrial way was J. B. Warren. This was early last century. A fair water-power was at that time available and here he built a mill.

This water-power was the town's first and only attraction. The first manufacturer was A. S. Whiting, who was followed by a leader in the person of Joseph Hall, who was followed by F. W. Glen, his son-in-law, and T. J. Hall. As these men went down two men arose from the ruins, these being Hon. T. H. Gibbs, formerly secretary of state, and his brother, W. H. Gibbs. Throughout their lifetime these two were the mainstay of the struggling hamlet of Oshawa. During a period of depression in manufacturing they became financially involved and were unable to tide over the depression. When they were prosperous they did much for the town and any progress made twenty-five or thirty years ago was due to them.

As the Gibbs brothers were shifting from the arena of activity there sprang up two most remarkable men the Town of Oshawa has yet seen, men who have accomplished for Oshawa what others were unable to do. These are John and W. F. Cowan, who are known throughout Canada in industrial and financial circles. To their business ability, enterprise and brain power the present prosperity of Oshawa is due without any doubt. These men established some of the greatest of Oshawa's industries, but in starting the Western Bank, which constitutes the hub around which the whole wheel of Oshawa spins, they rendered the greatest service.

Chelsea Falls, on the Gatineau River.

Oshawa's Hub.

The Western Bank was started in 1882 as a local financial centre, but has since established branches in many of the neighboring counties. The president is John Cowan and the board of directors includes W. F. Cowan. The man-

aging director is P. H. McMillan, and to his close application to business much of the success of the bank is due.

It may be surprising to think that the influence of a bank should have been the means of creating industries from the fact of its rare occurrence. Being the head office and in close touch with all her people, the management of this financial institution were in a position to aid and build up when a branch manager under the present laws of banking would be powerless to assist. It is a broad statement, but true, that with one exception the important manufacturing interests of Oshawa to-day owe their present status to the helping and guiding hand of the Western Bank. In earlier days a branch office of another bank was started there but did nothing to build up the town industrially and later closed its doors.

The principle on which the town has been built up lies in the fact that since the bank was started no man of character and ability desirous of manufacturing in Oshawa has been refused assistance by the bank. In spite of this principle, few bad debts have been made. In one case a firm was in bankruptcy when the town bank took hold and it is now one of the largest organizations of its kind. Mr. McMillan stated that the bank never hampered an account and so did not upset the calculations of worthy manufacturers.

Some Industries.

Whilst it was mentioned at the outset that Oshawa was without natural transportation facilities, it was meant that the town had neither water connection nor situation on the main line of a railway, yet manufacturers are specially favored with an electric line running to Oshawa Junction and which has a switch running to every plant.

Some of the foremost industries in the town include the McLaughlin Carriage Co., the Pedlar People, manufacturers of roofing and sheet metal goods; the R. S. Williams Piano Co., the Schofield Woollen Mills, the Ontario Malleable Iron Co., and the Oshawa Steam & Gas Fitting Co. In addition to these there are the canning factory and several other metal industries. The Ontario Malleable Iron Co., which is now employing between four and five hundred men, is making arrangements to double its capacity and will in the course of a year employ twice as many men. The same is true of the Oshawa Steam & Gas Fitting Co., who now employ about three hundred hands.

Many a town in the country with infinitely better facilities for manufacturing, has been at a standstill when Oshawa has gone ahead. Every town has men of latent resource who, if they have the courage and energy, could live to have the satisfaction of having seen their native or adopted town become an important industrial centre through their efforts. May the example set by the princes of industry in Oshawa be followed in other centres.

Convention of O. A. S. E.

At Hamilton on May 28, the Ontario Association of Stationary Engineers held its annual convention, with about sixty members present. The chief topic of discussion in convention and in private conversation, as was to be expected, was the compulsory license law, and there appeared to be general satisfaction with the measure.

From the retiring president's report it would appear that the association have had a prosperous year, a large number of new certificate holders having been added to the lists. It was also pointed out in the report that the Ontario Association of Stationary Engineers had not been legislated out of existence as was supposed by some, but that the "Act Respecting Stationary Engineers" under which the association had been incorporated had merely been amended by the new bill by the addition of several new sections, the chief feature of the amendment being that after another year the board of management will be appointed by the Government instead of being elected by the association.

The election of officers resulted as follows: President, A. M. Wickens; vice-president, W. A. Sweet (acclamation); board of examiners, W. Blackgrove, W. Sweet, A. M. Wickens and A. E. Edkins; treasurer and registrar to be appointed by the board of examiners.

* * *

Air Brake Convention.

An important convention of the American Air Brake Association was held in the Windsor Hotel, Montreal, from the 5th to the 8th of June. About two hundred and fifty members, comprising representative steam railroad men from the operating departments of all the leading roads of America came together for this convention, which is the first ever held by the association outside the United States.

The programme of entertainment included the annual ball, which was held in Stanley Hall on the evening of June 5, a trip to Ottawa by special train on June 6, and a trip to Quebec, where the delegates were taken on a special Intercolonial train, Thursday afternoon, June 8. While in Quebec the visitors were taken care of by the Quebec Light & Power Co., who entertained them at lunch at the Kent House.

During their visit in Montreal, the visitors had extended to them the courtesies of the Montreal Street Railway Co., each delegate receiving a complimentary book of tickets.

Milling Cutters : How They are Made, Used and Abused.

By John Edgar.

ARTICLE III.

WE have now come to what will prove to be the most interesting part of the series, the milling of the cutter. The machine that is generally used in making milling cutters is

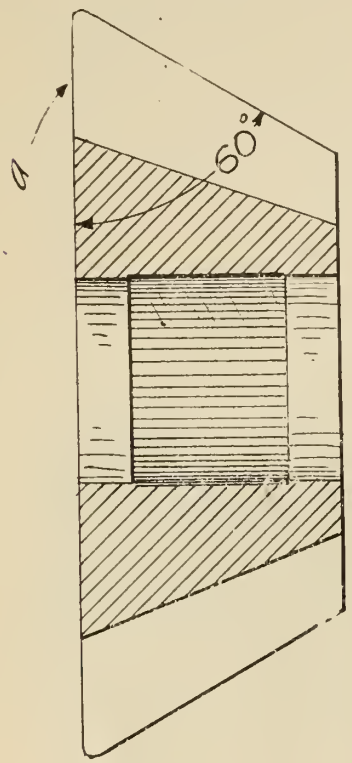

Fig. 10.

the Universal milling machine, although straight or plain cutters which do not have spiral teeth may be cut on a plain machine, when it is provided with centres for holding and indexing the work.

The work is held between the centres of the spiral head in a manner similar to the methods used in ordinary lathe work, care being used to make certain that the arbor runs true, is well supported on the centres and that the dog is locked in place to prevent any back lash which would otherwise occur. Most machines are provided with a carrier into which the tail of the dog is slipped and secured by set-screws.

When many cutters are made having the same size hole it is good policy to provide an arbor with a shank fitted into the main spindle of the dividing head. This makes a much stiffer and an altogether better arrangement.

In selecting the cutters for use in cutting the teeth of milling cutters, much, of course, depends on the style cutter being made. In making ordinary plain mills a single angle cutter like figure 10 could be used. This style cutter does not produce the best class of work but it is simple and cheap, which qualities appeal to a great many users. They may be improved by making the sides or ends of the cutter hollow or concave so as to reduce the drag to the minimum. Much better results can be obtained when teeth are cut on the side (a). Even then when this straight face is used to cut the radial face of the cutter it leaves a series of scratches due to the untruth of the cutting edges. These cutters are furnished regularly with angles of 45, 50, 60, 70 and 80 degrees, varying in size from $2\frac{1}{2}$ to $3\frac{1}{2}$ inches diameter, usually with a 1-inch hole which is generally the standard size hole for this kind of work. It is much better to have but one size of hole than to have a number of sizes for which there are no suitable reasons.

Another item which has caused unlimited trouble is the key-way. Many cutters having the same size hole may be found with different size key-ways. In table III is given the standard adopted by the cutter manufacturers and which represents the present practice of the best makers of cutters to-day. The key used is of square stock.

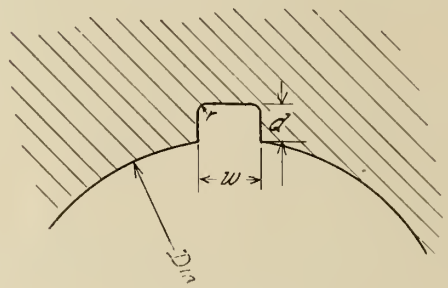

TABLE III.

STANDARD KEYWAYS FOR CUTTERS.

Diameter of hole.			Width of key. (w)	Depth of keyways. (d)	Radius (r)
3-8″	to	9-16″	3-32″	3-64″	.020″
5-8	to	7/8	1/8	1-16	.030
15-16	to	1-1/8	5-32	5-64	.035
1 3-16	to	1 3/8	3-16	3-32	.046
1 7-16	to	1 3/4	1/4	1/8	.050
1 13-16	to	2	5-16	5-32	.060
2 1-16	to	2 1/2	3/8	3-16	.060
2 9-16	to	3	7-16	7-32	.060

If an attempt is made to use the single angle cutter in milling spiral teeth a result such as shown in figure 11 would be obtained. It is easily seen that this would not be satisfactory. The trouble is caused by the twist of the spiral. This eliminates this style cutter from being used on this class of work. A spiral groove having a straight radial side cannot be produced by a cutter which has a cutting profile composed of lines any of which are perpendicular to the axis of the cutter. A cutter suita-

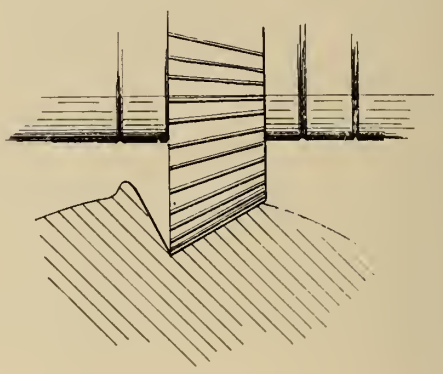

Fig. 11.

ble for spiral milling must have a double angle as shown in figure 12.

These double angle cutters are usually made with one cutting edge of 12-degree, and the other at 40, 48 or 53-degree angle, the one to use depending on the size of the cutter and the number of teeth it contains.

In table IV is given the angle of the cutter required for different diameters and numbers of teeth. This table should

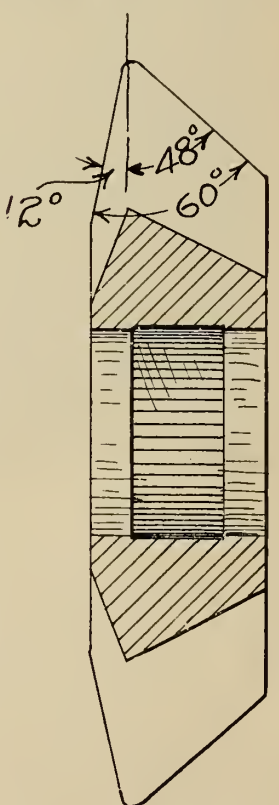

Fig. 12.

prove interesting, as it is the first time that an attempt has been made to place

the information in suitable form for reference.

All single angle cutters are set so that the straight side (9) is directly over the

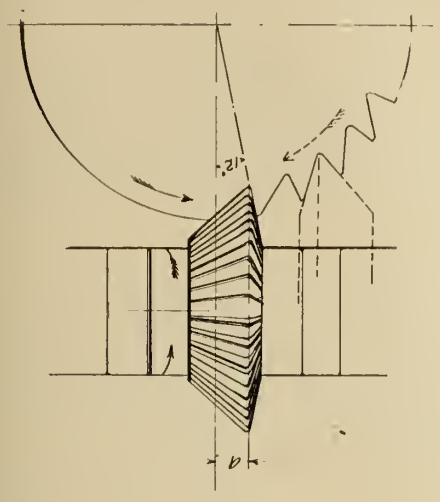

Fig. 13.

centre of the blank, so that this side produces the radial face of the tooth. Double angle cutters are set so that the sharp angle side produces this radial face, and in order that it may do so the cutter must be set off the centre of the blank an amount which is dependent on the diameter of the cutter being cut. Figure 13 shows a double angle cutter in the cut, the set-over being (a).

The setting of the cutter off centre should be done before the table of the machine is swiveled to the angle of the spiral to be cut.

In milling the teeth of spiral mills it has been found that the work should rotate against the side of the cutter which has the greater angle as shown in figure 13, where the rotation of the cutter and work is indicated by the arrows.

The figure shows a view of the work looking from the tail stock end with the direction of the feed piercing the paper. The cutter being milled is then a right-hand cutter with a right-hand spiral. If it were desired to make the spiral left-hand, then the blank would be rotated in the other direction, which in order to observe the above recommendation the cutter would have to be set in a position shown by the dotted lines. The great difficulty in observing this rule would be the increase in the size of the cutters required.

In making the divisions different methods may be employed, the method used depending on the head on which the work is being done. We have four methods in common use. These are: Direct, plain, compound and differential indexing.

Direct indexing is that method in which the index dial or plate is attached directly to the spindle, the divisions being made by detents in this plate into which a pin is dropped. In plain indexing the plate is stationary and a crank is attached to a worm shaft and the worm engaging a worm gear on the spindle. The crank carrying the index pin transmits its motion to the spindle through the worm and worm gear. The advantage of this method is that a greater number of divisions may be obtained with greater accuracy than is possible with the direct method. The

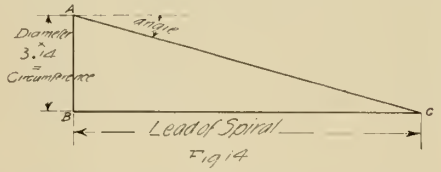

Fig. 14

compound index is a modification, or what might be called an extension, of the plain method. In this method both sides of the plate are used, using two rows of holes, one on either side of the plate, the pin engaging one side, usually the rear, of the plate being fixed and the other, the pin in the index crank. The index crank is rotated through a definite number of holes (a fraction of or any whole number of revolutions), then the crank is locked to the plate and the plate is given a movement in either direction as desired through a certain range of the holes on the rear, thus producing a compound movement of the spindle. This method has not become very common on account of its complexity. The differential method of indexing is an outcome of a desire to obtain a method by which we might divide a blank into any number of divisions, whether even or prime. This is accomplished by connecting the spindle to the index plate by a suitable train of gears and so produce the compound movement of the dial and index crank as in the compound method. The method of plain indexing answers all the requirements of the process of milling the teeth in cutters.

The spiral of all ordinary mills is given an angle of 12 degrees. This angle has been found to produce very good results and to have no excessive end thrust. Mills for milling across the edge of very thin stock may be given a much greater angle, some having as high as 30 degrees. Mills for producing very fine surfaces are also given a greater angle than would be wise on the ordinary run of work.

TABLE IV.

DATA FOR USE IN CUTTING TEETH ON CUTTERS FROM ½" TO 6" DIAMETER.

			Setover of cutter.				Change gears for spiral head.			
Diam. cutter.	No. of teeth.	Included angle of cutter used.	½" side cutting radial face.	Other side cutting radial face.	Angle of spiral.	Pitch of spiral.	Gear on worm.	1st gear on stud.	2nd gear on stud.	Gear on screw.
½	6	80°	.05"	.232"	12°	7.4	64	48	40	72
¾	8	80°	.075"	.348"	12°	11.1	64	32	40	72
1	12	70°	.10"	.424"	12°	14.83	64	24	40	72
1¼	14	70°	.13"	.53"	12°	18.54	106	48	64	72
1½	16	65°	.15"	.60"	12°	22.25	64	24	40	58
2	18	65°	.2"	.80"	12°	29.65	86	32	44	40
2½	21	60°	.25"	.88"	12°	37.05	100	24	64	72
3	24	60°	.3"	1.11"	12°	44.22	44	24	40	24
3½	26	60°	.35"	1.295"	12°	51.9	100	28	64	44
4	28	60°	.4"	1.48"	12°	59.3	100	24	40	28
5	30	60°	.5"	1.85"	12°	74.1	100	24	86	48
6	32	60°	.6"	2.22"	12°	89.0	100	24	86	40

Table IV gives the pitch of the spiral to produce approximately 12 degrees and the change gears necessary to pro-

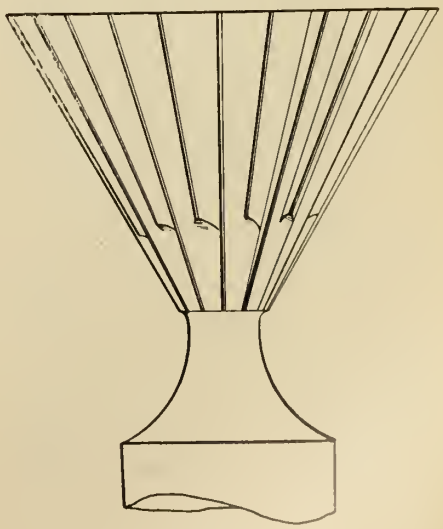

Fig. 15

duce the spiral on all standard spiral heads having a 40-tooth worm gear or

its equivalent. The lead of the spiral may be figured for any angle by the following method, figure 14: Lay out a line (A, B) equal to the circumference of the blank, which may be found by multiplying the diameter by 3.14; from one extremity (A) of this line draw at the required angle an oblique line; from the other end (B) of the line erect a line (B, C) at right angles to (A, B) intersecting the oblique line; the distance between the two intersecting points is the required lead of spiral. The angle of the spiral is always taken from the axis or centre line of the cutter blank.

In cutting the side teeth of a side-milling cutter the single angle cutter is the only style that can be used. The angle of the cutter is of a degree determined by the pitch and thickness of the siding mill, a thick mill having teeth cut much deeper than those of a thin one. When a cutter of this class cuts entirely on the side, the teeth should be made extra deep in order to have as much chip space as possible.

The method of finding the cutting angle for teeth of this kind was given in Article II, so that repetition will not be necessary. The end teeth on very small end mills are filed to shape. The same method applies also to the bevel and dove-tail cutters and small end mills. When the length of the cut on bevel and dovetail mills is of extreme length the teeth are made as in figure 15, the alternate tooth being cut out as it reaches the small end or neck of the cutter. This tooth is cut out by taking an extra trip around the cutter, setting the index to cut only half the number of teeth in the cutter or by indexing twice for each tooth cut out.

There is probably no branch of the metal-working tool business where so much is done by the "cut and try" method as in the cutter-making branch. It has until recently been in the experimental stages of their growth that other methods have not reached any point of perfection where they would prove practical. Cutter-making is essentially an experimental process at best, methods, design and material depending much on outside forces to such a degree that a standard is hard to adopt, but in any one class of work it ought to be comparatively easy to form some definite process and design to fully answer the requirements of the work in hand.

Experience will teach a great deal in this as in other branches of the machinery world, if not more. Failures, they say, are our best masters, but care must be used not to have failure master us.

Set your stake, and when you reach it, set it further ahead.

FOUNDRY SPECIALTIES.

At the recent foundrymen's convention in Cleveland, among the many useful and valuable souvenirs given away, the trick match box supplied by the E. C. Mills Oil Co., created the most interest. The firm was represented six strong and gave away during the days of the convention $1,200 worth of these souvenirs. One feature of this firm's work is the demonstrating and putting into successful and economical operation their goods in foundries throughout the country, by anyone of their fourteen traveling men, and this at their own expense.

The firm is represented in Canada by the Dominion Foundry Supply Co., with G. H. Weaver as manager, which firm have recently opened a branch office in Toronto where the interests of the firm will be looked after by Mr. Gafney.

SELLING MAGAZINE.

"Selling Magazine" is a new monthly periodical, the first number having appeared in May, 1906, published by Emerson P. Harris, Postal Telegraph building, New York. This magazine is devoted to methods of marketing machinery, tools, equipment and supplies in the most economical and satisfactory way. Articles on this subject by men of wide experience in publicity departments of large concerns and by prominent advertising agents, are published. This style of matter forms the backbone of the reading columns, and thus the paper should prove of considerable value to all interested in the selling of goods of a mechanical nature.

The cover design is attractive and the quality of the paper used is excellent. The style of make-up is two column, narrow measure. Undoubtedly this paper has an excellent future before it.

THE ILLUMINATING ENGINEER.

The Illuminating Engineer is a new monthly periodical, published by the Illuminating Engineer Publishing Co., 25 Broad street, New York, devoted to all kinds of illuminating. The cover is quite attractive and very suggestive, representing the lighting conditions of 100 years ago. The paper is of the best quality, allowing high grade printing and illustrating. The make-up is in two columns 2 1-4 inches wide.

A periodical of this kind has undoubtedly a very broad field, practically uncentered up to the present time, and thus this paper should have a good future.

PERSONAL MENTION.

The firm of Wayland Williams & Dadson, machinery dealers and manufacturers' agents, Montreal, have dissolved partnership and the business will be continued by A. T. Dadson.

* * *

Chas. G. Williams, who represents the Max Erffurt Sizing System in North America, with headquarters at Montreal, spent a part of May and June in Ontario and the Central States on a business trip.

* * *

J. A. Beattie, who has for some time been with Ross & Holgate, consulting engineers, Montreal, has left for Copper Cliff to superintend construction work there for the Dominion Engineering & Construction Co., Montreal.

* * *

Dr. Schuyler Skaats Wheeler, president of the Crocker-Wheeler Co., Ampere, N.J., sailed June 14 on the Lloyd steamship "Barbarossa," for a short European trip. He was accompanied by Prof. Francis B. Crocker, Professor of Electrical Engineering at Columbia University, who has been associated with him in business for many years.

* * *

Mr. J. C. Royce, S.B., mechanical and electrical engineer, has opened an office in Toronto. He is a graduate of the Massachusetts Institute of Technology, Boston, and has had seven years' practical experience with some of the largest manufacturing concerns in the United States, including the steel works in Pittsburg and Indianapolis, and the Baldwin Locomotive Works in Philadelphia, where he was engaged on the engineering staff for over two years. In Canada he was engaged as engineer to complete the construction and installation of the plant of the Northern Iron & Steel Co., the open hearth furnaces and gas producers being specially designed by him.

Mr. Royce has devoted considerable time to gas producer plants and the equipment of electric railway power plants. He has visited Germany and England where a very thorough experimental work upon producer gas plants has been conducted until the plants are now beyond the experimental stage. He is in touch with manufacturers and general conditions of the market there as well as in the United States, where he was sent quite recently to investigate some new plants. Mr. Royce's specialties are the design, supervision and construction of gas power plants, steam power plants for electric lighting, factories and railroads and open hearth steel plants.

Companies Incorporated

The Rheaume Foundry Co., Limited, Montreal; capital, $45.000; purpose, to carry on a foundry business.

The Moose Jaw Machine Works Company has been organized with a capital of $50,000. They will manufacture threshing engines, gasoline engines and machinery.

A new mining company to develop the Atikokan iron mines has been formed at Duluth. Dr. McKenzie, A. Snyder, H. L. Cruso, and A. Mills, of Duluth, are at the head of it.

McLachlin Bros., Limited, Arnprior, Ont.; capital, $2,000,000; purpose, to carry on lumbering business. Directors are: J. S. Lovell Wm. Bain, Robt. Gowans, E. W. McNeill and W. F. Ralph, all of Toronto.

The Amalgamated Oil Co., of Canada, Limited, London, Ont.; capital, $1,000.-000; purpose, to bore or drill for crude oil, etc. Directors are: C. B. Keenleyside, B. V. Hole, A. Keenleyside and W. D. Edy, all of London, Ont.

The Crown Lumber Co., Limited, Ottawa; capital, $20,000; purpose, to deal in timber and timber lands, and to erect saw mills, planing mills, etc. The directors are: T. Brethour, Jas. Thomas, W. D. Morris, R. G. Code, all of Ottawa.

Morse Hardware & Lumber Co., Limited, Swan River, Man.; capital, $100,000; purpose, to carry on a general lumber, manufacturing and contracting business. Directors are: H. V. Morse, J. T. Douglas, and S. G. Sanford, all of Swan River.

The Dashwood Planing Mill Co., Limited, Dashwood, Ont.; capital, $30,-000; purpose, to conduct a general planing mill and wood working business. Directors are: R. S. Hamilton, Geo. Kellermann, Geo. Koch, E. Otterbbine and J. Kellermann.

Canada Spool & Bobbin Co., Limited, Walkerton, Ont.; capital, $30,000; purpose, to manufacture and deal in spools, bobbins, wood turning, etc. Directors are: W. M. Shaw, J. W. Harcourt, J. H. Scott and T. E. Attwood, all of Walkerton, and J. R. Shaw, of Toronto.

The Jenkins Automatic Fender Co., Toronto; capital, $50,000; purpose, to manufacture and sell electric railway attachments and appliances, including the Jenkins automatic fender. Directors are: John Hallam, B. B. Jenkins, J. H. M. Jenkins, J. P. White and S. Hallam.

The Ontario Iron & Steel Company has been incorporated under Ontario charter with a share capital of $500,000 for the purpose of manufacturing, smelting and dealing in iron, steel and other metals. The provisional directors are David Muhlfelder, Joseph L. Steefel and W. M. German, with head office at Toronto.

The Geo. Long Co., Limited, Sherbrooke, Que.; capital, $90,000; purpose, to carry on the business of contractors and builders, furniture manufacturers and lumber dealers, etc. Directors are: Geo. Long, T. Long, M. V. Long, J. H. Bryce and Wm. Morris, all of Sherbrooke.

The Rainy River Navigation Co., Limited, Kenora, Ont.; capital, $40,000; purpose, to carry on general steamship business and to build steam boats. Directors are: G. A. Graham, J. T. Horne, Fort William; W. Ross, Kenora, Ont.; J. C. Graham, Winnipeg; A. R. Bartlet, Windsor.

The Empire Mfg. Co., Limited, London; capital, $100,000; purpose, to manufacture and sell metal goods, including plumbers', steamfitters' and engineers' supplies. Directors are: T. A. Stevens, Geo. Trundell, Geo. Reed, C. H. Ivey, J. C. Duffield, W. M. Gartshore and John Dromgole, all of London.

The Canadian Wire Screen Manufacturing Company has been incorporated under Ontario charter with a capital stock of $250,000 for the purpose of manufacturing wire roller window screens. The provisional directors are G. B. Meadows, H. G. Hopkirk, F. A. Mansell, M. C. Mowry and A. T. Blackwell, with head office at Toronto.

The Dominion District Steam Heating Company has been incorporated under Ontario charter with a capital stock of $100,000 for the purpose of manufacturing lighting and heating apparatus and appliances. The provisional directors are W. E. Warburton, W. Seccombe, G. E. Bradshaw, H. L. Dunn and J. W. McDonald, with head office at Toronto.

W. E. Dillon Company have been incorporated under Ontario charter with a share capital of $40,000 for the purpose of manufacturing and dealing in sheet metal goods, heating and fireproofing appliances. The provisional directors are W. E. Dillon, Daniel Batiste and Thomas Frampton, with head office at Toronto.

The Superior Portland Cement Railway Company has been incorporated under Ontario charter with a share capital of $50,000 for the purpose of constructing an electric railroad from their works to an adjoining lake. The provisional directors are George McIntyre, D. B. Brown, G. E. Brown, W. H. Jackson and W. DeL. Wilson, with head office at Orangeville, Ont.

The Electric Heaters have been incorporated under Dominion charter with a capital stock of $100,000 for the purpose of manufacturing and dealing in apparatus for use in generating heat and light. The provisional directors are A. F. Leggatt, W. L. P. Smith, C. H. Stapeldon, C. L. Bishop and A. A. Sears, with chief place of business at Ottawa.

The Toronto & Belleville Rolling Mills have been incorporated under Dominion charter with a capital stock of $599,900 for the purpose of taking over the interests of the Iron & Steel Co. of Canada and carrying on the manufacture of iron and steel. The provisional directors are W. D. Morris, Henry Nicholson, G. E. Barber, R. G. Code and E. F. Burritt, with chief place of business at Belleville.

The Morse Hardware & Lumber Co. have been incorporated under Dominion charter with a capital stock of $100,000, for the purpose of conducting a wholesale and retail hardware and lumber business. The provisional directors are H. V. Morse, J. T. Douglass, Elise Morse, Martha Ellen Douglass and S. G. Sanford, with chief place of business at Swan River.

The Great Lakes Portland Cement Company have been chartered to manufacture cement at Port Colborne, Ont. The capitalization is $1,000,000 and the promoters claim it will be the largest cement industry in Canada. Work will soon be begun on a plant that will have an output of 1,500 barrels a day, which is three hundred barrels in excess of the largest cement industry at present in operation in Canada.

Monteith-Nixon is the name of a company incorporated under Ontario charter with a share capital of $50,000 for the purpose of manufacturing and dealing in windmills, wind-engines, pumps, tanks, etc. The provisional directors are F. W. Monteith, R. B. Nixon, W. S. Monteith, Mary Maud Monteith and Winifred S. Nixon, with head office at Toronto.

The Klondike Water Supply Co., Dawson, Yukon Territory; capital, $6,000,-000; purpose, to install a system of works to convey water from the Klondike River to the different mining districts in order that mining may be carried on by the hydraulic methods. The directors are: A. McDonald, Wm. Barrett, A. B. Palmer, Dawson; R. Kelly, Vancouver; and A. E. Hitchcock, London, Eng.

Another Central Heating Plant.

A row of flats are to be built in Toronto by E. E. Sheppard to affect the old Mexican Mission House style. The buildings will be plain and simple in outline, being built of granolithic concrete. The internal design and plan of rooms are also simple, and economical of space and material, there being no partitions between the rooms in each flat, which will be merely curtained off as were the rooms in the old Mexican dwellings.

The lighting, heating and other arrangements are similar to those in other apartment houses, all coming from a central plant.

INDUSTRIAL PROGRESS

MACHINERY AND MANUFACTURING NEWS would be pleased to receive from any authoritative source industrial news of any sort, the formation or incorporation of companies, establishment or enlargement of mills, factories or foundries, railway or mining news, etc. All such correspondence will be treated as confidential when desired.

A mica factory will be erected at Hull, Que.

George Green will build a sawmill at Carleton, N.B.

Rosthern, Sask., will install an acetylene gas plant.

The Dominion Bridge Co. will erect a plant at Winnipeg.

J. A. Humble will build a saw mill at Cross Creek, N.B.

Richmond, Que., will expend $25,000 on a waterworks plant.

Saskatoon has purchased four acres for a power plant site.

The Canada Furniture Co., Walkerton, will enlarge their premises.

Ottawa will spend $100,000 in extending its waterworks system.

The Smart Bag Company, of Montreal, will erect a $50,000 factory.

C. W. N. Kennedy, of Winnipeg, will build a $75,000 business block.

The McLaughlin Carriage Works will build a warehouse at Calgary.

W. H. Gardiner is equipping a sash and door factory at Edmonton.

Elora ratepayers carried a by-law to lend $3,500 to a furniture concern.

The Dominion Textile Company will build a $50,000 factory at Montreal.

The Peterborough Show Case Company will erect a new factory in that city.

The Saskatchewan Government will erect a $200,000 steel bridge at Battleford.

The British-American Brewing Co. are erecting a bottling works at Essex, Ont.

The Alberta Pacific Elevator Co. will erect a 500,000 bushel elevator at Calgary.

J. P. Hall, of Willow City, N.D., will establish a soap factory at Saskatoon, Sask.

The Berlin Robe and Clothing Co. will build a three-story addition to their factory.

Port Hope electors will vote on borrowing $7,400 for a lighting system on July 4.

Middlesex County Council will build a new bridge at Sylvan, Ont., to cost $10,000.

A knitting factory is proposed for Ingersoll, Ont. $10,000 will be expended.

The zinc smelter at Frank, B.C., will be in operation soon. Thos. Jones is manager.

The Canada Leather Co., at Verdun, Que., was damaged by fire to the extent of $3,000.

Chatham ratepayers will vote on the loaning of $75,000 to the Keystone Sugar Co.

W. A. Preston, of Fort Frances, Ont., and others, will build a pulp mill at that town.

The Ham & Nott Manufacturing Co., Brantford, will make large extensions to their plant.

The average daily output of the Dominian Coal Company's mines is now 14,000 tons.

Barrie ratepayers carried a by-law to vote $27,000 to enlarge their water-power plant.

Plans have been prepared for the Edmonton legislative buildings. They will cost $400,000.

The Glengarry Mills Company, of Alexandria, will build an elevator and chopping mill.

The Ottawa Furnace & Foundry Company's plant is being offered for sale by the liquidators.

Kingston ratepayers carried their by-law to raise $85,000 to improve their lighting system.

A company known as the Jackson Visible Typewriter Co. will establish a plant at Hamilton.

The Fowlers' Canadian Co., Hamilton, will increase their factory premises by a $10,000 addition.

Quance Bros., Delhi, Ont., ask for tenders for a concrete dam and power house at that place.

The Minister of the Interior has ordered an investigation of the iron ore resources of Canada.

The Canadian White Company, of Montreal, have the contract for Walker's new theatre, Winnipeg.

The Chapman Ball-Bearing Co. have purchased land on Sorauran ave., Toronto, for a new plant.

The Quatsino Power & Pulp Co. will erect a $200,000 pulp mill on the north end of Vancouver Island.

The Canada Flax & Fibre Co., of Montreal, will build a flax mill and elevator at Milestone, Sask.

The Canada Carriage Co. will erect a three-storey addition to their works at Brockville, to cost $20,000.

The Brandon, Saskatchewan & Hudson Bay Railway will build a new station at Brandon to cost $30,000.

The Western Systems Company has been organized to manufacture loose leaf systems, office books, etc.

The Brantford Screw Works have decided to remain in that city and will erect a large plant on a new site.

Telford & Co., bankers, of Owen Sound, have sold their business to the Sovereign Bank of Canada.

E. F. Hutchings, of Winnipeg, and others will establish a harness factory at Portage la Prairie, Man.

Victoria, B.C., fire department is considering a proposal to equip its fire engines with electric motors.

The Jones Co., manufacturers of office fittings. Toronto, purpose starting a branch factory in Winnipeg.

The Yale Columbia Lumber Company had their works at Nakusp, B.C., destroyed by fire. Loss $22,000.

The Brandon Machine Works Company will build an office and wareroom building at Brandon to cost $16,000.

The earnings of the Lake Superior Corporation for the year ending June 30 next will amount to $5,200,000.

Fort William ratepayers have approved a by-law to raise $125,000 to bring water from Loch Lamond.

British Columbia lead production during 1905 amounted to over fifty-six million pounds, valued at $1,971,818.

A. J. Mulvey, of Stillwater, Minn., is at the head of a company who will build sawmills near the G.T.P. terminus.

The Ontario Iron and Steel Co. have concluded the purchase of 60 acres of land at Welland for their new plant.

The International Electric Company have asked Chatham for a loan of $20,000 to establish a new plant there.

The Gillies hotel syndicate have decided to build a hotel and theatre building in Vancouver, costing $300,000.

J. P. McArthur, of Winnipeg, has formed a million dollar company to engage in railway contracting business.

The Adams Wagon Works, of Brantford, will increase their factory and plant to handle increasing business.

The Hamilton Plate & Mirror Glass Company will go into the manufacture of plate glass and mirrors in Hamilton.

The Automatic Telephone Company will erect a factory at Brantford for the manufacture of telephone supplies.

The Ogilvie Flour Mills Co., will erect a million bushel elevator at Fort William as soon as the old one has been removed.

The Smart Bag Co. are building a factory 125 x 75 feet on Mullins street, Montreal. The structure will cost $50,000.

E. Cowper Thwaite, of London, Eng., has purchased the Mallery mineral claims on Howe Sound, B.C., for $250,000.

The Canadian Mine & Smelter Supply Company intend establishing a plant in Victoria to manufacture mining machinery.

The Berg Manufacturing Company contemplate manufacturing sand lime bricks and machines for making same in Brantford.

The Norton System Telephone Company are negotiating with Peterborough with a view to establishing a factory there.

The commercial travelers of Manitoba have joined the Dakota and Minnesota

travelers in convention at Albert Lea, Minn.

The Pacific Coal Co. has ordered two 150 h.p. boilers from the Robb Engineering Co. for their mine at Bankhead, Alberta.

The London Cement Brick Machine Manufacturing Co. will build a large brick factory to accommodate their works.

Halifax men have purchased the Dartmouth Electric Light, Heat & Power Company, and will extend and improve its service.

The Dominion Steel Co. and the Soo Company are said to have enough orders on hand to keep them going for two years.

The Northern Iron Works, Winnipeg, have purchased 25 acres in the suburbs of that city upon which they will erect a new plant.

The Bank of Ottawa, Parry Sound, offers for sale 67 square miles of timber limit on the Georgian Bay with a new mill upon it.

The Canadian Westinghouse Electric Co. have the contract for machinery for lighting the new Traders' Bank building, Toronto.

Sir Thomas Shaughnessy has announced that Windsor Station, Montreal, will be increased to four times its present capacity.

Electricity, which has in many cases been a source of profit to the mines of the Canadian west, is being utilized still more extensively.

The Malleable Iron Company, of Amherst, N.S., will commence building their new plant at once. It will be of brick, 300 by 75 feet.

The Grand River & Western Power Co., of Brantford, are seeking incorporation with a view to generate power from the Grand River.

G. W. Archibald & Co., Winnipeg, have the contract for the mill for the Maple Leaf Milling Co., at Kenora, Ont. The price is $200,000.

The Bachus-Brooks Co., Minneapolis, have purchased the limits of the Keewatin Lumber Co. in Northern Ontario and will erect large mills.

The Logan Tanning Co. are improving the steam plant at their tannery, Pictou, N.S., and will install a 150 h.p. Robb-Armstrong Corliss engine.

The Dominion Steel Co. received $674,800 in bounties last year. The Algoma Steel Co. received $404,900 and the Nova Scotia Steel Co., $125,768.

The Ontario Public Works Department calls for tenders for additions to the chemical building and the greenhouses at Guelph Agricultural College.

The Western Iron Works have opened up a new factory at Elmwood, Winnipeg, for the manufacture of ornamental and architectural iron work.

George Townsend, of Chicago, has the contract for building the Hamilton, Ancaster & Brantford Electric Railway. Work will be commenced shortly.

In a 24-hour run the rail mill at the "Soo" has just turned out 859 tons, a few tons above the record run recently made by the Dominion Steel Co.

The United States Steel Co., which it is understood purposes erecting a million dollar plant near Sandwich, Ont., have paid over $17,000 cash for the land.

The Dominion Textile Co., Montreal, have taken out a permit to build a seven-storey factory, at a cost of $50,000, on St. Ambroise street, Ste. Cunegonde.

The Ontario Iron & Steel Company are making preparations for the erection of their new plant at Welland, and have a large quantity of material on the ground.

A meeting of the directors of the Dominion Iron and Steel Co. has been called for June 6th, when, it is understood, reorganization plans will be discussed.

The Canadian Westinghouse Co. have just completed the largest generator manufactured in Canada. It is for the British Columbia Electric Railway Co. of Vancouver.

The Diamond Flint Glass Company are about ready to commence work. About twenty tons of composition will be treated daily, with an output of 1,200 dozen bottles.

N. J. Holden & Co., Canadian sales agents for the Chicago Pneumatic Tool Co., have moved their Toronto office from the Temple Building to 42 York street, Toronto.

Woodstock council and board of trade sent a committee to Detroit to examine an iron working industry that desires establishing a Canadian branch. They reported favorably.

The coal and steel companies of Cape Breton are suffering from a scarcity of labor and their output threatens to be materially reduced this year if conditions are not improved.

American capitalists have been negotiating with Hamilton for some time with a view to establishing a carpet factory there, and it is said arrangements are completed.

Port Elgin will instal a waterworks system at a cost of $30,000, and have guaranteed a loan of $10,000 to Stephens, Hepner & Co. for additions to their brush factory.

The Canadian McVicar Engine Co. will establish a plant in Galt to make gas and gasoline engines. A. W. Wright, president of the American Abel Co., is president of this company.

The Canadian Westinghouse Co. have secured a contract to supply the Montreal Street Railway Co. with equipment to cost $130,000. Fifty sets of air brakes are included in the order.

Fredricton, N.B., council have about decided to purchase a boiler from Robb Co., of Amherst, and a hundred horsepower engine from Goldie & McCulloch, of Galt, for their lighting plant.

The Canadian Pacific Railway Co. have ordered one thousand additional box-cars from the Angus shops. Contracts on box-cars now under way in these shops aggregate $2,000,000.

The Central Foundry Co. will commence at once to fit up buildings in Port Hope for their new plant. They will install machinery to the cost of $75,000, and employ 25 men the first year.

B. W. Snow, the Chicago crop expert, says Canadian crop conditions were never more perfect than at the present time. The increase in the entire Canadian wheat acreage is 10 per cent.

Preparations are being made to start the Belleville rolling mills. Cars of scrap and sortings are on the way. The new company will be known as the Toronto & Belleville Rolling Mills Co.

The Consolidated Electric Co., Limited, 710 Yonge street, Toronto, are installing a number of the King Edward motors in the press room of the Murray Printing Co., Jordan street, Toronto.

The Canadian Fairbanks Co., Montreal, have been awarded the contract for a Fairbanks-Morse 21 h.p. suction gas producing plant, being installed by the W. H. Comstock Co., Brockville, Ont.

The Montreal Street Railway Co. have recently installed a new 1,000 k.w. Westinghouse generator, three 500 k.w. Westinghouse motor-generator sets, and 50 sets of the Westinghouse air brakes for new cars.

The Ontario Government has accepted J. R. Booth's tender for a pulpwood area near Montreal River. He pays a bonus of $300,000, and 40 cents a cord for spruce cut, and 20 cents a cord for all other woods.

The Brown Alaska Mining Co., Vancouver, B.C., have just received from the Jenckes Machine Co., Sherbrooke, Que., a 100 h.p. tubular boiler, the order for same having been placed with the Vancouver office of the company.

The by-law to give the Canadian Iron & Foundry Company a $20,000 site for the car wheel works was carried at Fort William and work will be commenced at once on a plant that will produce 75 tons of finished product a day.

The Canadian Metal Company's smelter at Frank, Alta., has been completed and is now producing and shipping zinc. This is the first smelter of its class in the Dominion and it should prove to be a great boon to the Canadian market.

The "Model Library," sold by Spon & Chamberlin, New York, consisting of four 25c. books—Electricity, Dry Batteries, Electrical Gas Lighting, and Woodwork Joints—has proven to be very popular in Canada and the United States.

The Rush Bay Golden Horn Mining Co., Rat Portage, Ont., recently purchased from Allis-Chalmers-Bullock, Limited, Montreal, a mining plant, including a Huntington mill, two Overstrom concentrators, and the accessory machinery.

Excavation work has begun on the site for the new Guarantee Company of North America building on St. James street, Montreal. C. E. Deakin is the general contractor, and the fireproofing

will be done by the Roebling Construction Co. of Buffalo.

A Glace Bay despatch says the Dominion Coal Company now have ten mines producing. Total shipments for the month were 330,015 tons. If sufficient labor can be procured the June output is expected to be the largest in the history of the company.

The London, Eng., Standard's New York correspondent says that the Steel Trust will not erect its proposed plant in Canada in 1906 but has options on land at Hamilton and Collingwood. This is incorrect as no such options are held by the U. S. Steel Corporation.

The output of the collieries of the Nova Scotia Steel & Coal Company for May reached a total of 59,289 tons, an increase over the corresponding month last year of 21,036 tons, and the largest in the history of the company for one month, except November, 1905.

The new machine shop of the West Allis Works extension of the Allis-Chalmers Co., which is to be devoted entirely to steam turbines, is now nearing completion, and the second installment of orders for new machine tools covers a wide range of machine tool builders in the States.

The Peterborough Cereal Co. have just installed a large gas producer plant in their works at Peterborough. In future Canada Flakes will be toasted by gas produced in the power plant of the company. This is the first producer plant to be installed in Canada to be used for this purpose.

The Blanchite Process Paint Company has been incorporated under Ontario charter with a capital stock of $250,000 for the purpose of manufacturing paints, varnishes, etc. The provisional directors are J. C. B. Blanch, O. C. Arlitz, B. M. Armstrong, J. E. Askwith and Andrew Haydon, with head office in Toronto.

The Transcontinental Railway Commission has received four tenders for 65,000 tons of steel rails. Two tenders were from the Canadian plants at Sydney and the Soo, one was American and the fourth English. It is likely the contract will be divided between the Canadians.

The Jenckes Machine Co. have recently shipped to the Alberta Portland Cement Co., Calgary, a complete hoisting plant consisting of 40 h.p. locomotive boiler and 7 x 10 hoisting engine, together with hoisting rope, steam piping, etc. The order was placed with the company's Rossland office.

The Rheaume Foundry Company have been incorporated under Dominion charter with a capital stock of $49,000, for the purpose of carrying on the business of founders in all metals. The provisional directors are Jeremie Rheaume, J. L. Rheaume, Valere Rheaume, Donatien Rheaume, and A. L. Rinfret, with chief place of business at Montreal.

The Canadian Consolidated Mines at Trail, B.C., are now using a Westinghouse electric locomotive for hauling cars to and from the mines, as well as three Westinghouse 1,250 k.w. transformers. The company find that the use of electricity for power and haulage increases the output of the mines, and actually decreases the operating expenses.

The Catholic School Board, of Montreal, have decided to purchase a lot on Haymarket square, for the purpose of erecting two schools for the parish of St. Helen. The construction of a school for boys will be undertaken at once, but the erection of the other, which is to be a girls' school, will be deferred until next Spring.

The West Kootenay Power & Light Co., Rossland, B.C., are adding to their equipment 6 step-up transformers, each of 1,875 k.w. capacity, to transform from 2,200 volts to 60,000 volts, and 6 step-down transformers each of 1,250 k.w. capacity, to transform from 60,000 volts to 2,200 and 440 volts. The consulting engineers are Ross & Holgate, Montreal.

I. Matheson & Co., Limited, New Glasgow, N.S., manufacturers of mining machinery and engines and boilers, have secured the exclusive right of manufacture in Canada of the Capell mine ventilating fan. The inventor of this fan is Mr. G. M. Capell, England, and the fan has an excellent reputation in England. I. Matheson & Co. are also getting up a splendid design of engine for direct connection to this fan.

A large Canadian syndicate has recently been formed in Mexico, the capital interested being chiefly that interested in the Mexican Light & Power Co., and has purchased the tramway service of Mexico City, and the tramway service and lighting service of City of Puebla. This syndicate is now building power houses on the Necaxa and Tenango Rivers, from where transmission lines will be run to surrounding cities and towns.

The A. R. Williams Co., Toronto, are looking for a site for a branch warehouse at Vancouver. The A. R. Williams Co. was started when Mr. Williams retired from the firm of Thompson & Williams, farm implement and threshing machine manufacturers, Stratford, Ont., and has since absorbed the Soho Machine Works, the Brantford Hollinrake Co., and the London Tool Works, besides smaller concerns.

The works of the Vancouver Fire Clay Co. at Matsqui, on the south side of the Fraser River, near Mission, have been completed so far that they will be put in operation at once. The production of fire brick, fire clay, sewer pipe, farm drain tile, etc., will be included in the enterprise. All local capital and local parties are interested in the project and as the very best quality of rock deposits has been secured in large quantities a permanent industry of great value is assured.

A Winnipeg despatch announces the turning on of the power at the Winnipeg Electric Street Railway Company's great plant on Pinnawa Channel, Winnipeg River. The plant is located 60 miles from the city, and is capable of developing 10,000 horse-power, which will be transmitted to Winnipeg for the company's street railway system, lighting, manufacturing purposes, and will enable them to practically cut their former charges in half.

Mr. Plummer's view that the Canadian market will not be able to take all the rails manufactured does not exactly agree with the more optimistic ideas held in other quarters. A man who is in close touch with steel rail conditions in Canada expressed the opinion that if the Sydney and Soo plants turned out 400,000 tons a year Canada would be able to take the whole business for at least three years to come. At the same time, if the Dominion Steel people find a foreign market it will be a good thing. The plant is in an ideal position, geographically, for export trade.

The Rossland office of the Jenckes Machine Co., Sherbrooke, Que., has closed a contract with the Dominion Copper Co., Boundary Falls, B.C., for one of their 42 x 30 Farrel Bacon ore crushers, also for a 10 x 16 crusher of the same pattern. The capacity of the larger machine is 1,500 ton to 6-inch cube in a day of ten hours, and the shipping weight is 125,000 lbs. It is the largest pattern jaw crusher so far built anywhere. Several of these crushers have been put in use by the Granby smelter, of Phoenix, within the past three years.

The Williams Gauge Co., of Pittsburg, Pa., have opened a Canadian branch office in the Temple Building, Montreal, with Wm. N. Courtenay in charge. This firm are among the pioneer manufacturers of safety feed-water regulators, steam pump governors, safety water columns, high-pressure steam traps, chain lever water gauges, rotating re-grinding gauge cocks, etc. Mr. Courtenay, who has represented the firm for a number of years in the United States, is well pleased with his prospects in this country.

Among the new buildings in Montreal on which operations have already begun are the Linton Apartment, the Montreal Light, Heat & Power Co's building, and the new Grand Trunk office building on McGill street. The latter will be a ten storey building covering nearly 10,000 square feet, and it will be constructed so that if the by-law of the City of Montreal limiting the height of buildings is altered at any time, more storeys can be added. The material to be used in the building of the structure will be a granite base with either stone or glazed terra cotta for upper storeys.

The plant of the Hall Mines Smelter at Nelson has been greatly increased and improved, and further extensions are contemplated. Recent increases in the market value of silver and lead have urged on the construction, which the growth and prosperity of the mining industry in the Nelson district has been making necessary for some time. The improvements include two additional furnaces with joint capacity for 200 tons lead ore daily; one new Heberlein roaster, now being constructed, six Heberlein convertors and an ore crusher and sampling mill. Another Heberlein roaster and six more convertors are projected. Various other improvements and additions have been made, the total expenditure on the plant being about $100,000 when construction is complete.

Among the recent orders for boilers

secured by the Jenckes Machine Co., Toronto, to be built at the St. Catharines works of the company, are the following: Three 70 h.p. 60 in. by 14 ft. high pressure, tubular boilers for Adam Clarke, Hamilton; one 60 h.p. 54 in. by 12 ft. boiler for Dominion Radiator Co., Toronto; one 40 h.p. 44 in. by 12 ft. tubular boiler for the Superior Brewing Co., Port Arthur, Ont.; one 70 h.p. 60 in. by 14 ft. high pressure tubular boiler, one 25 h.p. 42 in. x 10 ft. tubular boiler and one 50 h.p. locomotive type boiler for the Stuart Machinery Co., Limited, Winnipeg, and one 45 h.p. 48 in. by 14 ft. horizontal tubular boiler for Stevenson & Malcolm Co., Guelph, Ont.

British Columbia may look forward to the development of the pulp industry in extensive proportions shortly, the news having been received from London of the successful flotation of the company which is to take over the Quatsino Sound Pulp Co's holdings on the northwest coast of Vancouver Island. The Oriental Pulp Co., which has its limits on the mainland some distance further north, is also getting in shape for rapid construction of a mill. Both propositions are to be for making sulphite pulp. The enormous spruce timber areas of the northern coast districts of the province have long been looked on as the next source of supply for pulp, and with the extension of shipping facilities the field is opening rapidly for the disposal of the product on a large scale.

The application of electricity to mining, especially where water power is available, is recognized as a handy and economical method of operation. Among recent sales for this purpose by Allis-Chalmers-Bullock, Limited, Montreal, were a 60 h.p. induction motor to drive a two-stage centrifugal pump, and a 50 h.p. induction motor to drive a six-stage centrifugal pump, with the necessary transformers, etc., to the Dominion Copper Co., of Phoenix, B.C.; one 900 h.p., two 300 h.p., one 50 h.p., and one 25 h.p. induction motor for general work, and a 40 h.p. induction motor to drive a two-stage centrifugal pump, to the Asbestos & Asbestic Co., of Danville, Que.; and a 75 h.p. induction motor driving a compound air compressor for general power purposes, and a 115 k.w. generator for lighting purposes, to Blackburn Bros., for their mica mines at Perkins Mills, Que.

L. L. Anthes Elected.

The annual joint convention of the American Foundrymen's Association and the Associated Foundry Foremen was held at Cleveland last week. Wm. H. McFadden, of Pittsburg, was elected president of the Foundrymen's Association, and L. L. Anthes, of Toronto, one of eight vice-presidents.

New Malleable Works.

Some time ago it was announced that Smith's Falls, Ont., was to have a new malleable iron works, but later it was rumored that it was not to be carried out. However, the shops of the company known as the Rideau Malleable & Foundry Co. are to be built at once and work on the foundation is now under way, so that before the snow flies a large number of men will be employed.

Dissolution of Partnership.

A change is announced in the business of Wayland Williams & Dadson and the partnership between Wayland Williams and A. T. Dadson dissolved by mutual consent on June 15. The business will be carried on by Mr. Dadson under the firm name with the same vigor and enterprise that has hitherto characterized this company.

Promoting Chemical Industry.

All interested in the concentration or evaporation of liquors of any kind will be interested in knowing that J. A. DeCew, chemical engineer of Montreal, is the Canadian representative of George Scott & Son, of London, England, who are the largest manufacturers of vacuum evaporators in the world. The firm makes special plants for the concentration of sugar solution, caustic soda solutions, gelatine solutions, soapmakers' waste lyes, fertilizer solutions, sulphate of ammonia liquors, etc., also special plants for the refining of glycerine, crystalizing and recovery. The plants are all English made, and come into Canada under the preference of 33 per cent. Although in common use in England, they are just being introduced into Canada, and their establishment on this side will be both a development of Imperial trade and home industry. Mr. DeCew will place his laboratory and other facilities at the free disposal of his customers, in order to assist them in obtaining the best designs and plants for their requirements.

Schofield-Holden Machine Co., Limited.

R. Schofield, maker of special machinery, 14 Court street, Toronto, and A. P. Holden, 105 Adelaide street, west, have amalgamated under the name of the Schofield-Holden Machine Co. Limited. They have purchased the plant of the Canada Launch & Engine Works, Carlaw avenue, Toronto, and that business will be continued. In addition, another machine shop is under construction on Carlaw avenue, and the machines from A. P. Holden's shop on Adelaide street will be moved to the new shop. The machine shop on Court street will, however, remain as it is, and the head office will be there. All the heavy work will be done at the Carlaw avenue shops, while the light work and work wanted immediately, will be done at Court street.

The class of work done by these two men is of excellent repute, not only in Canada, but also in the United States and England; and it is to be expected that the work turned out under the new conditions will, if anything, be better than before.

The Antiquity of Iron.

Nothing is known of the origin of the smelting and forging of iron. The oldest piece of iron known to be in existence was discovered wedged between two stones in the pyramid of Cheops, which was built about 3,000 B.C. A thousand years previous to the construction of this pyramid, an Egyptian king, the oldest monarch known to history, changed the course of the Nile by erecting dams of stone. The erection of these great dams without the use of iron and steel tools, and great numbers of workmen skilled in their use, would have been impossible, so that the working of iron antedates written history many centuries.

The first great advance in the manufacture of iron was the employment of an artificial air blast to maintain and regulate the fire. Sculpture on the walls of a tomb erected at Thebes 1,500 B.C., shows that the Egyptians utilized an artificial blast. The picture shows a conical vessel suspended over a fire, which was fanned by a bellows consisting of two leather bags with a clay pipe extending down to the fire for conveying the air. Standing upon the bags, the operator pressed each alternately, closing with his heel, the hole in the top of the bag for admitting the air. When the air was exhausted, the operator removed his foot and opened the air-hole by pulling a string.

Small Tool Plant in Operation.

The manufacturing of small tools has commenced at the Bertram Works, Dundas, where in future the Pratt & Whitney tools will be manufactured for the Canadian trade. All the latest automatic and up-to-date machine tools required for fine manufacture have been installed and the plant is running in full fling. Electric motor drive has been adopted. A brighter or more completely equipped shop will not be found anywhere in this country. Work is already under way on one of the new machine shops which will form a part of the general enlargement of the Bertram works. The building is to be of steel and brick, 245 feet 6 inches long by 54 feet wide, and 45 feet 6 inches high, and will form a portion of the new erecting shop. Two cranes will be installed, one 30 ton and one 10 ton, and in this building all heavy machines like planers and boring mills will be located. A railway track will run into the building at the east end. It is the intention to further add to this plant by a machine shop and a large erecting shop. This will necessitate the employ of many more men than at present employed in the plant.

The Dominion Henderson Bearings.

The reorganization committee of the Henderson Roller Bearing Co., Limited, have about completed their work and now operations have been resumed at the plant at 875 King street west, To-

ronto, under the firm name of Dominion Henderson Bearings, Limited. The officers of the new company are:

President, Mr. Bowman, Georgetown; vice-president, W. Ogden, Toronto; sec.-treas., J. F. Adams, Toronto.

The officers of the new company saw the necessity of putting the works under entirely new management, and were fortunate in securing the services of Mr. J. Dove-Smith as general manager.

The plant installed by the old management is exceptionally well equipped and is so large as to entirely exceed the requirements of the roller bearing business and thus the company are in a position to build high-class special machinery of any kind. At present the company are negotiating for a different plant, and when they have secured a suitable place, will start the manufacture of gasoline and gas engines and gas producers, always keeping the roller bearing as their chief product. At that time they will be in the market for a few additional machines, including a boring mill, a vertical miller and an air compressor.

The new company have received some valuable testimony as to the efficiency and durability of the Henderson bearing and this has strengthened their determination to advance the bearing as their chief article of manufacture.

OUR CONDENSED ADS. BRING QUICK RETURNS

Machine Shop for Sale

ON KING STREET, TORONTO

Most desirable premises on King St., near Sherbourne, Toronto; close to railway siding; convenient goods entrance; three floors and basement, containing 12,103 square feet floor space.

The following tools are in good condition:

1—Power Hack Saw.
1—8 H.P. Gasoline Engine (Walwrath).
1 Bench Emery Grinder.
1 Universal " (Brown & Sharpe).
1 30 x 30" Planer (Petrie).
1—Universal Milling Machine Bertram).
1—28" Spindle Emery Stand.
1—16" Shaper (McGregor & Gourlay).
1—14" Vertical Drill Belt Drive (A. R. Williams).
1—10" Barnes Friction Speed Drill.
1—24" Vertical Drill (A. R. Williams).
1— Champion Forge.
1— Gasoline "
1— Hand Press.
1— Screw "
1— Circular Saw, Table and Iron Frame (Petrie).
1— Band Saw.
1—40" Hollow Spindle Gap Lathe (McGregor & Gourlay).
1—14" " " Engine Lathe (Porter).
1 18 x 6" Hollow Spindle Lathe No. 5 (Bertram).
1 12 x 5" Barnes Engine Lathe No. 4.
1—16 x 10" Engine Lathe (McGregor & Gourlay).
1—20 x 14" Wood-turning Lathe.

We desire to sell these premises at an early date, and are willing to make reasonable sacrifice to prompt purchaser.

Write for full particulars.

RATES

One insertion—25c. for 20 words; 1c. a word for each additional word.

Yearly rate—$2.50 for twenty words or less, 10c a word for each additional word.

The above does not apply to notices under the head of "Machinery Wanted." These notices are inserted free for subscribers.

BUSINESS CHANCES

LOCATION WANTED—We are seeking a location for a steel stamping industry that will give employment to about 75 hands; owing to large demand for articles of this kind in Canada; we are desirous of locating there; what inducements can a progressive city offer? Address reply to The Crescent Machinery Co., 1,535 Williamson building Cleveland, Ohio. [6]

INDUCEMENTS SOUGHT—A firm employing over a hundred hands, would like to get full particulars of inducements offered by Canadian towns and cities to branch of reliable and well established concern. Reply to Manufacturer, c/o CANADIAN MACHINERY, Toronto. [6]

FOR SALE.

ONE hand fire hose reel, practically new; capacity, 2½ inches hose; reason for selling, have two hose wagons, require only one Apply to the Corporation of the Town of Magog, [7]

DYNAMO—Manufactured by the Canadian General Electric Co., Limited; Thompson-Houston system; patented 1893; Class "A1" 120, No. 1527; speed, 1,070 revls.; volts full load, 2,308; no load, 2,080. Apply to the Corporation of the town of Magog. [7]

MACHINERY FOR SALE.

BRICKMAKERS—Write us for particulars of our open air and exhaust steam dryers trucks, automatic cutting tables, disintegrators: we have the following second-hand machinery for sale, all in good repair: 1 steam power Quaker brick machine, 1 tumbling barrel for grinding bats into sand, second-hand 4x12 boiler, 16 h.p., stationary engines, slide valve. Bechtels, Waterloo, Ont. [7]

SAND LIME BRICK PLANT—H. W. Petrie is offering for immediate possession a modern plant, equipped throughout with best possible obtainable machinery for manufacturing sand lime brick; we have an interesting proposition for the right party that will stand looking into. Address H. W. Petrie, Toronto and Montreal. [7]

BOILER AND ENGINE—Twenty and fifteen horse power, for sale cheap. Bramm Bros, Berlin, Ont. [7]

PROPERTY FOR SALE

FACTORY site or subdividing property; 26 acres or 200 lots; in Industrial St. Catharines; clean, level, dry, square block; inside city; water and rail facilities; electric line passes property; cheap electric power and natural gas; exemptions; best labor conditions; bargain; W. B. Clark, trustee, Port Dalhousie, Ontario. [8]

FACTORY PREMISES FOR SALE—Near Toronto; four-storey solid brick; about five acres land; railway siding; outbuildings; engine, boiler; sacrifice for immediate sale. Apply, J. J. McKenney, 43 Victoria street, Toronto. [7]

ENGINEERING:

AN ILLUSTRATED WEEKLY JOURNAL

Edited by WILLIAM H. MAW and JAMES DREDGE

PRICE SIXPENCE.

"ENGINEERING," besides a great variety of Illustrated Articles relating to Civil, Mechanical, Electrical and Military Engineering and Notes of General Professional Interest, devotes a considerable space in each issue to the illustration and description of all matters connected with the PRACTICAL APPLICATION OF PHYSICAL SCIENCE, and with its Wide and Influential Circulation in all parts of the world, this Journal is an

UNRIVALLED MEDIUM FOR ADVERTISEMENTS

SUBSCRIPTIONS (Home, Foreign and Colonial)

"ENGINEERING" can be supplied, direct from the Publisher, post free for Twelve Months, at the following rates **payable in advance**:—

For the United Kingdom	£1 9 2
For all places abroad:—	
Thin Paper Copies	£1 16 0
Thick "	£2 0 6

Subscribers residing abroad are strongly recommended to order copies on thick paper, as the illustrations are necessarily very much less effective in the thin paper edition, and to remit, when possible, by Post Office Order made payable at Bedford Street, Strand, London, W.C. When Foreign Subscriptions are so forwarded, advice should be sent to the Publisher.

Foreign and Colonial Subscribers receiving Incomplete Copies through Newsagents are requested to communicate the fact to the Publisher, together with the Agent's Name and Address.

Cheques should be crossed "Union of London and Smiths Bank, Limited, Charing Cross Branch."

All accounts are payable to "ENGINEERING, LIMITED."

ADVERTISEMENTS.

Prepaid Advertisements on Wrapper, **classified** under headings: Tenders—Appointments Open—Situations Wanted—Partnerships—Wanted, &c.—For Sale—Auction Sales—Publications—Miscellaneous—Patent Agents—&c.

OF THE

"Engineering Times"

will be sent free of charge on receipt of a post card with Name and Address, with full particulars of our offer of presentation engineering volume to Annual Subscribers.

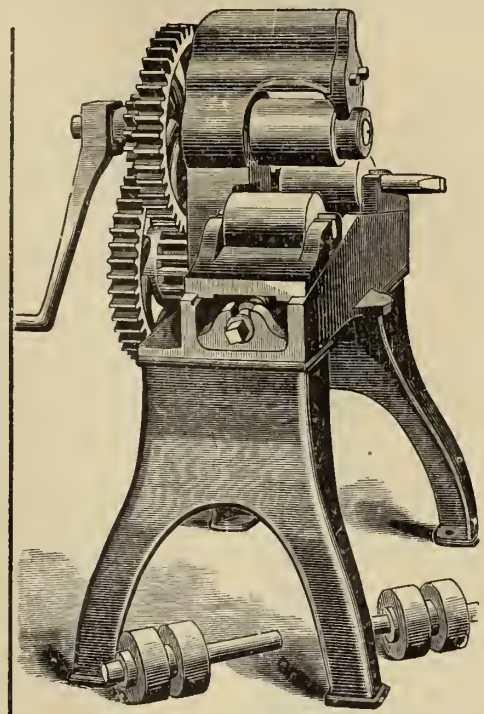
It is freely illustrated throughout with reproductions of Photographs, Drawings and Sketches.

Published every Thursday. Price, TWOPENCE
Annual Subscription, 10s. 10d.; Abroad, 13s.

THE PUBLISHER:

"ENGINEERING TIMES"

Orchard House,
2 and 4, Great Smith Street, S.W.
LONDON, ENG.



Our *No. 1 TIRE BENDER* is made with open side so that tires can be taken out without springing. The ends of tires coming through the rolls are sure to come together perfectly square. Grooved Rolls for bending iron edgewise furnished when ordered. Tight and loose pulleys fitted for power when desired. Will bend tires up to 7/8 in. thick by 5 wide.

SADLER & HAWORTH
The Best Selected Steer Hides, Tanned by Oak Tanning make the Leather that makes SADLER & HAWORTH BELTING.
Through thirty years of practical Belt Making, we have found out all the "whys" and "wherefores."
It is to our interest to make Good Belting, and we do it.
We do not want you to buy only One Belt. We want to supply you with All Your Belting.
Our Grades will always be found to be Uniform in Quality.
We aim to make Our Belts a little better than the best. A trial order will convince you that We Have Succeeded.

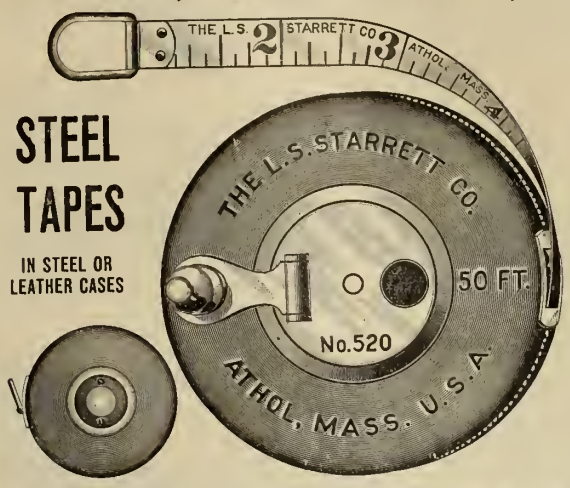
STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH



STEEL TAPES

IN STEEL OR LEATHER CASES

In our tapes the figures denoting feet are smaller than those denoting inches. Two reasons for this :

This dissimilarity of figures materially lessens (in fact ought to entirely prohibit) the liability to erroneous readings that frequently occur through the uniformity of all figures in steel tapes of other makers.

The smaller figures, denoting feet, allow the graduation line under each to be plainly visible, instead of being obliterated by the usual larger figure.

Graduated in feet, inches and eighths of an inch, or in feet, tenths and hundredths of a foot.

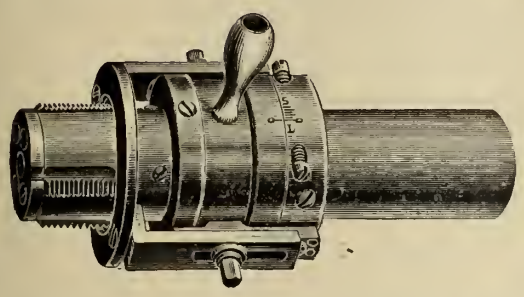
MODERN COST-REDUCING TOOLS

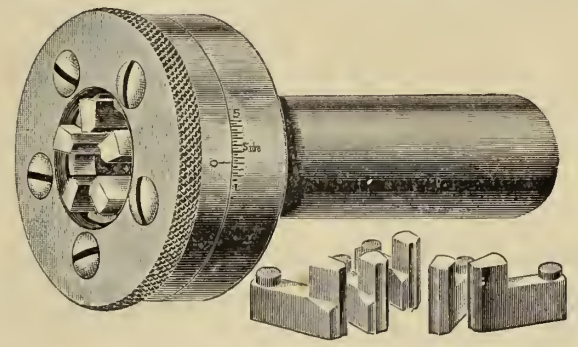
ADJUSTABLE COLLAPSING TAPS



These tools are so constructed that when hole is tapped to the depth desired chasers automatically recede and tap can be instantly withdrawn—no time wasted in "backing out;" no change or injury to thread or tap. Will save money wherever used. Apply it to your brass-finishing lathes, screw machines, any turret head machine or drill press—the saving will be well worth while.

ADJUSTABLE HOLLOW MILLING TOOLS

Accurate Diameters with a Single Cut



These tools will mill work of any length, work close to a shoulder, and can be adjusted to size instantly. Particularly adapted for brass finishing or other kinds of duplicate work on screw machines and hand turret lathes.

SELF-OPENING SCREW-CUTTING DIE HEADS

We make Style "D" Screw-cutting Die Heads for every variety of work, to cut right or left hand threads of any thread form, standard or special pitch. As the body of the tool is hollow, it will cut threads of any length.

Quick and accurate variations may be made in the diameter of threads for a tight or loose-fitting screw, as desired; and, as the dies are adjusted simultaneously, the greatest accuracy is assured. The dies are operated automatically by simply stopping the travel of the turret slide. All the objections to a solid die can be overcome by its use.

No. 1-14 Cutter and Reamer Grinder.

WE HAVE A FEW OF THESE MACHINES READY FOR IMMEDIATE DELIVREY

This machine is distinctly a cutter grinder, and was designed to fill the want for a machine to sharpen milling cutters of all kinds and shapes, without special fixtures or special-shape emery wheels, being heavy enough to eliminate all vibration and still be easily operated. It weighs about 1370 lbs. The table, which has a long bearing on the saddle, has a longitudinal feed of 20 in., cross adjustment of 7 in., with a vertical adjustment of 6 in. Cutters 1 in. to 14 in. can be taken between centres. The table can be used at different angles with the spindle in horizontal plane, by swiveling the knee around the column. The machine is compact, durable, adaptable and a necessity for the busy shop.

The Logic of Illustrating

The persuasive quality of advertising is practically doubled by an A1 illustration.—It impresses the possible customer with a definite idea of your product no word-picture could impart. *Vice-versa*, a poor illustration condemns your work at the outset. It's a positive sale-killer. Isn't it folly, therefore, to allow valuable space to carry a cut which is a libel on your goods? ℂ. The most extensive illustrating business in Canada has been built on the sound basis of high quality and a fair price, and—*it belongs to us.*

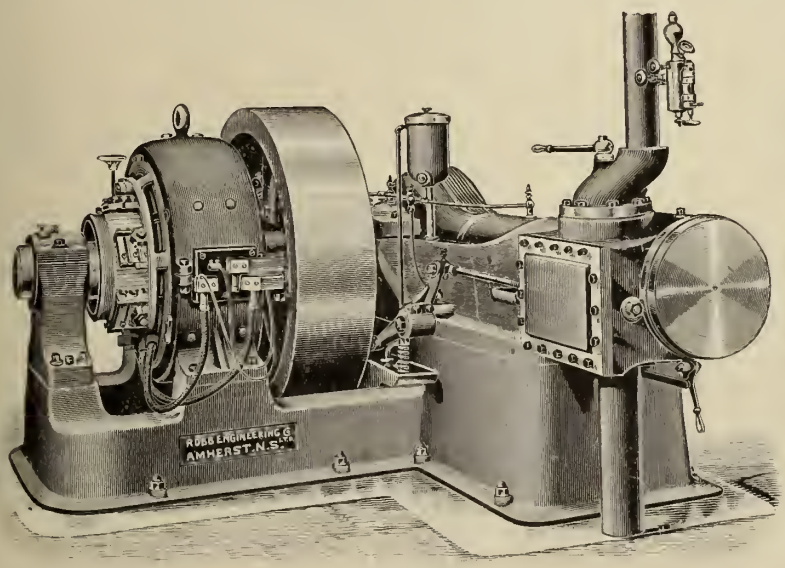
Not One Cent for Repairs!



An Experienced Engineer writes us as follows:

"After eighteen months of hard service, the 'Robb' engines are in excellent shape, running very smooth and without a bit of vibration. Up to this time they have not cost one cent for repairs, the only expense being for steam, oil and packing, and this lower than the average. Perfect alignment, parts well machined and good design, make the 'Robb' the most economical and labor-saving engine that has ever come to my notice."

Modern Canadian Manufacturing Plants.

ARTICLE XVIII.—New Plant of Chadwick Bros., Hamilton, Ont.

THE story of a business success is always worth telling, for who is not interested in and inspired by the knowledge that some other with only ordinary or less than ordinary chances has, through continued industry and progressiveness, developed a business from a very unpretentious to a quite pretentious standing? And thus the development of the brass goods industry of Chadwick Bros., Hamilton, will be of interest. Twelve years ago Chadwick Bros. was an unknown name in the industrial field, and the only evidence of such an industry was one machine in a cellar on a side street in Hamilton. There was practically no capital at the start, and the business has been built up in the oftentimes slow but of the sometime sure way of extending only as the profits of the business will allow, and not in the introduction of outside capital. The fact of the business having developed in this way from practically nothing to its present status, as shown in the size of the new plant, herewith illustrated, speaks well for the quality of the goods manufactured and the ability and progressiveness of those connected with the firm.

From the start there have been four brothers interested in the business—A. H. Chadwick, Frederick Chadwick, Chas. W. Chadwick, and John S. Chadwick. Each brother has charge of some department of the business, and the firm say that it is through this personal supervision that they are able to turn out the class of goods they do.

Plating Room : Chadwick Bros., Hamilton.

General Plan of Works.

The accompanying plan of the first floor of the new plant will show the general layout. There are two distinct buildings, one the main building and the other the brass molding shop. Both buildings are of brick construction with concrete foundations. The main building is a two-storey building with basement. It is divided into two distinct parts by a brick wall running from the bottom to the top of the building. One of these departments constitutes the general manufacturing plant, including the offices, while the other constitutes the storage and shipping departments. On each floor is an automatic fire-proof door between the two departments which, together with the brick wall, will prevent a fire in the factory from spreading into the storage and shipping rooms.

Heating and Ventilating.

The heating and ventilating system used is the hot blast system, installed by Sheldons' Limited. Fresh air is drawn through steam coils and is discharged into the building at the required points by means of galvanized pipes, the system giving a complete change of air every twenty minutes. The boiler supplying steam for the coils is heated by natural gas. The burners consist of six cast iron tubes, supplied with rows of holes running the entire length of the boiler, the correct amount of air being mixed with the gas before it is supplied to the burners. During the Summer two out of the six burners are run to supply steam for the heating of materials in the finishing departments.

Power and Power Transmission.

An induction motor supplies the motive power for the shafting throughout the building. The power transmission appliances, including the shafting, counter-shafting, hangers, etc., was installed by the Dodge Mfg. Co. The buildings are equipped with the Canadian Magneto fire alarm system.

The General Manufacturing Section.

In the basement of the general section is the blacksmith shop, the boiler room, the heating and ventilating apparatus and the scrap room. The floor of the basement is concrete.

The first floor is partitioned off into several departments, including the buf-

Brass Moulding Shop : Chadwick Bros., Hamilton.

fing room, the plating room, the press room, the dipping and sand blasting room, the finishing room and the lacquering room, the board partitions being to prevent stray dust from the buffingroom from penetrating to the plating room and the fumes from the acid baths and the lacquering process from spreading throughout all the departments.

Brass Finishing Room : Chadwick Bros., Hamilton.

The buffing room is equipped with buffers of the firm's own make and also of Hanson Van Winkle; and the room is kept clear of dust by a suction fan installed by Sheldons, Limited.

In the plating room the various plating processes are carried on, including silver, nickel, copper and brass platings. The plating dynamos were installed by Hanson Van Winkle. In all there are about 2,000 gallons of the different solutions in the plating room.

The press room is equipped with five presses, one drawing press, three stamping presses, and one drop press, the manufacturers represented being the London Machine Tool Co., E. W. Bliss Co., and McGregor-Gourley. The firm do most of their own stamping in ornamental brass work, only buying that class of pressed goods for which the demand is so small as not to be worth the investment in dies for the presses.

The brass goods are cleaned in acid baths or are sand blasted in the dipping and sand-blasting room according to whether the goods are to have a highly polished style of finish or the "satin" finish, sand blasting giving the latter.

In the finishing room the goods coming from the buffing room and dipping room are given the high finishing polish or are "colored," as it is called. From the finishing department the goods go to the lacquering department, where they receive their coat of lacquer.

The second storey of the general plant is all in one section, although there are several classes of work conducted in it, including brazing, chandelier fitting, metal spinning, brass finishing and tool making.

All the brazing is done with natural gas. The chandelier department is equipped with some special machinery of the firm's own make, including a line of punches, as well as the necessary bench tools required for chandelier fitting. The metal spinning process is very interesting, showing as they do the forming, in the spinning lathes, of sheet metal into any required shape. The spinning lathes were all built from the firm's own designs.

The equipment of the brass finishing department is very complete, consisting of some fifteen brass finishing lathes, representing the following makers: The Warner & Swasey Co., the Brown & Sharpe Mfg. Co., the London Machine Tool Co., McGregor-Gourley, and the Garvin Machine Co. A fitting bench runs down both sides of the department. Nearly all the tools and dies used by the firm are made by themselves, and for this purpose there is quite a complete tool room equipment, including two lathes, a McGregor-Gourley and a LeBlond, a McGregor-Gourley milling machine, four John Bertram drills, a shaper, and a special threading machine made by the firm themselves.

The Brass Foundry.

The molding shop has the ordinary equipment of a brass foundry, besides which there is installed a power sprue cutter, by the London Machine Tool Co., and a magnetic separator for the separation of brass turnings from bits of iron. There are in all ten brass furnaces, which furnaces, although at present using coke, will be equipped with natural gas burners. The floor of the molding shop is concrete. The lighting has been paid special attention with good results. At the end of the molding shop and separated from it by a brick wall and fire-proof door, is a

Lacquering Room : Chadwick Bros., Hamilton.

pattern shop, where a couple of men are continually busy. This department is looked after very closely. The users of brass castings have been unable in the past to procure castings free from holes, etc., and this firm is furnishing

Buffing Room : Chadwick Bros., Hamilton.

users of this class of goods perfect castings.

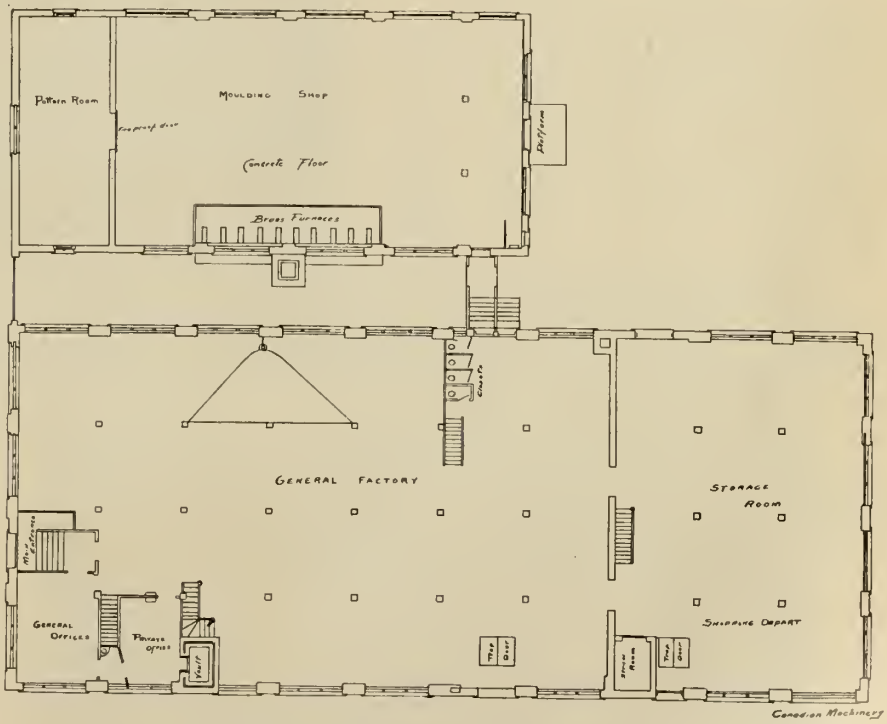
Shipping and Storage Facilities.

There is an immense amount of raw material and partially manufactured material kept on hand, as is evident from walking through the storage room. The second floor of the storage department is equipped with a two-ton hand crane, which runs out on its travel-way over the lane from where raw material is received. The shipping room has every convenience, including a straw storage department, which is a small chamber, concrete floor, equipped with fire-proof doors and a chimney, so that if the straw catches on fire the chamber acts as a stove and there is no harm done.

Conveniences for Employes.

Considerable attention has been given to the providing of wholesome conveniences for the employes. Each employe is provided with a locker, equipped with lock and key, and wash basin, each of which is numbered to correspond with the employe's number in the time system, which was installed by the International Time Record Co. Thus no dispute is likely to arise over either the locker or the basin. There is a bright, well heated and well ventilated lunch room in the basement, supdoubt the conveniences for employes plied with table and benches. Without are excellent.

Some of the goods made by the firm are : Engineers', plumbers' and steamfitters' supplies ; all kinds of gas and electric chandeliers; all kinds of ornamental brass or plated metal goods; all kinds of automobile, launch and carriage supplies and trimmings; brass water works supplies ; all kinds of office, bank and church metallic fittings; and the "Kingston" carburetter ; sections and church brass work, soda water fountains and confectioners' metal goods.



Ground Plan of Plant of Chadwick Bros., Hamilton.

BRITISHERS AWAKENING.

A NUMBER of important points in connection with the manufacture and sale of machinery in Great Britain, in so far as it affects American trade, are pointed out in a recent report by U. S. Consul Halstead, of Birmingham, Eng.

In British mercantile and engineering circles, he states, they are sometimes mildly sarcastic about the ease with which catalogues can be obtained from American manufacturers, disclosing designs, and even giving best discounts. In one case, which he knows, an applicant for catalogues and quotations of American products was a designer in the employ of an English concern, making articles in competition with the American firm, and it profited greatly by making copies of American articles. An application on a private letterhead or from aprivate address to an English firm, he states, would not receive any attention, and when made on business stationery would generally result in a personal call from one of the English concern's travelers, the object being to size up the applicant before quoting prices or letting him have the catalogue.

ARGUMENT IMPOSSIBLE.

Scene—A villa in a London suburb. Engineer from the supply company is going round with the lady of the house to find a suitable position for fixing the meter.

Engineer—I think we shall have to fix the meter at the back of this larder ; it seems to be the only place available.

Lady—Oh, dear ! I couldn't possibly have it there. A friend of mine has got it in the larder, and she finds it makes the meat taste so nasty !

The Canadian Fairbanks Co's. Warehouse.

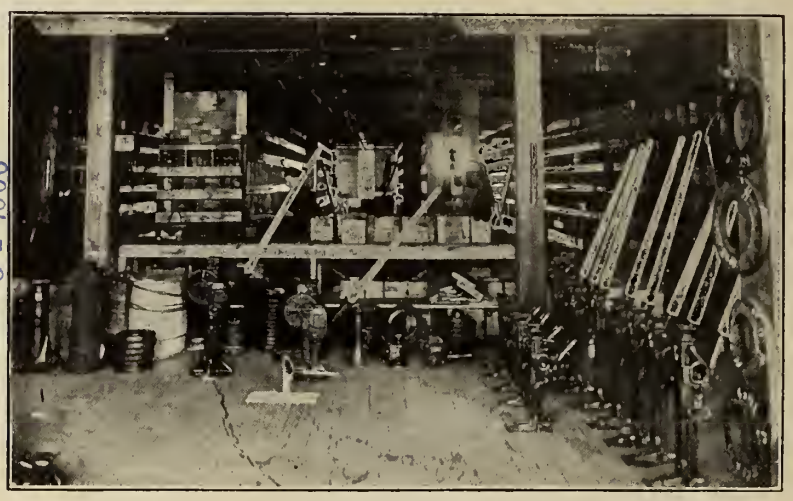
IT is just two and one-half years ago that the Fairbanks Co. established a warehouse in Toronto. This warehouse was destroyed in the Toronto fire of 1904, but a new building was at once started. In 1905 the business of the Fairbanks Co. was purchased by the Canadian Fairbanks Co., and at the same time arrangements were made with Fairbanks-Morse & Co. for the building of a plant in Canada for the manufacture of their product, the Canadian manufacturing firm to be known as the Fairbanks-Morse Canadian Mfg. Co.

The accompanying illustrations are of different sections of the new warehouse. The warehouse building is 41½ feet wide and 125 feet deep, and has five storeys and basement, representing a floor area of 31,122 square feet. The basement is used as a scale repair shop, and also as a gas engine floor. The ground floor is used as headquarters for the department managers, and as a sample room, the shipping room being in the rear of the same floor. The manager's office and the counting room, and also the valve and packing stock room are on the first floor. The second floor is devoted to cast and malleable fittings and steam specialties. The transmission department is on the third floor, and the fourth floor is devoted to standard scales.

Office and Counting Room : Canadian Fairbanks Co., Toronto.

The new manufacturing plant, which will be fully illustrated and described in a subsequent issue of Canadian Machinery, consists of the machine shop, the forge shop, the foundry and the power house. The machine shop is 285 feet long and 106 feet wide, and is two storeys in height, with galleries. The foundry is 72 feet wide by 130 feet long, and the blacksmith shop is 98 feet by 72 feet. The power house is equipped with two 180 h.p. suction gas producers, and Fairbanks-Morse gas engines belted to Fairbanks-Morse generators, which supply power for the individual drive motors throughout the plant.

The product of the plant at present will be gas and gasoline engines and steam pumps, although later on more lines will probably be added.



Pipe Fitting and Railway Supplies : Canadian Fairbanks Co., Toronto.

Sales Department and Show Room : Canadian Fairbanks Co., Toronto.

At the annual meeting of the shareholders of the Dominion Iron & Steel Co. at Montreal on June 29, the following directors were elected : Hon. Geo. A. Cox, H. F. Dimock, Hon. L. J. Forget, Hon. D. Mackeen, Hon. Robt. Mackay, Hon. Wm. McMaster, Frederick Nicholls, Sir Henry Pellatt, Dr. F. S. Pearson, J. H. Plummer, W. B. Ross, Elias Rogers, Sir Wm. Van Horne, H. M. Whitney, E. R. Wood. At a meeting of the directors J. H. Plummer was elected president and Hon. L. J. Forget, vice-president.

Edmonton's Call for Factories

By F. R. Munro.

EDMONTON offers to the Eastern Canada manufacturers some very attractive inducements to follow the movement westward and establish in the Alberta capital branch factories, which in less than a generation will probably be as large as, or larger than, the present size of the parent factories in the east. Edmonton is calling for industries, a large and rapidly increasing market in the vicinity of Edmonton

Scale Stock Flat: Canadian Fairbanks Co., Toronto.

is calling for manufactured goods; and Edmonton's call will not long remain unheeded, the Alberta market will not always be supplied with manufactured goods from the east. Manufacturers will appreciate the opportunities in Edmonton and they who "get in on the ground floor," those who are first to commence operations, will reap the largest benefits. If Canadian manufacturers do not seize the opportunity others will.

The Lesson of History.

Perhaps the Canadian manufacturer who reads this will remark that it is an old story, that the market is limited and he can very well continue to supply it from his eastern factory, that Edmonton is an over-boomed town, that there is bound to be a crash sooner or later, that the time isn't yet ripe for branching out in the west.

But what is the lesson of history? From the very first, Western Canada has suffered (and the east has also suffered) from the timidity and lack of confidence of the people of Eastern Canada. The great majority of both political parties lacked faith and were wanting in those powers of imagination without which men can accomplish very little constructive work.

The Initial Boom.

When the C. P. R. was building adventurous and restless spirits from the older provinces moved west, and very soon their hope of agricultural, commercial and industrial possibilities became profound conviction. They began to tell their eastern friends of the great opportunities in the new Canada beyond the lakes.

The boom of the early '80's, an eastCanadian boom almost wholly, rose and fell, enthusiasm waned, faith turned to doubt and for ten years the east lost interest in the west. The dauntless spirit of those whom the prairies had adopted kept up the propaganda and a few responded to their call.

Still Want Men.

The west still called for Ontario farmers and there still traveled eastward the same stories of the fertility of the western soil. Two Ontario counties, Huron and Bruce, responded to the call, but for the most part the invitation came to too cautious or unheeding ears. There could be nothing but "western blow" in the stories he heard of western opportunities. So the eastern farmer stayed where he was, in many cases to eke out a scanty existence on a stoney 50 acres when he could have had for the asking 160 acres of the most fertile soil in Canada.

The Eastern Canada farmer lacked faith!

No one now doubts the agricultural possibilities of the west for they have been proven by a succession of golden harvests, and thousands are moving into the land of promise. The appeal to Eastern Canada had for years fallen upon deaf and skeptical ears, and the west then turned to the United States with its story; and the result was that in two years more settlers came from the United States than had come from Eastern Canada in the preceding ten years.

The Manufacturers' Testing.

Will the Eastern Canada manufacturer be wiser than was the Eastern Canada farmer from 1885 to 1900? Just as insistently as the west called to the east for settlers it is now calling for manufacturers, and with stronger claims, for while there is still plenty of land for the newcomer, the manufacturing trade, once secured, will be held,

Scale Repair Room: Canadian Fairbanks Co., Toronto.

and those that get in now will grow with the country.

Winnipeg, Regina, Calgary, Edmonton and other centres present strong claims upon the serious attention of the

Page 20

eastern manufaeturer and it remains to be seen whether he will profit by the lesson of the last two decades, or whether he will wait for the American manufacturer, with his optimistic aggressiveness, to show him the way. Does the Eastern Canada manufacturer also lack faith? The next two years will answer the question.

American capital has reaped the largest profits from land speculations, and there is now very little land remaining which ean be obtained by capitalists en bloc; but American faith in the future of Western Canada is growing stronger every day and there is nothing more sure than that if the Canadian manufacturer does not soon awaken to his opportunities, American capital will very shortly build large factories in the farthest west. People will not forever be content to send 2,000 miles east for their goods, and the manufacturers who first commence to supply Alberta with goods "made in Alberta" will be apt to secure and hold the Alberta trade. The market is already a large one, but it is only in its infancy. A generation from now it is more than likely that the population west of the lakes will be larger than the population east and the western market will be larger than the eastern! Will it be served by Canadian manufacturers who have established their factories in the west or will it belong to the alert Americans?

What Edmonton Offers.

What, then, are the special advantages which Edmonton offers to the manufacturer? Cheap power, abundance of raw material, good transportation facilities for the assembling of raw materials and for the distribution of the finished products, and proximity to a good market—these are the prineipal requirements of a good manufacturing town, and all of these Edmonton has to offer.

Cheap Power.

Is there any other place in the world where abundanee of good coal may be had at $1.50 per ton, where expensive mining operations are not required, but where the coal may be loaded directly into barges and wagons? This is what Edmonton has to offer in the way of cheap fuel and consequently cheap power, and apparently she can offer it in practically unlimited quantities. For miles in all directions from Edmonton there is abundanee of good coal at a very small depth below the surface of the ground. Extensive mining operations have not yet been attempted; no shafts have yet been sunk, all the mining being done on the level. The coal has practically all been obtained along the high river banks into which the miners dig and load their coal directly into barges. Until a short time ago coal was selling in Edmonton at $1.50 per ton; at the present time, owing to temporary circumstances, the price is a little higher. Practically the whole cost is transportation, and as teamsters are now commanding wages of $4.50 to $5 per day, as compared with $3 a short time ago, the price of coal has been slightly advanced. With mining operations on a large scale and up-to-date methods of delivery, coal will be less than $1.50 per ton. This coal is well adapted for both manufacturing and domestic purposes, and there are great opportunities for the development in Edmonton of an immense coal mining industry.

Coal being so cheap, little attention has yet been paid to the development of water power; but Edmonton is rich in "white coal" as well as in black, and should the supply of the latter ever be exhausted there is any amount of the former now going to waste. The city now has its own electric light and water plants and is prepared to assist small industries by supplying cheap power, water and light.

Transportation Facilities.

Abundant raw material for various industries is also close at hand, but as this phase of the situation can be best treated by example it is discussed below in connection with specific industries. Equally important is the question of transportation. Two railways, the C.P.R. and the C.N.R., now serve Edmonton and a third, the G.T.P., is assured in the very near future. While the plans of James J. Hill are not yet definitely known, it is unlikely that he will overlook Edmonton. It may therefore be safely assumed that in the very near future Edmonton will be served by four different railroads.

The Market.

What of the market for Edmonton-manufactured goods? Not so large yet as it very soon will be, but nevertheless a market of respectable proportions. Moreover, it is a market with larger

proportionate buying powers than a market in the east. Westerners make money more easily than easterners and they spend it more readily. At the present rate of immigration it will be a very short time until there are as many people west of Winnipeg as east.

Pipe Shed: Canadian Fairbanks Co., Toronto.

The manufacturer first in the field will possess a very considerable advantage. Some manufacturers somewhere will very soon appreciate the possibilities of profit in supplying western people with western-made goods. If the Canadian manufacturers do not seize the opportunity others will.

Soap Makers.

As a consumer of by-product the soap factory is a natural adjunct of the packing industry. At the present time there are two soap factories in the west with a third projected in Saskatoon. These factories can not supply the rapidly growing western market. Eastern-made soap is sent in by the carload. A factory in Edmonton would be in a splendid position to compete for western business.

Although Edmonton is a milling centre of considerable importance, every pound of biscuits consumed in Alberta is brought hundreds and thousands of miles over railroads which have already hauled east the wheat or flour of which the biscuits are made. Is it reasonable to suppose that this will continue indefinitely? There can be but one answer, and again the question arises whether the industries of the Edmonton to be will be built by Canadian or by American capital.

Flour and Cereal Mills.

Already the flour milling industry of Edmonton and the neighboring town of Strathcona has reached large proportions, but it is capable of great expansion and the production of cereals has scarcely commenced. Oats weighing 40 pounds per bushel are ordinary in Alberta and 48-pound oats are not uncommon.

There is a heavy demand in the west for building material, including paint, and consequently a large market for linseed oil, which makes the opportunity for linseed oil mills at Edmonton. The Alberta climate is admirably adapted for the growing of flax.

Pressed Brick Works.

The manufacture in Edmonton of pressed bricks is already a very considerable industry and the product is entirely consumed in the home market. Orders have come unsolicited from as far east as Winnipeg, but Edmonton manufacturers are not yet able to fill them. This industry is capable of large expansion.

Edmonton is also a lumbering centre of some importance, the mills cutting about 20,000,000 feet of lumber last year. A new mill is now being built which, it is estimated, will increase the output 50 per cent. The timber is brought down the Saskatchewan River and the supply will last for many years to come. An integral part of the lumber industry is the planing mill and sash and door factory, and they are on a large scale in Edmonton. These manufacturers are branching out and are now making a fine line of bank and office fittings as well as store fixtures, etc.

Manufacturers Coming.

In one months' time the Canadian Manufacturers' Association will come west to their annual convention in Winnipeg. Following the convention there is to be a tour of the west, and Edmonton is among the points to be visited. Manufacturers will then have opportunity to see for themselves the solid advantages which Edmonton has to offer. They will appreciate the opportunities offered by cheap power, unsurpassed distributing facilities and a rapidly growing market. They will also appreciate the equitable system of taxation in force in Edmonton, for the city has practically a single tax. Land values only are taxed and a manufacturer is not fined by the city, by the way of increased taxes, when he erects valuable buildings. Moreover, the rate of taxation is not high, the average for several years having been about 16 mills.

When they consider all these advantages, it is confidently believed that many Canadian manufacturers on their western tour will decide to establish branches in Edmonton. One thing is certain, industries Edmonton must and will have; whether Canadian or American remains to be seen.

THE FIGHT FOR BLUE SKY.

FOR years the agitation to do away with the smoke nuisance in large cities has been going on. Laws have been passed to restrict the nuisance and fines imposed from time to time with more or less success. The matter is receiving more than usual attention at the present time in the United States and Canada. In Montreal and Toronto there is no more prominent subject before the people. That the nuisance can be abated or at least very nearly so, has been demonstrated from the results obtained in cities in the United States, where, under the direction of a supervising engineer, careful tab has been kept on every stack in the city. It has been the policy of the inspector to a large extent to employ educational methods and persuasion rather than compulsion. This method has accomplished successful and evident results.

In Toronto, according to Property Commissioner Harris, the foregoing method has been adopted, and although the results have not come up to the expectations of the general public some good has been done. It is hard, however, for a municipality to expect manufacturers and others to conform to a law which it itself passes by with apparent contempt. The City of Toronto is the greatest offender within its limits, of the smoke nuisance, particularly on the harbor front, where every day and for long periods great clouds of black smoke belch forth from the civic plant to darken the surrounding atmosphere. The excuse is made that apparatus installed to avoid this does not work satisfactorily, but until the city can set the manufacturers a better example it is in a poor position to expect the carrying out of the by-law on the city's statutes to restrict smoking chimneys.

Ahead of manufacturers as offenders in the smoke question comes the railroad. The railroad section of any city generally is the smokiest part, and anything that could be devised to abate this nuisance in railroad yards would be welcome. It was announced at the smoke abatement convention in Detroit that such an apparatus had been adapted to steam locomotives which could be installed at small cost. We have not yet seen anything of this, but should the report be true the railroad corporations will no doubt be quick to adopt it.

While manufacturers are not by any means the greatest offenders in this connection, there is a great deal that can and no doubt will be done by them in the near future to remedy the situation. Going to the root of the trouble, very often the design of the furnace is at fault, and in the past whatever boilermakers chose to recommend has been much too readily accepted. The furnace construction, according to the best authorities, must be adapted to the fuel, and it is absurd to suppose that furnaces designed for burning anthracite or semi-anthracite will satisfactorily burn fuels containing 30 per cent. or more of volatile matter. The percentage of volatile matter which a fuel gives off when heated is in fact a measure of the size of the chamber required for its complete combustion, and it is here that the laboratory examination of fuel yields results of the greatest value. That such an examination is still regarded as unnecessary and is no help in the placing of contracts, is clear proof of how much is still to be learned in the scientific control of a steam plant. In designing a plant let the manufacturer insist that the designer is not denied to plan such that at a small additional cost will give him a furnace admirably suited to his requirements. The furnace must fit the fuel, there is no getting around the fact, and, likewise, the furnacing must be properly done.

A custom is too much in vogue among manufacturers to hire any laborer who may be handy to fire his boiler, when in reality to have it properly done requires not only experience but expert handling and good judgment. A good fireman will pay for the difference in additional cost by greater economy of fuel consumption many times over in a year. If manufacturers were only alive to this fact the smoke nuisance would be greatly abated. An expert fireman can keep up steam and have very little smoke appearing from the chimney, provided he is laboring under favorable conditions, when at the hands of a poor or inexperienced fireman the smoke nuisance will be at its height.

Mechanical stokers have and are doing heroic service in this connection. Some go as far as to say that they are absolutely the only cure for smoke with smoky fuel. Without going as far as that, it is safe to assert that their general adoption under present conditions will go a long way towards relieving the situation. To bring about the millenium in this direction it will be absolutely necessary for all hands to co-operate. Municipalities must begin by setting a good example, railroads

must adopt the latest methods available and manufacturers must accept a reasonable view of the situation and take what steps that lie in their power towards rendering the atmosphere of our larger communities more fit to live in.

SPLENDID CROP PROSPECTS.

THE prosperity of Canada being directly dependent upon her agricultural industry, it is gratifying that reports received from authoritative sources find the crop prospect very satisfactory. Interest in this regard turns primarily to the west, with each year a greater field to be reckoned on. Thousands of acres of rich prairie are being broken by the settler every day, and next season will add their quota to swell the immense grain product. Last year's yield, considered by the acre or as a whole, was wonderful, and if Nature is propitious the crop now in the ground will, by reason of increased acreage, far surpass it. What the influx of people will be during the present Summer it is difficult to estimate, but it will constitute another movement of the entering wedge that is to bring this fair Dominion a population of fifty millions in a few decades, and raise Canada's standard to a high place among the nations of the world.

All this means an agreeable situation to the manufacturer, who looks to the west as a the great receiving ground of his output, relieving him of any anxiety regarding future demand in view of lack of prosperity. When the farmer smiles everyone smiles, so that there is every indication of smiling days in Canada, not only for the farmer, but for the laborer, the mechanic, the merchant and the manufacturer.

JULY METAL FEATURES.

UNSETTLED conditions characterized several items on the metal list during July, and nearly all the prominent commercial metals are selling at lower prices now than they were a month ago.

Tin has been the most unsteady of all. Fluctuations were almost daily and became so violent that leading Canadian metal merchants refused to quote prices except on receipt of specifications. The tendency, however, was generally downward, and at the present time a price of 43c. is easily obtainable. Even that figure will be shaded for good round lots.

Pig lead had declined steadily up to the middle of the month. The opening of each week saw a slight rally over the conditions at the close of the previous one, but until the time mentioned quotations had gradually eased off so that a price of $4.30 per hundred pounds was reached. A sudden reaction then set in. Almost immediately an advance of 10c. was declared, and at time of writing the bulls are apparently in control of the market, with every natural condition in their favor.

Zinc spelter aroused considerable interest early in the month by advancing about half a cent on this side of the ocean, due to an invasion of the market by European buyers. It was not long before producers were sold out for months ahead. But some operators who held large stocks of the metal suddenly unloaded, through a desire to realize at once instead of awaiting developments, and the price on most brands fell to practically the old quotations. There is a tremendous demand for galvanized sheets and other materials into which spelter largely enters, and the probability is that values will again be enhanced.

The arrival of reasonably large stocks of antimony created a sagging movement in that market. The price, which had gone up to over 30c., dropped to 28c., and concessions for large orders are given on that quotation. Even so, conditions are most abnormal, quotations being about four times what might be termed the regular price of antimony.

Copper is the only ingot metal which has steadily maintained its strength throughout the month. Many large Canadian dealers who sent in their specifications to producers have been informed that these could not be filled for some time to come. The price, however, has remained without change, as it is said that producers, wishing to ensure evenly distributed deliveries, have discountenanced an advance.

MACHINE TOOL SITUATION.

NOT in the history of the machine tool trade in Canada has there been such a peculiar situation as exists to-day. Owing to the unprecedented demand for all classes of machine tools manufactured both in this country and in the United States, the makers have become far behind in their orders. Not long ago thirty and sixty days' delivery was considered excessive. To-day orders are being taken for delivery in the Spring of 1908, and scarcely any order on any line under ninety days. All this is a remarkable evidence of the prosperity of this country. Machine tool manufacturers and agencies are not mourning over the lack of supply. The whole tendency of the inability on the part of manufacturers in general to receive machine tools within a reasonable time has reacted for good. On not being able to receive the machines better and deeper plans for the future have been laid, with the result that instead of ordering fewer machines orders for more have been placed.

One of the largest machine tool firms in Canada finds itself without a machine tool in its warehouse, and with no prospect of any change in the situation for several months to come. In view of the fact that such conditions exist there is every reason to believe that not only will manufacturers plan much more than heretofore for the future, but also to work their present equipment with the greatest economy.

CANADIAN TRADE WITH UNITED STATES.

PEOPLE generally are not aware of the immense value of goods imported into Canada from the United States each year. During last year the total amount of these imports was over $152,000,000, or nearly three times the amount imported from the United Kingdom. On the other hand, Canada is finding a market within the domains of Uncle Sam, which trade is increasing in a satisfactory manner.

Recently a good move has been made by superintendent of commercial agencies, Mr. F. C. T. O'Hara, at Ottawa, in enlisting the active support of the British consuls throughout United States in favor of Canadian trade extension. During the month of March past Canada imported from the United States $15,000,000 worth of goods, one million and a quarter more than in March last year. In the same time Canada sold to the States a little less than six and a half millions worth. This shows that Canada's sales to the United States are not only capable of expansion, but that they are expanding in a satisfactory manner. The British consular service in the United States is ready to help to further increase this trade. Canada is developing at a much greater rate than the United States, and consequently is becoming a better market with each succeeding season, but as her own resources are being developed she is reaching a position where more and more an outside source of trade can profitably be sought.

Electro-Thermic Smelting Experiments

A History of the "Soo" Experiments, Based on the Preliminary Report, Recently Issued by the Mines Branch, Department of the Interior.

IN December, 1903, the Dominion Government appointed a commission to go abroad and investigate the different electro-thermic processes for the smelting of iron ores, and the making of steel, then being operated in Europe. The only experiments, however, which the members were able to witness were those made by Dr. Heroult at La Praz, and Mr. Keller at Livet, France.

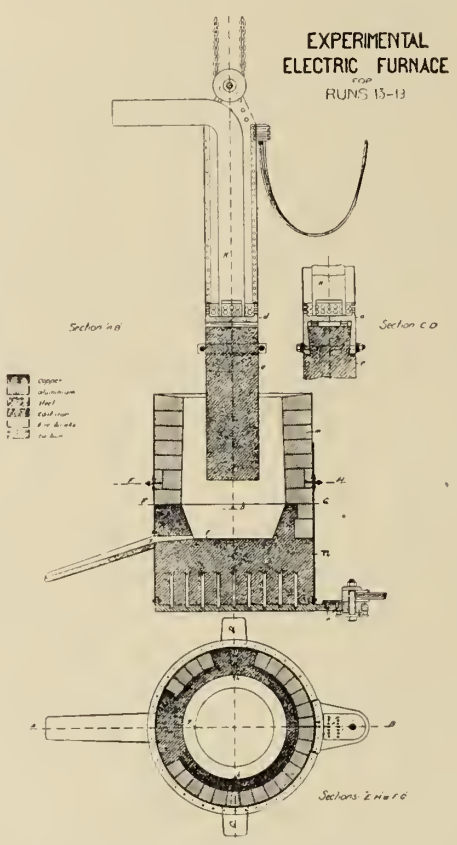
In the former case, the results were not such as to permit any reliable conclusion to be drawn, and, in the latter, experiments with widely divergent issues, were conducted on a very porous hematite ore containing a small percentage of sulphur. As Canadian ores are largely magnetite, with a comparatively high sulphur content, none of these experiments could be said to have been satisfactory, as they left undecided not only the amount of electric energy required per ton of product, but also the following important points, referring to Canadian conditions: "1st. Can magnetite, which is our chief ore and which is to some extent a conductor of electricity, be successfully and economically smelted by the electric process? 2nd. Can iron ores with comparatively high sulphur content but not containing manganese be made into pig iron of marketable composition? 3rd. The experiments made at Livet with charcoal as a reducing agent in substitution for coke having failed, could the process be so modified that charcoal, which can be cheaply made from mill refuse and other sources of wood supply useless for other purposes, could be substituted for coke? This is especially important since charcoal and peat-coke constitute home products, while coal-coke for metallurgical processes requires to be imported into the Provinces of Ontario and Quebec."

The solution of these problems was necessary before any judgment could be passed on the probable success of electric smelting in the Canadian ore fields, where water power is plentiful, but metallurgical coke is expensive, through lack of coal. Therefore, the Government authorized a series of experiments in electro-thermic smelting of Canadian ores, which were to be carried on under Government auspices. As the Lake Superior Corporation offered every facility for carrying out this purpose, the experiments were conducted at Sault Ste Marie by Dr. P. Heroult himself.

Preparations for Experiments.

The furnace used for the experiments proved to be unfitted for some of the charges, and defects were shown which could be remedied in those of larger capacity should the process be applied commercially.

In charging the furnace, which was lined with common fire brick, a crucible consisting entirely of carbon, was adopted. The electrodes were manufactured in Sweden on the Heroult principle and the contact was conveniently arranged for regulation by hand. The current was led from the transformer to the bottom plate contact of the furnace by conductors consisting each of thirty aluminum cables $\frac{5}{8}$ inch in diameter. Measuring instruments were provided so that it would be possible to exactly estimate the amount of electric energy consumed.



Electric Furnace Used in Soo Experiments.

The Experiments.

About the middle of January the experiments began and were carried on almost continuously until March 5, with the result that some 150 casts were made, produeing 55 tons of pig iron. Difficulty was experienced in stoking, as the space between the walls of the furnace and the electrode was too narrow. It was shown, however, that in a furnace so constituted that the electrode could be kept isolated from the charge, production might be considerably increased by the introduction of an air blast.

Cost of Production.

It is estimated by Dr. Haanel, superintendent of mines, that the largest unit which can at present be constructed on the model of the furnace employed in the experiments, will not exceed 1,500 h.p. On this basis, allowing for a normal annual production and assuming cost of developing 1 electric h.p. as $50, the production of pig iron by electrothermic smelting would approximate $10.69 per ton.

Summary of Results.

The actual conclusions reached from the "Soo" experiments are thus summarized in the preliminary report:

"1st. Magnetite can be as economically smelted by the electro-thermic process as hematite.

"2nd. Ores of high sulphur content not containing manganese can be made into pig iron containing only a few thousandths of a per cent. of sulphur.

"3rd. The silicon content can be varied as required for the class of pig to be produced.

"4th. Charcoal, which can be cheaply produced from mill refuse or wood which could not otherwise be utilized, can be substituted for coke as a reducing agent, without being briquetted with the ore.

"5th. A ferro-nickel pig can be produced practically free from sulphur and of fine quality from roasted nickeliferous pyrrhotite.

"6th. The experiment made with a titaniferous iron ore containing 17.82 per cent. of titanic acid permits the conclusion that titaniferous iron ores up to perhaps 5 per cent. titanic acid can be successfully treated by the electric process."

Apparently all that remains to assure the success of electric smelting of Canadian ores is a furnace of altered model, which will obviate the difficulties experienced in the experimental plant. The future of our northern ore fields is staked on the outcome of efforts along these lines. If they are satisfactory, the presence of abundant water power and unknown quantities of magnetite ores will off-set the absence of coal, and there will be nothing to prevent the rapid building up of Canada's iron and steel industries.

Belting and Transmission of Power

BY C. CHARLES MAISON, E.E.

THE transmission of power by means of belts is a subject of great importance, and one that should receive much study and thought from the practical machinist and others. A better knowledge of the characteristics of belting, and the problems of belt gear-

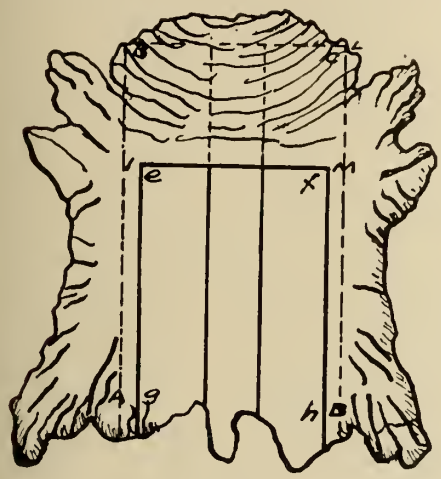


FIG. 1.

ing, increases materially the respect of the average mechanic and engineer for a piece of good leather.

We all, more or less, know that a belt is a flexible band passing over two or more pulleys for the purpose of transmitting motion from one to the other. As its drive depends on its frictional resistance to slipping, and as it is of a more or less elastic nature, it cannot be depended upon for transmission of exact velocity ratio.

Classes of Belting.

There are two general classes of belting, flat and round, the former being used on crowned pulleys and the latter on grooved or sheaved pulleys. The materials used in the manufacture of belting are leather and cotton for flat belts, and leather, cotton and manila for the round belts. Rubber is exclu-

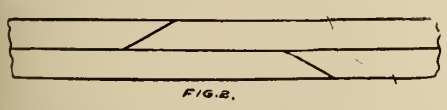

FIG. 2.

sively used on cotton belting for increasing the driving power and rendering them water proof, but of all these materials leather is the most important.

Making of Leather Belting.

In Fig. 1 is illustrated the character of the leather used for belting. The portion included in the dotten lines (A, B, C, D), is used for the various grades of belt, and is termed a "butt." The portion of the hide outside the "butt" is soft and flabby and, although frequently used in cheap belts, is really unfit for belt making. The portion (E, F, G, H), is used for making the best class of belting, it being the strongest and most uniform part of the hide, while the part (I, K, L, M), is known as the shoulder stock, and is used for the lower grades of belting.

All hides used for belting leather should be carefully tanned, and afterwards curried or softened by "stuffing" with hot grease, a process which lubricates the fibres of the leather and converts the hard, dry hide, as left by tanning, into a strong, pliable leather.

Best Arrangement of Leather Belting.

Double belts are used for transmitting greater power than the single belt will satisfactorily stand. Usually for driving belts it is better to use a double belt than a single one of greater width. Light double belts make good shifting belts, where there is considerable wear on the edges of the belt. A double belt should not be used on pulleys of too small diameters, as the short bend over the pulley tends to crack the leather. In a piece of leather belting the

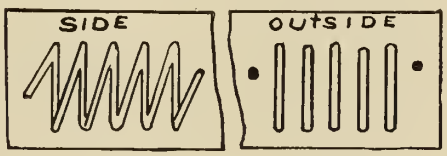

FIG. 3 FIG. 4.

strongest section is on the flesh side, the hair side being hard and liable to crack. For this reason the hair side of the belt should be run next the pulley, as it brings the fibres on the flesh side, which can best resist the strain, under tension as the belt passes over the pulley, and the fibres on the hair side under compression.

Power Transmitted by Leather Belting.

The power that can be transmitted by a belt varies widely, according to conditions, and consequently fixed rules cannot be laid down for the calculation of belt powers. Since a pull of 33,000 lbs. through a space of one foot in one minute represents one horse-power of work, a pull of 33 lbs. through a space of 1,000 feet in one minute would represent the same amount of work. Thus, by increasing the velocity or the tension, the work performed is correspondingly increased.

The working strain on good leather belting may be taken at from 45 to 60 lbs. per inch of width for single belts, and at double that for double belts. From the above, a heavy single belt running at 1,000 feet per minute will transmit 1.8 h.p. per inch of width, and a double belt at the same speed would transmit 3.6 h.p. per inch of width. At 4,000 feet per minute these same belts would transmit 7.2 and 14.4 h.p. per inch of width, respectively.

Excessively tight belts should be avoided, not only because of the injury to the belt, but because of the excessive strains on shafting, boxes and pulleys.

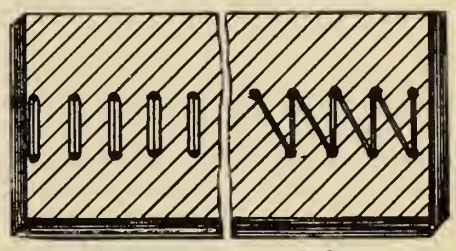

FIG. 5. FIG. 6.

Covering the face of the pulleys with leather increases the coefficient of friction of the belt from 30 to 40 per cent. A cover of this kind must be carefully put on to secure the best results, the leather from which it is made being scraped to uniform thickness and fitted closely over the pulley.

Joints in Leather Belting.

Whenever the character of the work permits, leather belts should be made endless by beveling the ends and making a glued lap joint. This constitutes a strong joint which runs smoothly over the pulleys. This is most important in the case of high speed belts operating on pulleys of small diameters. In double belts the joint should be lapped as shown in Fig. 2. It is not necessary to use rivets or other fasteners in connection with the glued lap

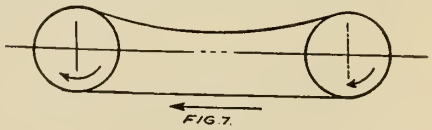

FIG. 7.

joints. In fact the best practice now dispenses with them entirely. In gluing

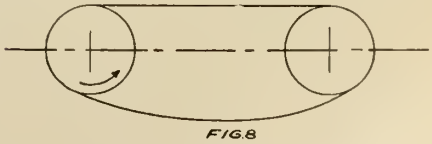

FIG. 8

joints, however, special glue should be used, and should be applied hot to both surfaces, in order that it may penetrate well into the pores of the leather.

The time-honored method of lacing belts with thongs of rawhide has about given place to the better practice of

using wire lacing, or to a limited few of the many patented belt fasteners. The usual trouble with fasteners arise not from the fastener itself, but from its improper application. Heavy belts should, for gluing or lacing, be drawn together by means of belt clamps. The holes should be punched exactly opposite each other and should be the small-

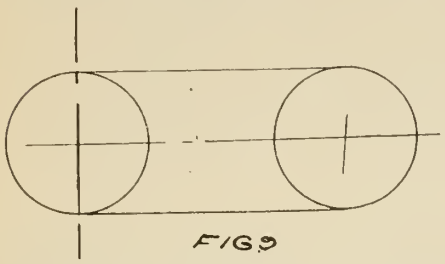

FIG 9

est possible that will let the lacing through. In the case of rawhide lacing, the usual mistake of using too few strands and too heavy a thong should be avoided. In Figs. 3 and 4 are shown very satisfactory methods. The strands on the inner side should be about $\frac{5}{8}$ of an inch apart, and the staggering of the holes gives a firm hold on the ends of the belt. In Figs. 5 and 6 are shown the method of lacing belts with wire lacing. The method is practically the same as with thongs. The wire used is of comparatively high tensile strength and very pliable.

Methods of Driving.

In the majority of cases belts are used to connect parallel shafts. When shafts rotate in the same direction the connecting belt is called an "open" belt, and when they rotate in opposite directions it is called a "crossed" belt. The "arc of contact" is that portion of the pulley's surface covered by the belt. It is evident that the "arc of contact" is greater with the crossed than with the open belt, and that a crossed belt will, other conditions being equal, transmit more power than an open one. Wide crossed belts should be avoided in cases where the shafts are close together. For narrow belts 10 to 15 feet are good centres when the belts are operating over pulleys of comparatively small diameters. When possible the lower side of the belt should

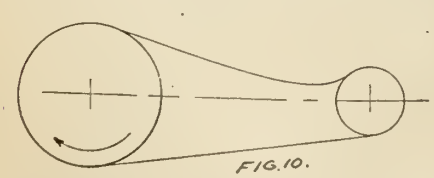

FIG.10.

be the tension or driving side, making the condition as shown in Fig. 7. If the top side is the driving side, the condition becomes as shown in Fig. 8. The arc of contact in the first case is much greater, and as a consequence a more powerful drive is obtained than in the latter case, all other conditions being equal. When parallel shafts in a vertical plane are connected as shown in Fig. 9, the tension must be much greater than in the cases already referred to, inasmuch as the height of the belt tends to hold it away from the lower pulley. When the difference between the diameter of the pulleys is great, a heavy belt on fairly long centres, run as shown in Fig. 10, should be used whenever possible. When centres are close and a tightner becomes necessary, it should always be put on the slack side of the belt, as shown in Fig. 11. This location puts a minimum amount of pressure on the tightner and its bearings. Tightner pulleys should be of liberal diameter in order to prevent noise and wear due to high rotation and injury to the belt due to a short reverse bend.

In Fig. 12 is shown a method of driving two parallel shafts from a third parallel with them. One belt runs on top of the other on the driving pulley.

When belts are not to be shifted the usual method of guiding is by crowning

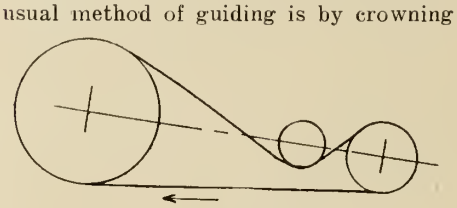

FIG.11.

the face of the pulleys. The belt then tends to run on the high part of the pulley for the following reasons: If,

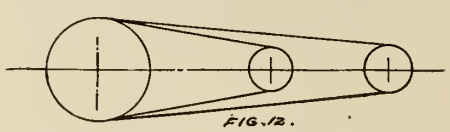

FIG.12.

as shown in Fig. 13, the belt is forced to one side, the edge (a) becomes stretched, making that part of the belt in contact with the pulley's surface of conical shape, with the edge (a) traveling faster than the edge (b), thus causing it to run in the direction of the arrow and to centre itself on the pulley.

Thus, when the shafts are parallel, the belt always runs to the high part of the pulley. If, however, the shafts are not parallel, and the high side is caused by the position, and not the shape of the pulley, as shown in Fig. 14, the belt runs to the low edge as it passes on to the pulley in a spiral direction, and all points where they first come in contact with the pulley's surface are carried in the direction of the pulley's rotation as indicated by the arrow.

It is always best, when possible, to apply power to a line shaft as near its centre as possible. Heavy drive pulleys should be placed close to the hangers, and the belts should lead in opposite directions as much as possible, in order to balance up those strains which tend to throw the shaft out of alignment.

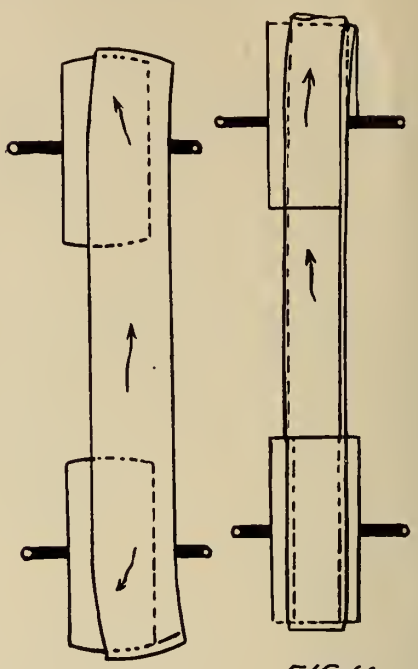

FIG13. FIG.14.

The following ratio is used in computing the speed of pulleys:

$$\frac{\text{Diameter of driver}}{\text{Diameter of driven}} = \frac{\text{Revolutions of driven}}{\text{Revolutions of driver}}$$

Take as an example Fig. 15. The pulleys (A, B, C and D) are, respectively, 40, 10, 60 and 8 inches in diameter, and the shafts make 100, 400 and 3,000 revolutions per minute. This constitutes a compound drive. But consider each drive separately. Assume (A) as the driver of the first pair, and (C) the driver of the second pair. (B) and (D) are driven. If (A) and its revolutions, and the diameter of (B) are given, required to find the revolutions of (B):

$$\frac{40}{10} = \frac{\text{revolutions of B}}{100}$$

$$\text{Revolutions of B} = 100 \times \frac{40}{10} = 400$$

If (D) must make 3,000 revolutions, and its diameter is assumed as 8 in.,

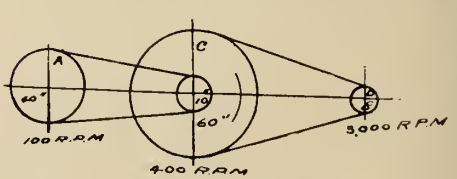

FIG. 15.

then to find the diameter of (C) we have:

$$\frac{\text{Dia. C.}}{8} = \frac{3000}{400}$$

$$\text{Dia. of C} = 8 \times \frac{3000}{400} = \frac{240}{4} = 60.$$

Milling Cutters : How They are Made, Used and Abused.

By John Edgar.

ARTICLE IV.

NOW that we have our cutter milled and so far along we may proceed to harden it. This is the most troublesome part of the job and a part about which very little can be said that will prove of help to those that may

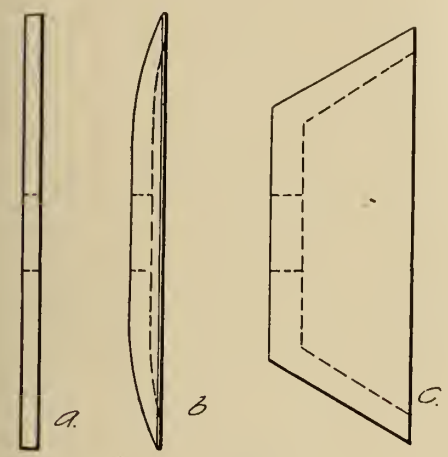

Fig 16.

wish to follow our advice. The best that can be done is to describe the methods in use.

Hardening and Tempering of Cutters.

The cutter is first heated to a red heat, the degree of heat depending on the grade of steel. The means of heating varies with the size of cutter. Small cutters are immersed in a lead bath in a crucible, only pure lead being used for this purpose. The larger cutters are heated in specially arranged furnaces, some of which are heated by gas, some by oil and others by coal or coke. The special grades of high speed steel require very high temperatures, and also require considerable skill in handling. The cutter after being heated is given a bath in oil and is then tempered in the usual way.

The Grinding of Cutters.

After the hardening and tempering process is completed we proceed with the grinding. The hole is first ground, and one end being faced at the same setting, the other end is ground by turning the cutter around. When this is done the teeth are ground over the tops to insure that they run true with the hole and ends. Then we proceed to sharpen the cutter teeth to fit them for the work they are to do.

Sharpening of Cutter Teeth.

There are several different styles of machines on the market which are especially adapted to use for this kind of work. The methods of operation are essentially the same, so that a general description of the method adopted on one style of machine will suffice.

There are several kinds of emery wheels, varying in grade and shape. There are three shapes that are extensively used in cutter grinding. These are shown in figure 16, (a) being termed a disk wheel, (b) a disk wheel, (c) a cup wheel.

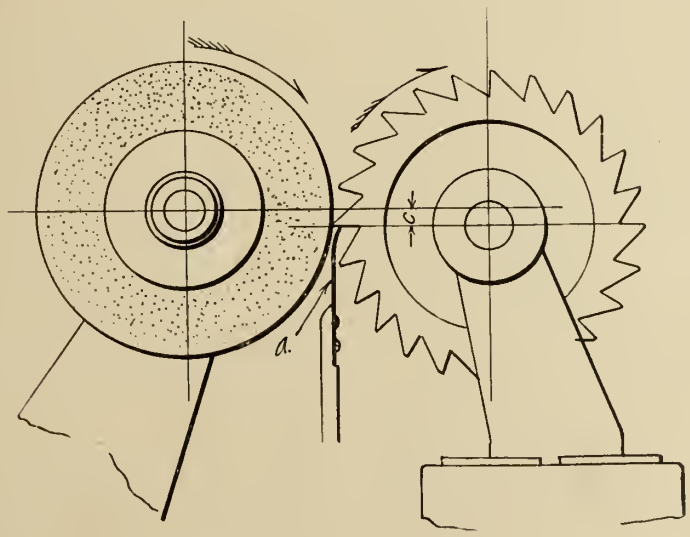

Fig 17.

Figure 17 shows an end view of a cutter and wheel in position for grinding the teeth on the periphery. The cutter rests on the finger (a) which gauges the clearance. When grinding mills with spiral teeth the finger is held stationary, the tooth sliding over it.

The wheel should be as large in diameter as possible in order to give as straight a back rake or clearance as possible ; if too small a wheel is used the tooth will be very slim at the cutting edge and will not be able to stand up to the work for any length of time. The effect of the diameter on the cutting edge is illustrated in figure 18, (a) being the shape produced by a cup wheel or a disk wheel used as in (a), figure 20. When the teeth are very fine and the cutter is comparatively large in diameter, the cup wheel may be used to grind the teeth. Some advocate the use of the cup wheel to the exclusion of all other forms, but present practice limits its use to the grinding of end teeth of end mills and side teeth of straddle mills. But this work may be done with the ordinary disk wheel. Figure 19 shows the cutter in position for grinding the side teeth with a cup wheel, and figure 20 shows how this would have to be accomplished with a disk wheel. The great difficulty with the cup wheel is that it presents so much surface that it glazes very rapidly, heating the work, and if care is not used the temper of the teeth will be drawn.

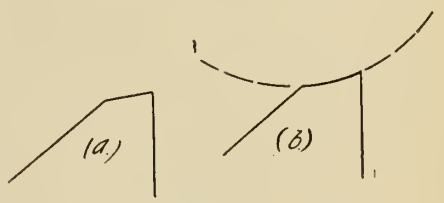

Fig 18.

Attention is here called to the direction of rotation of both the wheel and cutter, and to the position of the guide finger, figure 17. The finger should always be applied to the radial face of the cutter and the wheel should revolve in the direction which will have a tendency to hold the cutter against the finger. A divergence from this rule will endanger the operation, and should the cutter slip considerable damage to the cutter may result.

The motion of the cutter before the wheel is produced in two ways. First, in most machines the cutters are placed on an arbor whenever possible, or swung on centres when made on a shank, the centres being placed on a reciprocating table which is moved in a direction parallel to the face of the cutter ;

second, the cutter is placed on a stationary bar upon which it slides before the wheel. Obviously only those cutters which have holes are adapted to this

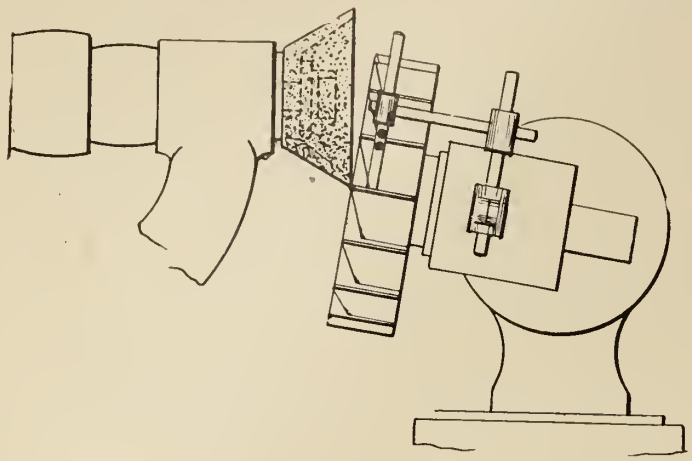

Fig 19

method. This latter method is the more sensitive of the two, and consequently the more expeditious. The bars upon which the cutters are made to slide are hardened and ground, and bushings are

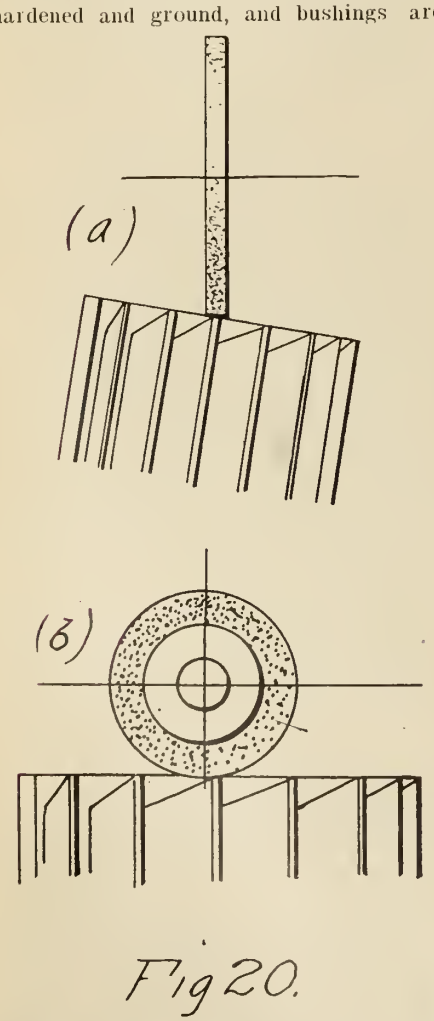

Fig 20.

made to fit different sized holes. These bushings are lapped out smooth and no oil is used on the bar. The bar should be provided with a special groove throughout its entire length, into which the emery dust may escape.

The disk wheel is used to sharpen formed cutters. The method used is shown in figure 21. The cutter rests on a bar and is moved back and forth past the wheel as shown. Very thin cutters, such as gear cutters, may be ground by placing them on a rest and feeding them in toward the wheel centre; but this method is not to be recommended since there is no assurance that the face will be ground radially, which must be done in order that the form of the tooth may be preserved. Care should also be taken that the rest is set parallel with the wheel centre, or else the face ground will not be at right angles to the sides of the cutter, which of course is necessary.

Speed and Choice of Wheels.

The choice of the wheel and the speed at which it should run vary with the circumstances. For cutter grinding the wheels should run at between 4,000 and 6,000 feet per minute, and a comparatively coarse grade of wheel should be used. Should too fine a grade be used it will fill up with chips and glaze over to such an extent that much difficulty will be experienced in the operation. The softer grades of wheels are more suited for grinding hardened steel. A wheel that fills up and glazes over will have a very great tendency to heat the work, which may occur to such an extent in some cases as to draw the temper.

Care of Wheels, and Feeding Work.

The wheels should be kept in good condition, and should be kept running true, which is accomplished by truing the wheel off with a dresser. These dressers are commonly made of disks, but the best results are obtained by using a diamond, the diamond being held in the end of a holder of convenient form. The cutting face should be kept as narrow as possible consistent with the strength of wheel, since a wide face has a greater tendency to heat the work than a narrow one.

The depth of a cut taken with a wheel should not be too great, as the pressure necessary to remove a very deep chip is excessive and is liable to spring the work, besides badly heating it.

In feeding the cutter before the wheel the feed should be held at the same rate for all the teeth as far as is possible, because if one tooth is fed past the wheel at a greater rate of speed than the others, the cutting face of this tooth will be at a greater distance from the centre, and will consequently remove more metal than the others, and very rough work will result.

Care of Cutters.

It is much more economical to keep the cutters sharp by repeated grinding than to leave them in a dull condition, because dull cutters wear very rapidly if kept in use. This is especially true in regard to formed cutters, because when the cutting edge becomes badly worn, the amount of clearance being so small, it is necessary to grind away a consid-

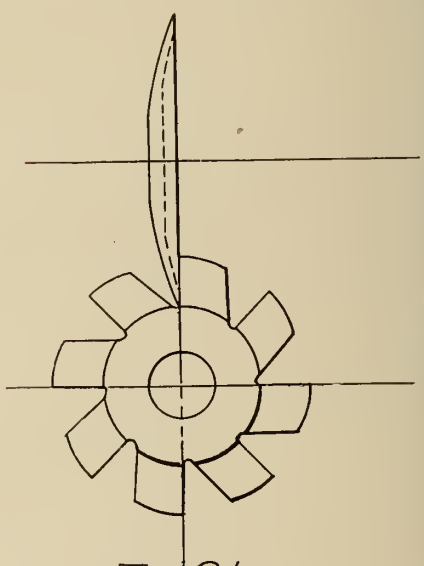

Fig 21.

erable portion of the face in order to restore the cutting edge. A cutter that is yet comparatively sharp requires very little grinding to sharpen it, and in this way the best results are obtained with the cutter.

There is probably no way in which a cutter is worn so much as in the practice of taking chips with very fine feeds, and chips so light that the cutter can not get under the surface to take hold of the metal, but has to grind off what it can, straining the arbor and machine far more than would a heavy chip, but to no productive purpose. I have mentioned this matter before to readers of Canadian Machinery, but cannot help emphasizing the fact at every opportunity.

Foundry Practice

MODERN IDEAS FOR THE TRADE.

UNIFORM PRACTICE IN FOUNDRY COST FINDING*

By Kenneth Falconer, Montreal, Que.

TO a certain extent I have accepted your secretary's kind invitation to submit a paper to this convention, and to meet in Cleveland the members of the American Foundrymen's Association under false pretenses, for I am neither an American nor a foundryman. These are misfortunes not faults, which I have to some degree overcome, inasmuch as I have the happiness of having an American wife, and the honor of belonging to the American Foundrymen's Association.

The saying that this is an age of "Specialism" is so common as hardly to be worthy of repetition : that it is an age of standardization of methods—of uniform practice—is equally true, though less frequently stated, and perhaps less generally recognized. The existence and growth of associations of those whose work is similar, or whose interests lie in the same direction is in itself an evidence of this : the logical influence of conventions and meetings of such organizations is towards the general adoption of certain principles, the details of their application being subject to individnal conditions and special requirements. As a result of this convention, different members of this association will, during the coming year, be thinking along similar lines, and adopting, in relation to certain features of their business, similar methods with similar ends in view. It may be possible that some degree of uniformity in cost finding methods in different foundries, and in different plants, whose interests are represented here, would result in general good to the trade. The Steel Founders Society of America have, in the recent past, taken up the subject of "Uniform Methods of Cost Finding for Steel Foundries," and those connected with each line of manufacture, or interested in each branch of industry might possibly consider with benefit the advisability of adopting in their different plants methods of cost finding uniform in so far as general principles are concerned, though possibly widely different in details.

*Read before American Foundrymen's Association, Cleveland, June, 1906.

It goes without saying that no system of cost finding can be designed for the manufacture of castings, or for any other business, applicable in all its details to the plants of competing concerns, but the fact remains that similar principles of cost finding, and the broad application of such principles on similar lines, are applicable in all plants manufacturing similar products, and the resulting influence will make for healthy and normal competition, instead of disastrous rivalry.

To standardize methods of costing and estimating in any industry, a clear understanding of the term "Costs" as applied to manufactured product is essential. To some it means only the value of material and labor consumed, to others it includes expenses incurred in running the plant, while the elect take it to cover in addition all expenses of selling and of administration, and in some cases all possible outlays.

While the division of each plant or organization into its component departments might involve in each instance different definitions of departments and limitations of authority, it would make for more intelligent estimating for competitive purposes, if competing plants were departmentalized in the first instance on similar general lines. All the departments of a productive organization are, naturally, capable of classification as manufacturing, selling or administration, this logically resulting in three costs, which may be defined as cost manufactured, cost sold and final cost. If all bids and tenders were based on accurate knowledge of these three costs, members of the trade interested would, to a greater extent than at present, have only fair and legitimate competition to meet. The methods of obtaining records of labor and material costs would necessarily be determined in each plant by the individual judgment of those in control, as would also all other details of cost work. Cost of material is practically governed by market conditions, and cost of labor too frequently regulated by forces beyond the control of the management, and there is, consequently, in these two factors but limited opportunity for cost reduction. In expense cost of product lies the greatest opportunity of effecting economies, and it is this factor of cost which should be thoroughly analyzed and closely watched so as to keep it down to the lowest possible figure. To do this, the amount of each expenditure going to form the aggregate expense cost of product should be known very promptly after the close of each period—week or month, as the case may be—and should be subject to constant comparison, not only with similar records of preceding expenditures, but also to items of related interest.

The basis on which manufacturing expenses are distributed on cost of product is a point regarding which, in Canada at least, there is little uniformity of practice amongst foundrymen. Some distribute such expenses according to the weight of output, some on the labor and material cost of product, some on the ratio of manufacturing expenses to the value of productive labor, and others again on the ratio of manufacturing expenses to the number of productive hours worked, irrespective of the wage price per hour. Competitive bids based on cost records secured by such widely different methods constitute unsatisfactory competition, are demoralizing to the trade interested, and are a strong influence towards creating unsatisfactory and unstable market conditions.

Uniform accounting methods are perhaps more important than would appear at first sight—not so much uniformity as between different plants as uniform methods to be used continuously in each plant. If a foundryman or manufacturer distributes his expenses during five different years according to the five different plans, previously mentioned, the value of his records of costs and results for those years is largely destroyed. This is not intended as an argument that present methods should be continued, simply because "we have always done it that way," it is meant as a plea for a very thorough consideration of the subject, and a determination in view of the conditions of each plant and business of what is the right and logical method of distributing expenses on product, of obtaining costs, and of carrying the results into the books.

MODERN FOUNDRY CONSTRUCTION *

By David Townsend, Pa.

I PRESUME there are still a great many old-fashioned foundries around the country districts to-day, but compressed air, electricity and the traveling crane have revolutionized foundry methods to such an extent that it is a very poor plant indeed that cannot show some advance towards the perfection which we all desire and think we know.

Let us consider for a short time the various points which are absolutely essential to a thoroughly modern shop. Where a new foundry building is under consideration and its size or capacity has been fixed upon, the other essential parts are: Materials of construction, movements of production, storage of raw and finished materials, light, power and heat.

Taking it for granted that there are no complications, as to size or location of site, the first thing to be considered is proposed amount and kind of output and the floor space which it will occupy. This ranges all the way from 5 to 15 pounds per day of 10 hours for each square foot of actual molding space occupied, according to the product to be made. This, of course, does not include any core room, core oven or cupola space.

Strange as it may seem, the heavier the work, the less pounds output per square foot per day can be produced, because on large pieces molded in the floor, such as engine beds, lathe beds, etc., a long time is taken to mold and prepare for pouring, and to subsequently cool, and, although the weight may be considerable, the average in pounds per foot per day is very small. The largest output is obtained by molding machines and snap flask work, where continuous or multiple pouring is practiced, and the molder does nothing but mold, his heat being poured off almost as made, by an expert gang of men who do nothing else.

* A paper read before the Philadelphia Foundry Foremen.

The class of work to be made and the daily output having been determined, the size of building and materials of construction are the next important items to consider, and here is where the question of cost first appears as an important factor. We all naturally want the very best for the least money, but when the range of cost runs from 80 cents per square foot of floor space covered up to $1.50 per square foot, there is considerable room for a choice. At one end of this range we have the old brick or skeleton iron frame structure with wooden sides and roof, and at the other, an absolutely fire proof structure made of steel and concrete throughout.

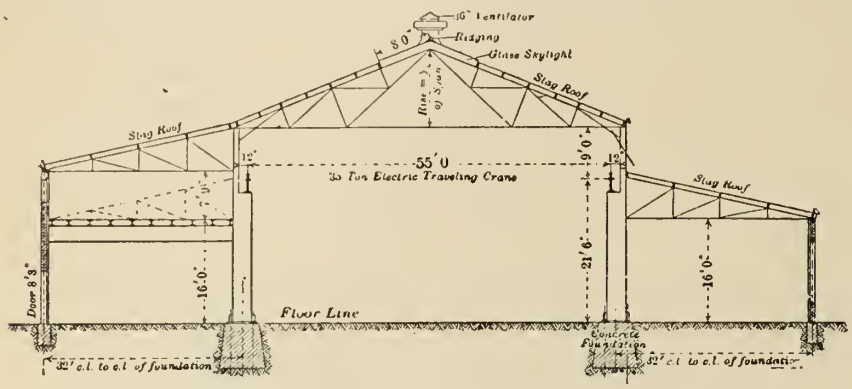

FIG. 1.—CROSS SECTION OF STEEL FRAME FOUNDRY BUILDING.

I have developed in my own practice a construction which is practically fireproof, except the roof, and have had an experience with the same from the insurance standpoint; the worst that happened being a partial destruction of the roof and all of the glass skylight which was cracked by the heat. This fire was caused by the exploding of a mold for a 30-ton anvil block, which shot several tons of liquid iron against the underside of the roof and caused a fire which damaged the glass principally as stated.

My construction consists primarily of a steel frame, self-contained structure with nine-inch brick or four-inch concrete curtain walls, ordinary glazed sash, and a steel truss with a wood roof covered with four-ply slag and containing glass skylights its whole length. A cross section through the building is shown in Fig. 1.

This construction is being generally adopted for iron foundries in this country, and, of course, has many advantages and some disadvantages; the latter connected principally with the subject of storage and movement of raw materials and general arrangement of storage yard for iron and fuel.

The arrangement most favored in Europe is one which has the cupolas, furnaces, core rooms and sand storage in the centre of the building as shown in Fig. 2. This style of construction has also been adopted very largely in this country for steel foundries. In these plants, one whole side or floor is used for molding; the molds then being put into the core ovens and when dried are taken out on the other side onto the casting and cleaning floor. The core ovens are in the centre bay and a very large sand storage space is obtained by utilizing the top of them for bins. This brings the new sand inside the foundry and in a position where it can be utilized for tempering or for new molds, without handling. In steel foundries, the furnaces are put on the outside of the general foundry construction, but where this type is used for iron foundries, the cupolas are placed in the centre bay with spouts to deliver iron into either side and the space over the core ovens, core rooms, store room, etc., can be used for storage of sand, coke and iron.

Aside from a proper selection of materials for construction and general arrangement, the most important thing to be provided is good light. We have all suffered in various degrees from the want of good light, and know the inconvenience of always having a hot, smoking oil lamp under our noses to see into dark corners of the mold.

To my mind no other item about a foundry will give the financial return that is to be had from a strong natural light. Aside from the fact that daylight costs nothing and artificial light of any kind is expensive, the cheerfulness of disposition and general temper of a shop are very much improved by proper natural illumination.

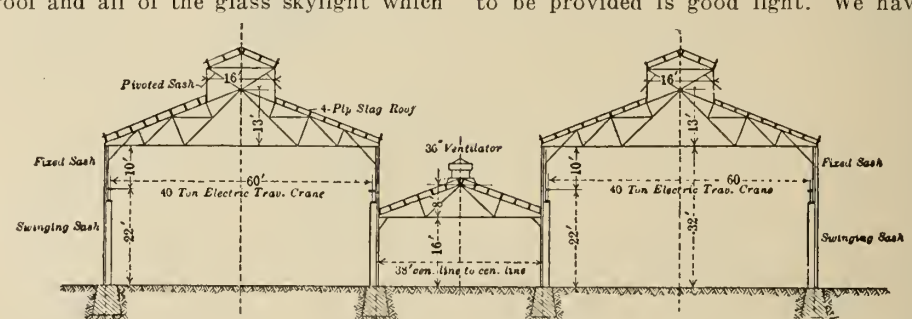

FIG. 2.—CROSS SECTION OF FOUNDRY BUILDING USED IN EUROPEAN PRACTICE.

MANUFACTURE OF SOIL PIPE AND FITTINGS

Paper Prepared for the Recent Convention of the American Foundrymen's Association by T. J. Best, Montreal.

THE first requisite in the art of making soil pipes and fittings is a well lighted and ventilated foundry. A shop 86x200 feet will be required for a melt of from 20 to 25 tons per day. Light should come from each side and end, also from one or two monitors running nearly the full length of the roof, with pivoted sash duly placed in them. This will make the centre of the shop nearly as light as at the sides. Perfect ventilation will also be assured. The mill, or cleaning, chipping, and oiling rooms, should be at one end of the foundry, separated by a fireproof wall. The mill room should be large enough for 12 to 16 ordinary mills. If, however, exhaust mills are used, a smaller number will answer.

The Method of Molding.

In the centre portions of the pipe floors, at proper distances apart from each other, there should be set and secured firmly iron rails or small I beams, on which to rest mold boxes and machines. In the centre of the passage between floors tee irons should be suspended from the roof, well stayed, and high enough to allow men to walk beneath them. This is for the purpose of resting the mold boxes against them while on end, after the heat has been poured and the boxes shaken out at night. A good supply of trucks is essential to carry out the castings either by night or day, as may be desired. In any case a few men with good trucks can clean up the foundry very quickly.

The machines or follow boards, on which the pipes are made, as well as sizes and weights of mold boxes, vary in different establishments. Some foundries use machines run by steam, others use hydraulic power or compressed air, to press the mold. The general way, however, is to do the work by hand ramming. The pattern should be made very accurately and be well fitted. I have seen patterns made with rather more than half circle and finished with files and emery cloth. This is a tedious and crude way. By all means see that good sound castings are provided, and turn them up. If you have a universal grinder, finish your patterns by grinding them. Too much care cannot be given the machines and patterns. The plates and stops for mold boxes must be accurate. The mechanism for raising and lowering patterns should be as simple as possible, with the precaution that the patterns should be raised vertically only. I have seen cam motions that would lift patterns slightly sidewise, while others would lift toward one end. This is liable to make an overlap one way or the other. Patterns for 2-inch and 3-inch pipe are made two in a box. In many places the 4-inch are also made two in a box, but with a single pattern and a light box one man can make 35 and in many cases 45 4-inch pipes a day, if two men are working together. Another advantage is that when one man rams the mold it will be uniform. Two men working on a mold will not ram up the same, and the result is an uneven casting. Good results are obtained with one man on a floor and the understanding that the men lift for each other, and also help set the cores.

The light pipes should be made in the centre of the shop, so that the hottest iron may be poured there. The heavier material can be cast at the ends of the foundry, and the metal taken there in small bull ladles holding 500 to 600 pounds, on an overhead system. This will save a lot of hard work. The fitting floors can all be stationed at one side of the foundry, or in any other part not taken up by pipe floors.

Better Pipe and Fittings Demanded.

We have to turn out a better grade of pipe and fittings than formerly. I do not know how it is with you in the United States, but we in Canada are forbidden to use the broad mantle of charity that covers a multitude of sins —that is to say, the hot tar pot. Our pipes and fittings must be oiled, or dipped into a mixture of oil and benzine. The oiling room should have two or more tanks in which all pipes and fittings can be immersed; also suitable drainage racks on which pipes can be stood on end, the surplus oil running back into the tanks. The fittings are dipped and thrown on a drainage rack. Racks about 2 feet apart and as long as convenient may be set up, bars of ¾-inch pipe being placed about every 2 feet to form pockets or divisions. This will prevent the oiled pipe from falling over, and by the time the rack is filled the first pipes will be ready to go to the shipping room. Some foundries dip their pipes on the side, while others dip on end. This may be carried out just as is desired or convenient.

Pipe Cores.

There are various ways of making cores. They are now, however, usually made of green sand. Some foundries do their ramming by hand, others by means of squeezers, and still others in vertical core boxes made in three parts. In the boxes the back part is held stationary and the other two parts are hinged to it. The core bar is whetted and put into position. Then a tube, having a screw with a coarse thread at the lower end, is lowered over the core bar, a small quantity of sand thrown in and the screw revolved by machinery. A man throws the sand into the hopper and as the screw revolves it packs the core, which raises itself at the same time. There are balance weights on a chain which regulate the pressure put on the sand in the box. This machine is very good, but also very expensive, and is being superseded by the horizontal machine. There is a great variety of these machines. For instance, I have seen a long riddle suspended so as to sift the sand down on a core bar. The noise of the mechanism could be heard a long way off and was very annoying. Others are made with a shaft on which a number of wheels are made to revolve and thus shake the sand on the bars. Whatever the style, the bar revolves and the sand falls on it from above. As the sand impinges it is rotated against the steel knife provided and shaped for the purpose. From 500 to 600 cores can be made and used each day on a good machine, in sizes from 2 to 6 inches in diameter. The change from one size to another can be made in a minute.

Cupola and Melting.

We read so much about high and low melting ratios. The trouble is that we do not take time to think deeply enough about our business. For instance, not long ago I read of a foundry having a 52-inch cupola melting about 20,000 pounds a day at a ratio of 6 to 1. They could not understand why others were getting better results. I do not pretend to know as much about what I have given here as I ought to, yet I do say that if we want to be successful we must proportion things properly. Therefore for a plant such as I have described in this paper, in which from 20 to 25 tons a day are cast, the cupola should measure about 45 inches inside the lining, which should be double brick. At least six tuyeres 4 by 12 inches should be arranged for. The main blast pipe should be 18 inches diameter, and if convenient let down each side of the cupola in two 13-inch pipes. The blower, which I prefer to have a positive one, should be as near the cupola as convenient. In this way from 3,500 to 4,000 cubic feet of air will be furnished each ton of iron melted and there will be no difficulty in getting a 10 to 1 ratio. It must be borne in mind, however, that it is as important to look after the coke as any other part of the melting scheme, and suitable dry sheds should be provided for it as well as the sand.

For pipe and fittings the metal required should be both hot and clean. In order to have this let the melt be as continuous as possible.

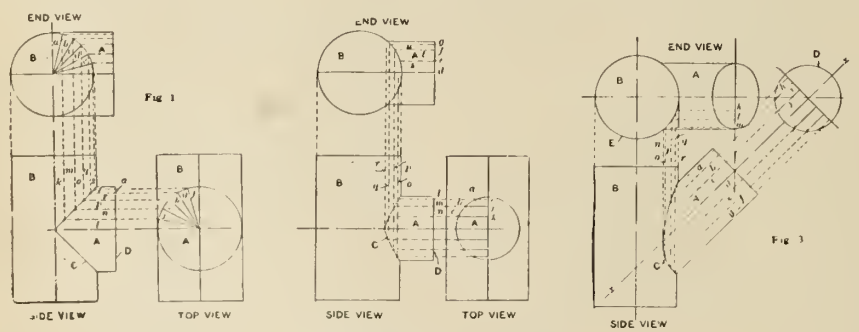
Mechanical Reviews

OPINIONS AND STUDIES WORTH NOTING

FITTING CURVED WORK.

ANYONE having but a limited knowledge of drafting can do this little trick very easy and after a little practice find it a time saver, doing away with a lot of guessing, superfluous cutting and the dulling of tools.

Fig. 1 is a tee, (B) is the main body and (A) is the piece to be fitted thereon. The object is to mark (A) to be cut where it joins (B). To do this accurately the following method will be found practical. Let us suppose there is a full size drawing of this at hand. Lay a piece of tracing paper on the drawing. Trace the outline of the three views, step off the divisions and project lines as further directed. Or the patternmaker can prepare a drawing, three views will be necessary. One quarter of the circle of (B) in the end view is divided off into any number of equal divisions, (a, b, c, d, and e). A quarter of the top view is similarly divided off as at (f, g, h, i, and j). From the points of these divisions lines are projected on to the side view, as shown by the dotted line (k, l, m, n, o, p), etc., and where these lines meet, as denoted by the dotes, is in each case a point in the line of junction of the two cylinders (A) and (B).



The Fitting of Curved Wood.

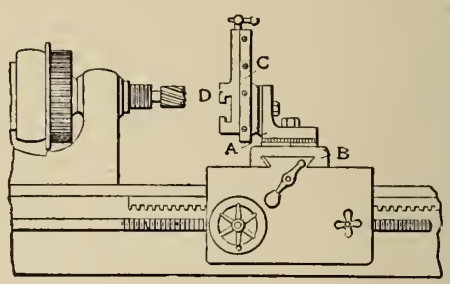
Next take the cylinder (A) and step off as many points on its circumference at (f, g, h, i, j) as there are on (B). It must be stated that the more points you step off the more points you will have in the curve at the junction (C). Draw parallel lines (t, r, p, n and l) from end to end as in the side view. Mark the distance beginning at (a) to dot which is line (t), then line (r, p, n, l) from line (D) and you have points on Cylinder (A) giving the correct curve, which can, if (A) is of large diameter, be cut out with a compass-saw, providing it is staved up in the usual manner, and then trimmed to a perfect joint with a spoke shave.

Fig. 2 represents a tee in which (A) is of less diameter than (B), hence the two join in a curve, which is found somewhat differently than is the case in Fig. 1. First the three views are drawn in outline as before. The top view is stepped off as shown at (a, b, c) and lines (i, j, k) drawn. The length of line (i) is taken with the dividers and with (d) as a centre transferred to (e) in the end view, (j) and (k) are taken the same way, and from these points lines are projected on (A) as shown at (s, t, u) and where they intersect with the circle of (B) is the point to drop (o, p, q, r) down to the side view. Where they meet (1, m, n) are the points in the curve at the junction of (A) and (B) as shown at (C). Part of pattern (A) is divided as in Fig. 1 and the parallel lines drawn on the surface. Then the lengths of these lines are measured from line (D) to the dots, the curve drawn and it is ready to be cut.

Fig. 3 shows the part (A) at an angle of 45 degrees. The end and side views are drawn and the circle (D) is drawn on centre line (x x). Half of this circle (D) is stepped off equally and from the points of division lines are projected to (A) in the side view as at (a, b, e, d, e, f, g). The lengths of lines (h, i, j) are transferred to the end view at (k, l, m) and projected to circle (E), in the end view, and from their junction on circle (E) drop lines to side view as at (n, o, p, q, r). When these lines meet (a, b, e, d, e, f, g) are points of the curve at the junction of (A) and (B) and the curve (C) is easily drawn through the points of intercection. The intersecting parts of (A) are treated the same as in Figs. 1 and 2. If everything has been laid out as directed a perfect fit is secured.—Wood Craft.

MILLING IN THE LATHE.

SOME years ago, having occasion to do quite a little light, plain milling in a shop whose principal "equipment" consisted of one good 1-4 inch lathe, with compound rest, I got up the rig shown in the enclosed sketch. This



Cheap Milling Device for Lathe.

rig is so simple and obvious that it hardly seems possible that it can be new; yet I have never run across it in my travels, and have several times turned in the suggestion in small shops where there was no miller, and it has always been warmly welcomed and given good service on light work.

Its cardinal virtue is its cheapness and simplicity, for aside from the vise, which may often be on hand, the whole cost for any lathe having a compound rest should not exceed five dollars. Another point in its favor over some of the clumsy lathe-milling makeshifts I have seen, is the quickness with which it can be set up and removed without in any way interfering with the regular uses of the lathe.

All there is to it is to get out a pattern for an angle casting (B), both faces of which are circular, the distance from the base to the centre of the vertical face being the height from the top of the graduated circle (tool-block bearing) on the cross-slide to the centre of the lathe spindle. The diameter of the faces on the angle piece should be the same as the inside of the graduated circle on the slide for the bottom face and about 1-2 inch greater for the vertical face, in order that the latter may be chamfered for about 1-4 inch and marked off in degrees if desired. After both faces are

turned up bolt it to the cross-slide (B) in place of the usual tool-post block, with the vertical face accurately at right angles to the lathe ways, and make a setting mark to correspond with zero on the graduated circle. This should be carefully done that future settings may be quickly and positively made. The compound rest (C) is now bolted to the vertical face, as shown, and a light cut taken—with an end-mill in lathe spindle—across tool-post seat to insure truth, using the cross-feed of the lathe and feeding down at the end of each cut with the compound rest screw until the whole face has been gone over. Any small machine vise may now be bolted to the tool-post seat (D), after which the compound rest should be carefully set, in its new position, so that the travel is exactly vertical and zero marks made for resetting.

It is surprising what a range of light work may be done with this simple rig, an end-mill or two fitting the lathe spindle, and a few cutters to run on an arbor between centres. Longitudinal and cross feeds are provided by the lathe carriage, and vertical feed by the compound rest, while horizontal angular adjustments are gotten by swiveling the angle block on the carriage, and vertical ones by swiveling the compound rest on the block. Naturally, it is not intended for heavy work, but it is something more than a makeshift, and on very light work it is sometimes even handier than a miller, while on experimental and die work it is almost invaluable in a shop without a regular milling machine. In using end mills the base is swiveled at right angles to the lathe bed, as shown, while with cutters on centres it is, of course, swung parallel with bed.

Both cross and longitudinal feeds, geared as fine as possible, may be used if needed, and both screws may be used for indexing; or perhaps it would be more proper to say dividing. With a little ingenuity its applications are quite varied. I once cut several small sections of rack, using a cutter between centres and indexing by the lead screw, and at another time did a very good job of drilling and reaming on some small plates with rows of 1-8 inch holes requiring accurate spacing and perfect alinement. A bushing held in the centre rest served to steady the point of the drill and start the reamer fair. In this case I used the cross-feed screw, with a micrometer collar for indexing. The lathe was new and the screw was not worn, and the results were entirely satisfactory. There were several of these plates to do, and as they had to be right, the cost of the rig was saved on this one job alone.—M. C. Conwell, in American Machinist.

BANKING A CUPOLA.

BANKING a cupola is so unusual an occurance that a history of the incident, as it occurred with us recently, may perhaps be read with interest and the details of the experience may include information of value to some of your readers.

To a foundry man, the labor, loss, danger and annoyance incident to dropping the cupola bottom, particularly when the cupola is pretty well loaded, are too familiar to require rehearsing here, and they were what determined us to stop the machinery and to take our chances on banking the cupola and running heat off next morning after the necessary repairs would have been made.

Our outfit in operation was a No. 9 Whiting cupola lined down to 58 inches. The bottom of tuyeres 12 inches above bottom, lower tuyeres only in use. No. 5 Baker positive pressure blower supplied blast varying in pressure from four to seven ounces.

This pressure being insufficient for proper melting of iron, at the rate desired, a No. 9 Sturtevant fan was installed. It so happened that the position of the Baker blower was near the foundation fot the new blower, so that a length of pipe made to run from the Baker to a point where the mouth of the new fan was to come made a return to the use of the old blower possible by the removal of the new blower from its foundation and the placing of the above mentioned pipe.

The way matters arranged themselves there was no time to test out the new installation before time to start blast. In starting the precaution was taken to keep the blast gate closed so as not to fan up the fire.

Trouble came with the start and five-thirty came around and the machinery was still out of order. Upon consultation it was determined to bank the cupola.

The cupola was charged with 2,200 pounhs of coke on bed and filled to the doors 17 feet up. The fire having been lighted at 11.55 in the morning and the banking was begun at 5.30, the cupola had been five hours and thirty minutes under draft.

The men were sent home and told to report at seven in the morning. The banking was accomplished by filling in the tuyeres with fresh coke further with rags and pounded tight with molding sand.

The top was packed in the same way with rags and molding sand forming a cover about six inches thick.

While the cupola was being banked the fan was removed and pipe connected to the old blower.

In the morning tuyeres and top were cleaned off and blast put on at 7.30, the first iron appearing fifteen minutes later. The first two hundred pounds were used for drying ladles, the next two hundred pounds for pouring grates and after that the iron ran white hot throughout the heat.

Hoping this recital may enable others to encounter a similar difficulty with more confidence than we could feel with this, our first, experience.—The Foundry.

PRACTICAL DATA ON SUCTION GAS PRODUCERS.

SOME experiments were recently carried out at Glasgow, with a view of demonstrating the practical qualities of the suction gas producer, especially as regards continuous running at full and light loads, says a writer in the Engineer. Six sets of plant were exhibited, of which four were fully tested, of about 20 brake horse-power and four of 8 brake horse-power. The following are the average data of the first six: Cost of gas plant, $420 (from $350 to $500); weight of plant, 3,400 lbs. (2,800 to 5,000); cost of engine, $600 ($530 to $630); weight of engine, 7,200 lbs. (5,800 to 8,400); speed, 205 revolutions a minute (190 to 220); total floor space occupied, 224½ square feet (144 to 288).

It will be seen that the variations were wide, except in the cost and speed of the engines. It was found that 15 minutes sufficed to get up a full working load from cold.

The four large sets tested for 8 or 10 hours gave the following results: Mean effective pressure, 78 lbs. to square inch; mechanical efficiency, 84 per cent.; coal per brake horse-power, 0.83 lb. at full load. The corresponding figures at half load were 78 lbs. to square inch., 71.2 per cent. and 0.98 lb.

In the case of the 8 brake horse-power sets, the average cost of the gas plant was $316; weight, 2,130 lbs.; cost of engine, $390; weight, 3,750 lbs.; speed, 220 to 230 revolutions per minute, and the total space occupied, 208 square feet. Running on full load for 10 hours, three of these gave a mean effective pressure of 79.1 lbs. to square inch; mechanical efficiency, 81.4 per cent.; and coal consumption a brake horse-power hour, 1.10 lbs. On half load the figures were 77.7 lbs., 69 per cent. and 1.11 lbs. of coal.

By the committee in charge of the tests the results were considered highly satisfactory. The cost of fuel a brake horse-power was about 0.1 per cent., a remarkably low figure, but to this, of course, must be added the cost of interest and depreciation and labor.—Gas Power.

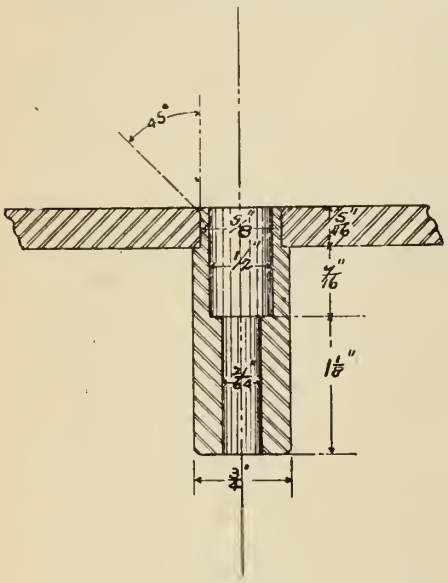
PUNCH AND DIE STRIPPERS.

ONE of the principal operations of a combination punch and die is the methods and means for stripping the scrap and punching readily from the punch and die, and at the same time be able to adjust the throw and stripper without disturbing the setting of the die. It will be readily seen from the sketch that the punch may be placed in



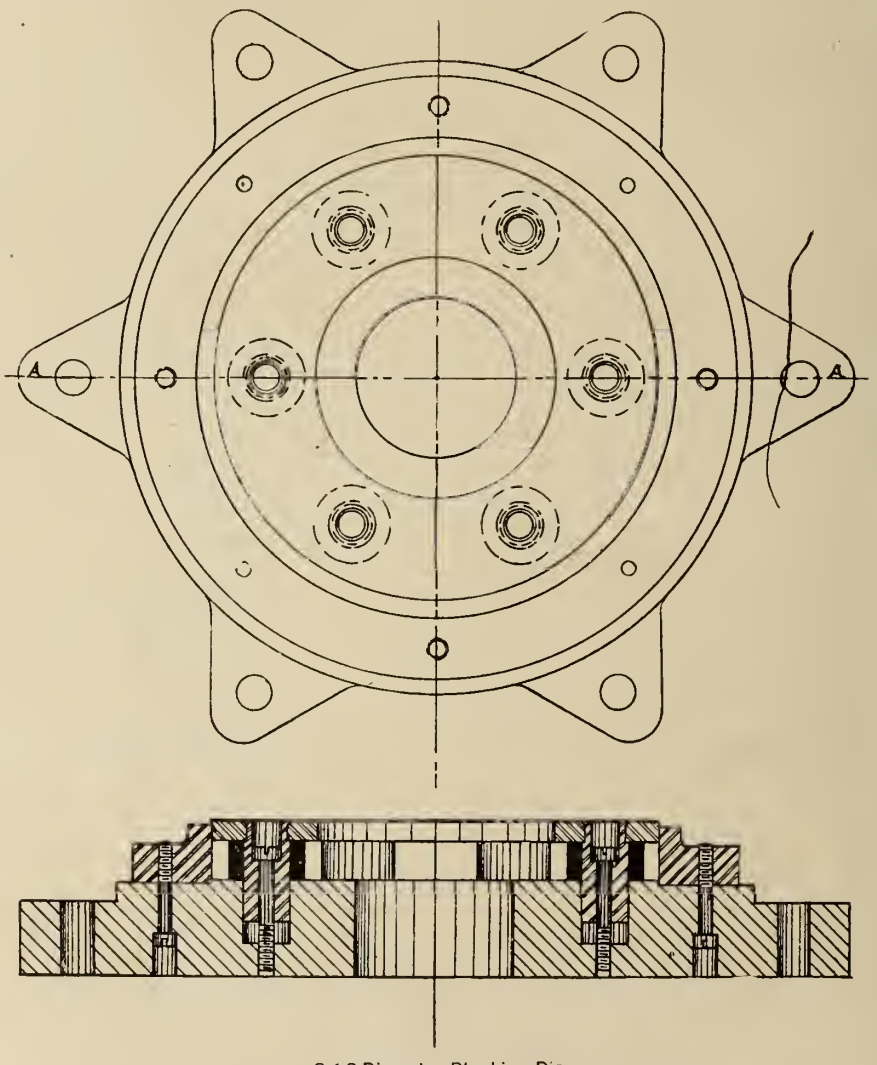
Details of Guide.

the die and be supported by parallel the required distance in the die, and placed in the press and set. The throw-out is dropped in and screwed down, and then the stripper is placed over the punch and screwed up until its face exceeds that of the punch 3-32 in. or 1-16 in. at least. We use a ratchet screwdriver for putting in the screws, but a bent screwdriver will give the same result. It will be found that it is easier to set the die and that there is practically no danger of having large combination dies injured through setting. If the stroke of the press is too small to allow the throw-out, and stripper room to get in, the throw-out may be screwed down below the cutting edge of the die, and the punch stripper screwed up the same way, then the punch is placed in the die resting on the throw-out. After the die is set the throw-out and stripper are adjusted to their proper height above the cutting edge of the punch and die. The sketch shows a view at (Á A) showing a detailed view of the guides with the rubber in position. It will be readily seen that so soon as the punch strikes the throw-out it presses it down into the die, it sliding over the screws which remain stationary in the die block, while the same motion takes place with the punch stripper. Springs may be employed in place of rubber with the same result. The guide is made from cold-rolled steel, and has 1-64 in. clearance in the hole.

F. LAUER, Toronto.

EQUIPMENT FOR MACHINE TOOLS.

THE writer has been interested in the many various suggestions which have appeared in your paper pertaining to the rapid and economical methods of machining different pieces of work, which are to be put through in large quantities. All modern shop managers recognize the importance, in fact, the necessity, of using special jigs, tools and fixtures for this work. One reading the various mechanical papers, and not fully acquainted with shop practice, might come to the conclusion from the numerous special tools described therein, that nearly all machineshop work is now done in this manner. While this is the case to a very great extent, it is probably not an exaggeration to say that nine-tenths of the work done, even in those shops which are turning out duplicate pieces, such as engines, electrical machinery, etc., is still being done in the old-fashioned way of clamping each piece separately in the machine and machining it to the size with a single cutting tool, no special clamp fixtures being practical for the greater part of this work. It is, therefore, essential that every accessory which can be added to these machines to facilitate the rapid clamping of this work should be supplied.



8 1-2 Diameter-Blanking-Die.

It is, however, a fact very noticeable to every one who has had experience,

that in most of our manufacturing plants these very necessary appliances are lacking. The average superintendent is keenly alive to the possibilities of the use of our rapid cutting or high speed steels, but there is just as much to be gained by the rapid clamping, progressive of our large manufacturing establishments this feature is receiving its full share of attention, and herewith are produced some illustrations which were taken in one of our large electrical works, where the matter has been gone into thoroughly, and every

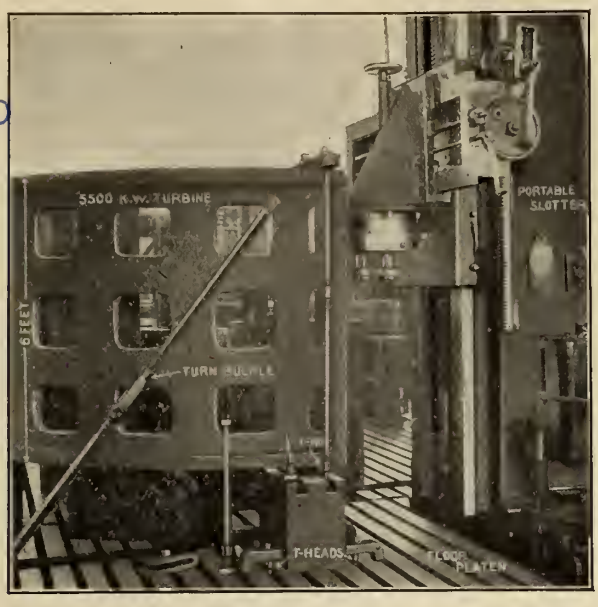

FIG. 1—Floor Platen.

setting and getting ready to do a job, as there is doing it after the machine is started. There is, perhaps, nothing which so discourages the operator of a machine tool, who really wants to turn out all the work possible, as, when setting up his work, not to be able to find the proper bolts, clamps, washers, nuts, wrenches, clutch jaws, drivers, dogs, etc. These seem such small and unimportant items that they really receive little or no attention from the foreman, in spite of the fact that they are absolutely necessary to the rapid turning out of work. It is, however, encouraging to note that among the more convenience which tends to make the work easier is supplied. As will be noticed, there is possibly nothing new about any of these tools, except that they are supplied in proper quantities and kept at each machine in a box by themselves.

Illustration No. 1 represents a large floor platen, upon which the large work is clamped, and portable machines, electrically driven, are brought to the work to do the different operations of slotting, milling, drilling, etc. It will be noticed that there is not any wood used on any of these machines. Long turn-buckles with forked ends are used for bracing or driving, and these can be bought all ready for use, except that the ends must be split. Illustration No. 2, of the boring mill, shows a handy device for blocking under the outer end of clamp. These heel blocks are about 6 in. by 6 in. by 2 in. wide, $\frac{3}{8}$ in. thick of metal, and, as can readily be seen, they can be used on work 2 in., 4 in. and 6 in., and by putting two together, as shown in cut, 8 in. high. By adding a third block on top of the second they can step on up indefinitely. This does away with wood and makes a much more rigid block. Illustration No. 3 of the rotary planer illustrates very clearly the T-heads, which are used throughout the shop in place of bolts. These T-heads are tapped to receive studs. From one to two dozen of the heads are placed at each machine. It is then an easy matter to make studs in the bolt cutter of all different lengths to screw into them, these T-heads being so shaped as not to require the cleaning of slots after each job. They can be placed anywhere desired after the work is set on the machine. The ease and rapidity with which the studs can be made insures a plentiful supply always being on hand when desired. It has been found through actual experience that the adoption of these fixtures has increased the output almost as much as did the use of the high-speed steels, and I believe the time is not far distant when every successful machine shop will have to give more attention to these really cheap, but altogether indispensable tools, not only on account of the increased output which it means to the shop, but because these conveniences will be appreciated by the mechanic more than any other improvement which can be put in at even far greater expense.

CANADIAN BUFFALO FORGE TURBINE PUMPS.

IN the July issue of Canadian Machinery was given a complete description of the construction of the new turbine pumps with balanced impellers, to be manufactured in Canada by the Canadian Buffalo Forge Co., Montreal. The operation and efficiency of these pumps as demonstrated in two tests made by the Buffalo Steam Pump Co., the originators of the turbine pumps, will be of interest.

The makers claim that these pumps have been built successfully for very high heads, even in sizes heretofore thought too small for high head work. Pumps in capacities of 400 gals. per minute, and even less, have been operated economically against heads as high as 1,500 ft. Fig. 1 shows an eight-stage pump of capacity of 300 gals. per minute against 1,400 ft. head. This pump, however, really consists of two four-stage pumps in series as shown.

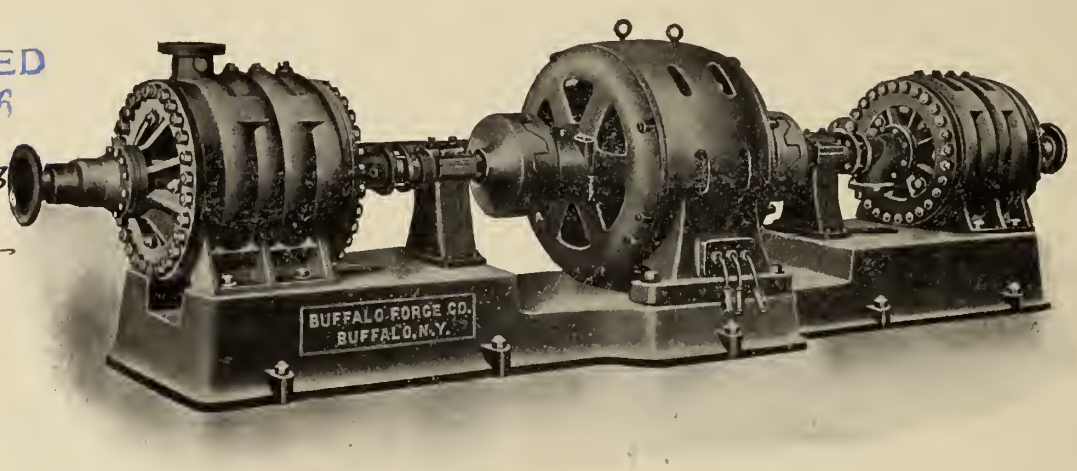

FIG. 1—Eight-Stage Buffalo Turbine Pump.

The results of the two tests made are shown in Figs. 2 and 3. The curves of Fig. 2 refer to a four-stage turbine pump designed to discharge 250 gals. per min. against a head of 630 ft. As the curves show, the specified delivery corresponds very closely both to the point of most efficient working and to the desired delivery-head. The efficiency under this condition is nearly 73 per cent. The pump works at more than 70 per cent. efficiency over the range from 185 to 310 gals. per min. discharge, corresponding to a variation of 90 ft. in head. That is to say, a total variation in head of 14 per cent. of normal produces a variation in discharge amounting to 46 per cent. of normal, with practically the maximum efficiency throughout this range.

An efficiency only slightly lower than that of the preceding pump was shown by a pump tested with the results shown in Fig. 3. The maximum efficiency, 71 per cent., was obtained at a discharge of about 1,000 gals. per min. against 40 ft. head. An efficiency of 70 per cent. or over is maintained through the range from 875 to 1,050 gals. per min., corresponding to a variation of 4.5 ft. in head. In this pump, therefore, a variation in the delivery head by 11 per cent. (of normal) varies the discharge by 17.5 per cent. of normal, while maintaining full efficiency. The latter pump thus has a steeper head-delivery characteristic than that of Fig. 6, although the scales used make it appear that the former has the steeper characteristic. The pump of Fig. 3 is much more nearly a constant-power machine than the other, which is corroborated by the power curves.

The fact that turbine pumps can be designed to have characteristic curves of any desired shape (within limits) is a very important element in their adaptability to different classes of work. For example, a pump intended for certain kinds of drainage work might be required to show a large increase in discharge for a small decrease in head, so as to keep the water at a nearly constant level. This result calls for a very flat head-delivery characteristic. Another pump might be required to have a practically constant load, for example, the full capacity of the driving motor. Such a pump would require its discharge to vary about inversely as the head, giving a characteristic quite different from that of the other case. Most such requirements can be met by careful design coupled with experience in the performance of completed pumps.

The shape of the impeller blade curves is the principal variable. Its relation to the performance of the pump is summarized in a general way by the makers in the following statement:

"The usual design of impeller has the blades turned away from the direction of rotation at a sharp angle, for the reason that this design allows a larger range of head and capacity with less falling off in efficiency. In frequent cases, however, the blades are radial as they approach the periphery of the impeller, or they may even be turned forward in the direction of rotation. This is common in the design of a pump the speed of which is limited by the engine or motor direct-connected to it. Generally speaking, the backward-turned blades are to be used wherever there is danger of overloading the motor by a

decrease in head, and the radial or forward-turned impeller to obtain a greater head at a given speed, or for service which requires the head to be kept up to the normal through a considerable variation in the water quantity delivered, as for city water supply, boiler feeding or condenser circulating pumps. To a certain extent, however, any of these impellers may be so designed as to prevent serious overloading through a considerable range in head."

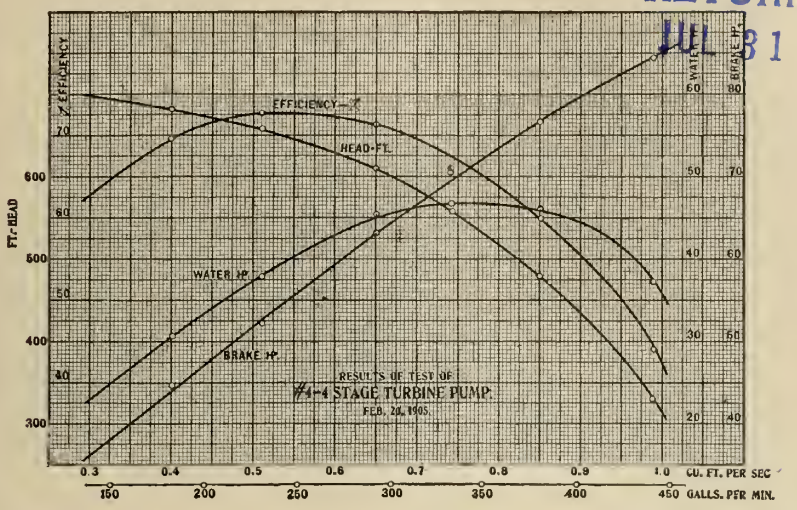

FIG. 2—Curves of Results of Tests on Four-Stage Buffalo Turbine Pump.

These pumps are made in a large range of sizes, 4-in. to 15-in. regular, with corresponding capacities, at a velocity-flow of 10 ft. per sec., of 390 to 5,500 gals. per min., and they are built in larger sizes to order.

These pumps are built single-stage or multi-stage. When built single-stage a double impeller is usually used and a double suction pipe, thereby giving complete balance as regards axial thrust; this refers to pumps with horizontal shaft. However, the method of balancing by thrust-chambers as above described makes it a simple matter to secure accurate balance even with a single impeller. In vertical-shaft pumps the construction is such as will give a resultant upward thrust, to relieve the step-bearing pressure. Single-stage pumps are, usually, limited to 150 ft. head, or less. For higher heads multi-stage pumps are used, allowing from 100 ft. to (in extreme cases) 200 ft. head per stage. The highest degree of compounding represented in any pumps yet built by this company is eight-stage, but there appears to be no reason why more stages can not be used when required.

The truest help we can render to an afflicted man is not to take his burden from him, but to call out his best strength that he may be able to bear the burden.—Phillips Brooks.

STURTEVANT HORIZONTAL ENGINES.

RECENT modifications of the Sturtevant horizontal engines give them all the features desirable for the driving of connected generators. The design provides ample bearing surfaces, abundant lubrication and light strong parts, admitting of very high speed, which is closely regulated by an automatic governor.

Continuous operation for weeks at a time, with but little supervision, and a minimum loss from friction, is secured by completely incasing the accurately finished parts and providing a system of lubrication that positively and continuously supplies the bearings with oil under pressure. An oil pump operated by the crank shaft draws oil from the reservoir and forces it through pipes and internal passages in the moving parts to the main bearings, the crank pin, crosshead pin and guides, valve silde and eccentric. The pressure of about fifteen pounds per square inch maintains a thin film of lubricant between these metal surfaces, and by preventing contact, greatly reduces friction and wear and insures a mechanical efficiency considerably over 90 per cent. The forced lubrication and complete enclosing of parts result in a clean, durable and economical steam engine.

A watershed partition with a bronze stuffing box is inserted in the frame a few inches from the cylinder. Its position and construction allow ready access to the cylinder stuffing box, while preventing the oil in the frame from entering the cylinder on the piston rod, and making it impossible for the water formed in the stuffing box to get into the casing.

Although enclosed for protection from dust and grit, the moving parts are accessible by means of oil-tight plates or covers on the frame and crank case; or if necessary, the entire crank case may be removed. The frame is bolted to a bed plate, or sub-base, of such proportions and weight as insure freedom from vibration.

A double-ported piston valve, perfectly balanced to minimize power expended for operation, regulates the flow of steam to and from the cylinder. Working in a renewable bushing and having cast iron packing rings turned to a perfect fit, it is easily maintained steam tight. The motion for correct steam distribution is given to this valve through a slide and rod by an eccentric attached to a Rites automatic governor contained in the fly wheel. The range of cut-off is from zero to three-quarters stroke, and the speed is so delicately regulated by automatically altering the point of cut-off that the variation from no load to full load is but one and one-half per cent. To reduce condensation, the casting forming the cylinder and valve chest is heavily lagged with magnesia and asbestos of the best quality, held in place by a panelled cast iron

casing of neat design. Damage from water in the cylinder is avoided by placing at each end a relief valve, which may be adjusted to open at any desired pressure. The cylinder is tapped for indicator piping.

For lightness and strength the cast iron piston is cored out and provided with internal ribs; it is fastened to the piston rod, forged from open-hearth steel, by being forced on a taper and then secured by a nut and pin. Cast iron packing rings of best material and perfect fit prevent leakage. The crosshead, moving in guides cast in one piece with the engine frame, is equipped with adjustable cast iron slippers to allow for wear, and provided with a steel crosshead pin flattened on two sides. At the crank-pin end the connecting rod of forged steel has a cast iron box lined with Sturtevant white metal, hammered in and accurately bored; at the crosshead end it is provided with a steel trap, an adjustable key, and a bronze box. The crank pin is extra large. To the webs of the crank shaft, which is forged from a single piece of open-hearth steel, are firmly secured the cast iron counterweights.

Sturtevant HC1 engines are made with interchangeable parts machined to gauge, and in places where extreme accuracy is desired, scraped to surface plate or finished in the grinding machine. The engine and sub-base has a well-finished surface, while the cylinder, crank case, rim and face of fly wheel, etc., are highly polished.

OUR INFLUENCE.

The trade paper is a tremendous selling force. Both through its news and advertising pages it has done more to broaden and develop American industries than all the dailies and all the circulars put together. It has paid its readers dollars on every cent they paid for its subscription. Furthermore, the honest trade paper is here to pay its advertisers in actual business, and if it does not it is not the fault of the medium.—Selling Magazine.

RAILROAD AND CONTRACTORS' SUPPLIES.

AMONG the many firms catering to the extensive trade in railway and contractors' supplies, few have made such rapid progress as the St. Lawrence Supply Co., Montreal. The firm have been in business only a few months, but owing to progressive management they are already in possession of a fine plant and are doing a splendid business in contractors' specialties.

About forty men are now employed in their plant on Ontario street east, and more will be added as soon as the machinery now on order is set up. Already there are a number of machines in operation, including steam hammers, a double head vertical boring mill, a punch and shear and others, all being of Canadian manufacture.

The St. Lawrence Supply Co. manufacture steel and iron supplies for railways and contractors. Their product includes the Morden safety switch, which permits of switching without changing the distance signal; the Bladen oil burner, the invention of a Montrealer, which gives perfect combustion without smoke; the Drake concrete mixer, and the Ross impassable cattle guard.

EXCURSION OF THE ENGINEERS' CLUB.

A VERY enjoyable and profitable day was spent by the Engineers' Club of Toronto in their excursion to Buffalo on July 13. In Buffalo the members of the club were the guests of the Buffalo Chamber of Commerce, and were met at the station by Mr. Morse, Commissioner of Public Works, and by Mr. F. H. Mason, secretary of the chamber of commerce, to both of whom the members of the club are much indebted for the royal way in which they were entertained.

The morning was taken up in a visit to the pumping station, which during the past year has been greatly improved by the overhauling of several of the large pumping engines.

The features of the afternoon's programme were the trip in the fire boat around the harbor, the exhibition of the fire system and the visit to the plant of the Lackawanna Steel Co. The famous breakwater surrounding the harbor was of great interest to all, and also the exhibition by the fire department, but the event of the day was the inspection of the Lackawanna steel plant. The officials of the company were untiring in their efforts to show and explain everything to everybody.

There was a special meeting of the club held on the train on the way to Buffalo. At this meeting the applications for membership from the following were accepted: E. L. Cousins, J. M. R. Fairbairn, C. H. Rogers and Edward Crampton. Two representatives to the advisory board of the Guild of Civic Art were chosen, F. L. Somerville and M. J. Haney, and three members were elected to the city plan committee of the Guild of Civic Art, I. W. King, C. E. Goad and I. Tate.

There were 37 members of the club availed themselves of the opportunity to visit Buffalo.

ON PUBLICITY.

A department of publicity should be a co-ordinate branch of a company's administration. This is heresy now, but it will eventually become orthodox faith.

Publicity is a trade getter, and the largest advertisers recognize that fact and shape their policies accordingly. But the industrial companies are not large advertisers, as advertising goes in these days. The biggest of them spend what the big popular advertisers would think a trifling sum.

But whatever the question may be, the fact is that if you cut down your publicity you reduce your selling power. It may be that you do not wish to sell. — Selling Magazine.

A FIRST CONSIDERATION.

What you say and how you say it are important, but neither is of much consequence unless you address those who are interested in your subject. That is why the choice of mediums should be given first attention.—Selling Magazine.

Machinery Development

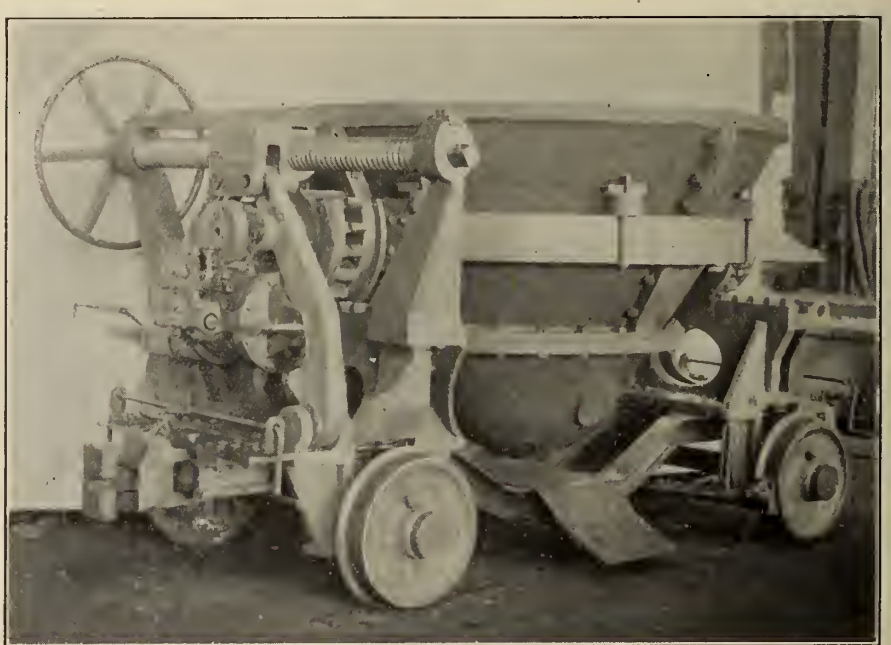
Metal Working **Special Apparatus** **Wood Working**

SMALL "BLISS" POWER PRESS.

TO meet the demand for a small power press to do the work that was formerly done in foot presses, the E. W. Bliss Co., 21 Adams street, Brooklyn, N.Y., has designed and built the small machine which is shown in the accompanying illustration. It is particularly adapted for light work, and is used in the manufacture of burners, light jewelry, and for small hole punching, blanking and forming. While the total weight of this press is only 250 pounds special attention has been given to the design so as to give a strong, compact frame, yet with sufficient die space to accommodate dies of quite some size. The principal dimensions are: Opening in bed, 3-in. diameter; distance back from centre of slide, 3 in.; width of opening in back, 4 in.; distance bed to slide, stroke down and adjustment up, 5 in.; stroke of slide, 1 in.; although the press can be made with 2 in. stroke of slide; diameter and face of balance wheel, 13 in. x 2¼ in.; weight of balance wheel, 50 lbs.; speed of balance wheel, per minute, 150 to 200 revolutions; area of top of bolster plate, 6 in. x 9 in.; height to centre of shaft, 20¼ in.; bench space over all, F. & B. x R. & L., 16 in. x 16 in. The

New Bliss Power Press.

general lines of the presses are similar to the regular Bliss inclinable presses, although some slight changes have been made, due to the small size of the machine. It is fitted with a split sleeve connection having a right and left hand thread, and adjustment is made by simply turning the adjusting screw which is securely locked by means of the two bolts shown. The press is fitted with the Bliss two-piece clutch, which is practically instantaneous in its action, and the wheel, which is a solid web, is bronze bushed.



New Slag Car.

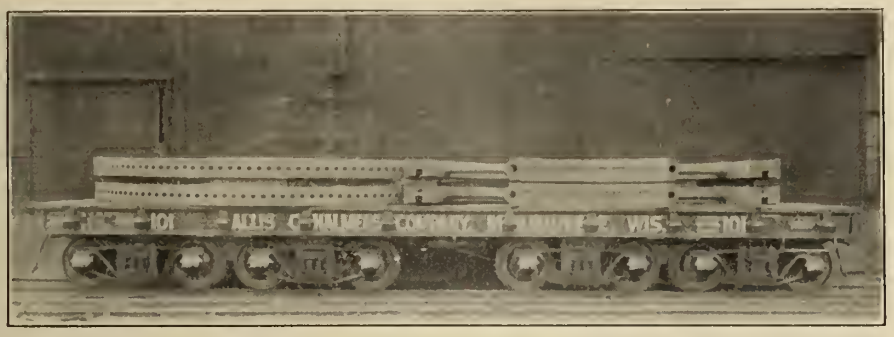
The way these presses are turned out is very interesting. They are made in large quantities in gigs and gauges so that every piece is interchangeable and at the same time is produced at the lowest possible cost, thus enabling the press to be put on the market at a very low figure.

NEW SLAG CAR.

A NEW and interesting type of slag car has recently been designed by the Power & Mining Machinery Co., of Cudahy, Wisconsin. The view shown here is of a ten-ton slag car, of which fifteen were recently built by the above firm for the new Garfield plant of the American Smelting & Refining Co., near Salt Lake City. Some idea as to its size can be gained from the over-all dimensions, which are, 15 ft. long and 6½ ft. high. Each car weighs 27,000 lbs. empty, or 47,000 lbs. when filled with slag. The bowl is made in five sections, the bottom being made in one piece with four quarters forming the top. This allows of any worn or broken part being easily replaced. These sections are securely bolted together and tied to a steel supporting ring by key bolts. The supporting ring is securely riveted to the pinion-toothed trunnions which roll on a racked track. The pinion and the rack are both made open between the teeth to prevent their being clogged by any slag which might be spilled into them. The trunnions are rolled by means of a sleeve which is operated through a lever by a 12-inch compressed air cylinder. This cylinder is designed to operate on 60-lbs. air pressure and to tilt and hold the pot in any desired position. The air valve for this cylinder is a simple four-way cock conveniently operated from the side of the car. All the levers and other operating parts are made of steel to reduce the weight of the machine without sacrificing strength. A hand wheel and screw is also provided so that the bowl can be dumped by hand, should the air supply fail from any cause. When tilted to the extreme position, the side of the bowl makes an angle of 50 deg. with the vertical so as to readily allow the slag skull to slide out. The bowl in dumping is carried to the side of the car by the rolling of the trunnions, so as to dump outside

of the rail. An apron in the middle of the truck prevents any drippings from falling on the track.

The entire body of the car is carried on eight powerful springs placed under the front and read supporting frames and resting on the main bearing boxes. These bearing boxes are fitted with phosphor bronze bearings which are kept lubricated by removable oil waste



Allis-Chalmer's 100-Ton Flat Car.

boxes. The two supporting frames are tied together by two 100-lb. rails securely rivcted to them, and extended to carry the Tower automatic couplers. These are provided with the usual side crank attachment for releasing the coupler. One of each pair of wheels is provided with a bronze bushing so that it can revolve on the axle when going around a curve.

A large factor of safety was used in the design of all the parts of this machine because of the rough usage to which it is put. Special pains were also taken to make it as simple as possible to operate for the men usually employed for such labor.

Slag cars of this design are made in various sizes up to 15 tons in capacity, and with or without the air cylinder.

ALLIS-CHALMERS HUNDRED-TON FLAT CARS.

THE development of power machinery of all kinds, leading, as it has, to the design of prime movers of constantly increasing capacities, has presented some difficult problems of transportation for the larger and heavier pieces of machinery, which have never before demanded solution.

The question of adequate carrying facilities for heavy engine parts has become more and more persistent with the growth of the present tendency toward giant units. The cars used heretofore for the purpose have been especially constructed of heavy material and with a capacity of from sixty to seventy tons. This type of car is, in fact, identical with that employed by the Government for the transportation of heavy ordnance. A new problem in transportation, however, confronted the Allis-Chalmers Company in the case of a huge frame and slide of a monster horizontal rolling mill engine, destined for shipment to the Carnegie Steel Company's plant at Sharon, where it will be installed for heavy service. This single piece which in the rough casting was of approximately 133 tons, will weigh considerably over a hundred tons as a finished part ready for shipment. In seeking a suitable means for overcoming the difficulty of shipping such a piece, it was learned that no single car had ever been built capable of carrying it, and that a special car, designed especially for the purpose, would be the only possible solution. Accordingly orders were placed with the West Milwaukee Car Shops of the C. M. & St. P. Ry., for two sixteen-wheel flat-cars of the required capacity, which are the first of their kind in existence. A few details of construction, showing the unusual sizes of these new cars, are as follows:

Length over end sills, 40 ft. 2 in.
Width over side sills, 8 ft. 9 in.
Height, rail to floor, 4 ft. 4½ in.
Wheel base, 36 ft. 2 in.
Wheels, diameter, 33 in. standard.
Journals, 5½ in. x 10 in.
Weight of car, estimated, between 50 and 60 thousand pounds.
Rated capacity, 200,000 pounds.

The cars are built as low as possible to allow all the clearance space obtainable.

It is decidedly advantageous in building a rolling mill engine, with a capacity like the one in question, to design the frame and slide in a single piece for the purpose of securing the greatest possible rigidity and strength to withstand the racking strains of rolling mill service. This piece in the Sharon engine is the heaviest single casting ever poured at the works of the Allis-Chalmers Company, where some of the heaviest steam-driven units in the world have had their origin. The pattern for this huge casting, measuring 32 feet long, 11 feet wide and 10 feet high, represents the work of ten expert patternmakers for a period of over four months' time; the amount of lumber of various kinds used for the purpose reached the astonishing aggregate of 22,000 feet. The pit dug in the floor of the foundry at the West Allis Works in which this casting was poured, was 40 feet long x 15 feet wide and 11 feet deep. The mold into which the moulten metal was poured took approximately 133 tons of iron, the actual pouring of which consumed from eight to ten minutes. Nine ladles, four with a capacity of 25 tons each, one 13 tons, and four 5 tons each, were used in the operation.

CHAPMAN BALL BEARINGS IN LONDON MACHINE TOOL PLANT.

IN the description of the plant of the London Machine Tool Co., Hamilton, which appeared in the July issue of Canadian Machinery, the fact that the plant throughout is equipped with Chapman double ball bearings was not mentioned. This was an oversight. The London Machine Tool Co. informs Canadian Machinery that these bearings have been very satisfactory in all respects, and that they will be used in further additions which the company are now projecting.

Canadian Pacific Railway Motor Car.

ABOUT CATALOGUES

By mentioning Canadian Machinery to show that you are in the trade, a copy of any of these catalogues will be sent by the firm whose address is given.

Reflections of a Rambler. A very neat little booklet gotten up by the Warner & Swasey Co., Cleveland, O., to advertise their prism binoculars and prism terrestrial telescopes. The use of a binocular or telescope is pointed out in an attractive and original manner in "Reflections of a Rambler," by E. E. Peake.

Screws, Bolts, Nuts. The regular catalogue of the Brantford Screw Co., Limited, Brantford, Ont., containing illustrations and miscellaneous information of their regular product. The catalogue is exceptionally well arranged and is certainly a credit to the company. Size, 5 x 7 1-2 inches.

The Last West. A very handsome bulletin gotten out by Board of Trade, Edmonton, illustrating and describing Edmonton and the agricultural, industrial and commercial opportunities in and around the city. The bulletin is printed in two colors, brown and black, which gives a handsome tone to the illustrations.

McVicker Automatic Gas Engine. A catalogue of the gas and gasoline engines to be made in Canada by the Canadian McVicker Engine Co., Galt, Ont. The engines are well illustrated and described, and because there are some features in the engine not incorporated in the ordinary gas or gasoline engine, the catalogue should prove of more than ordinary interest.

King Edward Induction Motors. Bulletin No. 26, of the Consolidated Electric Co., Yonge street, Toronto, illustrating and describing the King Edward polyphase induction motors, and the King Edward multi-polar dynamos and motors.

Do You Tumble? A very handsome little booklet issued by the Globe Machine & Stamping Co., Cleveland, O., containing descriptions, illustrations and price lists of tilting tumbling boards. It will be noticed that horizontal tumblers and also some patented tumblers are quoted in this booklet, which have not before appeared in the literature of the company.

The Silent Partner. The June and July issues of the Silent Partner, a monthly periodical published by the Globe Machine & Stamping Co., issued for the purpose of "taking our patrons and prospective buyers into our confidence." The publication is certainly unique and very interesting.

Westinghouse Railway Motor. May Circular No. 1129, illustrating and describing the Westinghouse No. 119 O.C. railway motor. The motors are described and illustrated in detail and the operation of several motors are illustrated on an ampere base as regards efficiency, speed, electrical horsepower, brake horsepower, torque at foot radius, and safe time for load in service 20 degrees C rise from 75 degrees C.

Gisholt Warren Works. The Gisholt Machine Co., Madison, Wis., have purchased the plant and patents of the American Turret Lathe Mfg. Co., of Warren, Pa., and are sending out a leaflet showing some exterior and interior views of the plant.

Hot Blast Heating Aparatus. An exceptionally neat booklet, describing and pointing out the advantages of the system of hot blast heating apparatus, being sent out by Sheldons, Limited, Galt. The booklet is well illustrated.

Brakes for Motors. Circular No. 1134 of the Westinghouse Electric & Manufacturing Co., Pittsburg, Pa., illustrating and describing electrical and mechanical brakes for type K. motors of the Westinghouse Co.

Making Stereotype Plates. Catalogue of machine tools and supplies for making curved stereotyped plates for Harris presses, sent out by F. Wesel Mfg. Co., 70-80 Cranberry street, New York. The catalogue is well illustrated.

Core Type Transformers. Bulletin No. 65 of the Crocker-Wheeler Co., Ampere, N.J., illustrating and describing the core type transformers for high tension transmission. The detail construction of the transformer is described and the bulletin is well illustrated. The Packard Electric Co., Limited, St. Catharines, Ont., are Canadian agents for the Crocker-Wheeler Co., and this bulletin may be obtained through them.

I. H. S. Engines. Large catalogue of gas and gasoline engines of the International Harvester Co. of America, Chicago. Portable and stationary engines are described and illustrated. Size, 8 x 10 inches.

Murray Corliss Engines. Catalogue No. 56 of the Murray Iron Works, Burlington, Iowa, describing their standard Corliss engines, high pressure steam boilers and complete power plants. The catalogue is very complete and is exceptionally well illustrated. Size, 9 x 12 inches.

Notes on High-Speed Steel. An interesting pamphlet, of vest-pocket size, presenting the arguments of J. J. Beardshaw & Son, Sheffield, for their "Conqueror" brand of high-speed steel. The Canadian representative of this firm is Alexander Gibb, Montreal.

Westinghouse Protective Apparatus. May, 1906, Circular 1132 of Westinghouse Electric & Mfg. Co., Pittsburg, Pa., describing and illustrating their protective apparatus, including lightning arresters, choke coils, static interrupters, etc. The circular is well illustrated.

Wood Split Pulley. Small descriptive catalogue and price list of "Standard" wood split pulleys, the sole makers of which are the Dodge Mfg. Co., of Toronto, Limited. Besides which the catalogue illustrates and describes special pulleys, including cone pulleys, taper pulleys, iron centre wood rim pulley, patent split friction clutch and sleeve, solid friction clutch mechanism and genuine oak tanned leather belting.

Power and Economy Producers is the title of a 36-page booklet issued by the Williams Gauge Co., of Pittsburg, Pa., giving detailed descriptions of the various steam specialties manufactured by them, including safety feed water regulators, auxiliary feed water regulators, high-pressure steam traps, rotating regrinding gauge cocks, steam pump governors, safety water columns, chain lever water gauge, etc. The book is well illustrated with cuts of a number of large plants where the firm's gauges have been successfully adopted. A copy may be obtained by addressing the Canadian branch, Temple Building, Montreal.

Et Locomotive Brake Equipment. An interesting instruction pamphlet published by the Canadian Westinghouse Co., of Hamilton; contains fifty-nine pages of educative reading matter on the workings of the Et air brake equipment, with many drawings and cuts to illustrate the instructions.

Practical Questions and Answers

In view of interest that is being taken in the producer-gas plant question at the present time, the following questions and answers taken from the 1906 "Question Box" of the Ohio Gas Light Association, will be of decided interest :

Cost of Producer Gas Plants.

Ques.—What is the cost of producer gas plants, suction and pressure types, using bituminous and anthracite coals ? What portion of this cost goes to generators, scrubbers, washers, holders, etc.?

Ans.—The selling price of producer gas plants for engine purposes will be found to average about as follows : Pressure anthracite coal gas producer plant, erected complete, not including freight and traveling, $25 per horse power. The same arranged for bituminous coal, $27 per horse power — these prices being for sizes in the neighborhood of 300 horse-power. Costs are distributed about as follows :

Twenty-five per cent. for producer proper.

Fifteen per cent. for scrubbers and purifiers.

Thirty per cent. for the gas holder and the balance for piping and general fittings.

In the bituminous coal plant the only increase in price will be found in the scrubber and purifier apparatus, which in this case will be 20 per cent. instead of 15 per cent. Roughly speaking, the suction producer plants, both bituminous and anthracite, would cost about one-half the above; the reduction in cost being, firstly, that the producers operating under suction have almost twice the capacity of those operating under pressure, and, secondly, the gas holder is entirely eliminated.

While these figures are fairly close, each installation should be considered separately, as local conditions and the fuel to be employed will have considerable bearing upon the price of the outfit.

The price per horse-power of suction gas producers of from 25 to 250 horse-power of one maker may be represented by the equation :

$$\text{Price per horse power} = \$11 + \frac{400}{\text{H.P.}}$$

Assume a producer in good condition, operated by an experienced producer fireman, furnishing gas for a twelve-hour run to a gas engine running on a reasonable steady load, what should be the average, highest and lowest heat values of the gas during the whole run of twelve hours ? Express the heat value of the gas in lower B.T.U.'s (assumes water of combustion not condensed) per cubic foot, measured at 62 degrees F. and thirty inches mercury.

If a gas producer is designed so that the ratio of air and steam can be controlled automatically for variable loads, the gas should not be higher than 140 B.T.U. nor lower than 125 B.T.U. at any time.

The average highest and lowest heat values on a regular producer plant of correct design would be 155 and 125 B.T.U. respectively. This variation in B.T.U., however, is almost entirely due to the varying percentage of hydrogen in the gas occasioned by the difference in load on the plant. For very steady loads the gas would hold between 120 and 130 B.T.U.

Skill Required by Fireman.

Ques.—How would the skill required by a first-class producer fireman compare with that of a good boiler fireman ?

Ans.—It does not require any special knowledge to run a gas producer. Suction producers are generally run under set conditions, all excess gas going into a holder, while the fireman merely carries out instructions. In any case, producers require very little attention as compared to boilers, and what they do require is not of a high order.

The skill and intelligence required for a producer fireman is the same as that required for a boiler fireman; the difference being, however, that whereas the boiler fireman can be picked up in the market, the producer fireman has usually to be educated up to his work, as this class of labor is very scarce and the good men are practically all employed.

Our experience has been that many first-class boiler firemen fail as producer firemen. Aside from the mere labor of handling a certain amount of fuel there is little similarity in the work; the combustion is conducted on entirely different principles and more intelligence is required to make a good producer fireman.

Depends upon the kind of producer used. With certain producers an ordinary laborer can, with little instruction, operate the producer as well as the most experienced fireman. With the Smith automatic suction producer the only labor that is required is to charge it in the morning and have the grates cleaned and blown and it is ready for a twelve to sixteen-hour run. Then the fireman may work at anything else after the engine is started till time for shutting down.

Equal—power for power. But for equal skill the wages of the gas producer fireman would be greater because of the limited supply.

Influence of Compression.

Ques.—Does the compression influence the horse-power of a gas engine ? If so, how and why ?

Ans.—A weak mixture of poor gas with the air necessary for combustion may be made combustible by high and rapid compression. In the engine cylinder the fuel gas is diluted by the nitrogen in the incoming air, and also by the burned products left in the clearance space. This mixture must be highly compressed to bring the particles of the combustible gas and oxygen close together and thus insure a certain ignition and quick combustion. If a quick combustion does not take place, the hot gases, at their highest temperature, are exposed to a larger surface on the cylinder walls, which causes a relatively great loss of heat. Besides, a higher rate of compression forces a greater weight of gas into the clearance volume, and the ratio of the cooling surface of the cylinder walls per unit of weight of gas is smaller at the highest temperature of explosion.

At the same time the rapidity of combustion increases the amount of heat per unit volume, and this heat is more rapidly converted into work done on the piston. The maximum pressure reached in the explosion stroke allows a greater range of expansion of the products of combustion after the heat is generated and increases the range of temperature in the cycle, which directly increases the thermal efficiency. However, as the compression is increased, the work the fly wheel is called upon to do in carrying the engine through the cycle is increased and a medium must be found by experiment at which the highest efficiency is obtained.

The pressure, after explosion in a cylinder, is about four times the initial compression (both these pressures being above atmosphere), so it is easily seen that an increased compression greatly increases the M.E.P. of the stroke and consequently the horse-power.

Objections to excessive compression are excessive heating of cylinder walls, causing pre-ignition and increased leakage past piston rings and valves.

The Need of a Practical Education*

BY THOMAS D. WEST

THE American Foundrymen's Association was organized for the purpose of encouraging research in the art of founding, for disseminating the knowledge of its principles, and aiding in the improvement of daily practice in all its branches. While it is said that this is a practical age, that designation is far less warranted than might be wished. In the pernicious activities of so-called reformers and in the vague conceptions and theories widely entertained a possibility of danger that should be cause for serious consideration. There is so much of the impractical and incompetent in modern life that these are responsible for more strife and ill success than all other evils combined. Not one person in fifty is as thoroughly practical and competent as he should or could be, and the foundry business gives ample proof of the shortcomings of those who are presumed to be skilled artisans. The deficiencies in modern industrial life are to be attributed to the fact that our schools do not give the rising generation the practical training they should have.

The allurements of a life of ease and refinement to which the Caucasian race is so partial find expression in the pursuit of a professional or classical education and the ignoring of manual pursuits because they may involve hard work and dirt. If this evil is not corrected the day will come when all classes of our people will suffer keenly for the errors of impractical parents and instructors.

There are two factors which must be taken into account more fully in our educational system as well as in our home training if better conditions are to be realized in the future, and these factors are: a practical education and manual skill. When on every hand there are to be found young and old unable to earn a living for lack of the above mentioned factors in their education, when there is a great demand for manual skill, which, as a rule, requires as much time and effort to be attained as the schooling now in vogue, if not more, why should not manual skill be respected and encouraged more than it is?

Practical Training Advocated.

The education of our youth should be confined to that which can be directly utilized. The time wasted in ornamental studies that can never be made use of ranges from one to four, and often more, of the most precious years of life, and passes many on to an age when they cannot take up studies or an apprenticeship which in a few years might enable them to make a good living. All children should have a common school education, but when they have attained this the parents or guardians should discover, if possible, the capabilities of their children and then decide for what vocation they shall be trained. Even special study that does not bear directly on the vocation to be followed should be put aside. What is a necessity should be studied with zeal and a regard for the saving of all time possible. What sense is there in spending valuable time studying subjects which, because they cannot be utilized, will soon be forgotten?

Few of our educators are in a position to comprehend the necessity of the practical as compared with the book work of the professional or classical student. Every energy has been directed to perfecting the latter, and now this should be done for the former. Good literature on the practical aspects of life and the attainment of skill can be made to serve as text-books as much as studies on political economy, history and English literature. Once it is recognized that there is as much need of the practical as the professional, and text-books will be forthcoming that will improve the views of the masses in a way now impossible. It is not to be expected that a change of this kind can be made in a few years, as the machinery of education is naturally devised at the present time for carrying out the contemporary tendencies. Even our universities and colleges are at the present time driven to combat the evils of excess in sports, which, unfortunately, are strongly backed up by the public support given to athletic games. The excesses in this line are now so opposed to the aims of these institutions that at a recent gathering in New York City, of professors and instructors, measures were taken to prevent the loss of time now resulting from these games, to the great detriment of classroom and laboratory work.

Specialization Demanded

The revolution in industry through the specialization of the past 10 or 20 years is a move toward the attainment of the practical in science that has not received the recognition it deserves. It really means that no one should expect to master more than one vocation. At one time an individual could undertake to be master molder, machinist and blacksmith, but this is not possible now. All who are highly skilled in the art of founding know that he who wishes to be in the lead, or the master of the sand heap and cupola, either as a worker or manager of men, can spend every minute of a ten-hour day in the shop and his evenings in study and research during a long life, and still have much to learn.

To be practical people we must, in connection with the other reforms mentioned, specialize our studies and labor so as to be masters of one vocation, not "jacks of all trades and masters of none." The smatterer or "would be" is an affliction that causes many of our industrial enterprises great losses and perplexities. To the lower working classes it means high cost of living and often much misery, which is entirely uncalled for and should not exist.

The starting of the reform needed would lie chiefly with our leading associations. Let them appoint committees consisting of men broadly experienced in the actual work of all lines of endeavor they represent, to select the subjects to be followed after passing through the grammar school grades, as well as to designate what the demands are for the employment of skilled workers in their respective lines. These associations should include, among others, architects, blacksmiths, the business professions, carpenters, chemists, civil engineers, draughtsmen, doctors, editors, electricians, farmers, masons, mechanical engineers, metallurgists, mining engineers, ministers, molders, patternmakers, painters, plumbers, and down the list to supply men, stationery engineers and wheelwrights.

A founders' committee would not, I think, recommend the wasting of time by those wishing to learn the art of molding upon studies that could rarely, if ever, be utilized. In fact, the preparatory study could be narrowed to a common school education, with drawing, chemistry and some metallurgy. The latter three could be taken after leaving the regular school as special studies in day or night schools under some instructor or technical institution knowing just how much of these studies the molder, foundry foreman or manager should pursue. This committee, aside from recommending what special studies were necessary, could also set forth the title of such books as should be read at leisure, in addition to those used as text books.

The Foundrymen's Association Doing its Part.

This address may be considered as an appeal for a reform in education and home training to an association that with a few others stands foremost in

* Abstract of President's address before the American Foundrymen's Association, at their eleventh annual meeting, Cleveland, Ohio.

doing what can be rightly commended as advancing civilization. What greater liberality of spirit can be shown by a body like the American Foundrymen's Association than for its members to give gratuitously to the world their trade secrets and experiences, which cost them great labor and often great expense, and which but a few years ago, comparatively speaking, all would have held in their strong boxes.

We have Socialism and other isms asking for public support, but few have given this and other kindred associations credit for putting aside selfishness, for gratuitously distributing information, and creating among rivals in trade a co-operation beneficial to the masses as well as themselves.

There are over 5,000 proprietors of foundries, and as many more superintendents and foremen, besides allied interests, such as chemists, patternmakers and supply men, that should take great interest in our association's work. There are many who naturally do take a great interest, and those who do not would doubtless do so were they to attend one of the meetings or to take the time to investigate the good work that has been accomplished by our members helping each other to advance knowledge and skill in the art of founding.

While much good has been accomplished by our association, there is still greater work before us; but to do this properly we should have a much larger membership. It is to be hoped that this Cleveland convention will result in giving an impetus in this direction. In justice to ourselves we cannot recede; we must enlarge and press forward. Can we say more in soliciting outside craftsmen to join us? Education is our association's motto, and by making it as practical as possible we can do a great good in helping to make this world grow better. This association and kindred societies will certainly have to labor for more practical methods of instruction if, as a people, we expect to develop the needed skill in our artisans or to obtain the greatest comfort and happiness for the masses.

RAILWAY EXTENSION WORK.

Arrangements are being completed by the Grand Trunk Pacific Railway for the transportation of 289 cars, engines and steam shovels from Montreal to Portage la Prairie, the point at which the construction of the new transcontinental line commenced. These cars and locomotives form Grand Trunk Pacific rolling stock, and their movement to the west means the inauguration of advanced construction work.

At the Noon Hour

ELECTROPHOBIA.

THEN the passen said they wid have to build 'lectrical works and have a watter-will to drive the dominoes. Wat the dominoes be for I carn tull 'e, onless 'tis for the workmen to play wi' day times when thur idden no light wanted. Then all you'd have to do wid be to press a button, an' there you'd be.

Wull, then up gets ole 'Lias Grant. "Shan't 'ave nort to do wi't. Thayse yer noo-fangled things be a-temptin' o' Providence. The Lord send'th us the darkness, therefore 'tis meant for our gude, and us got no right to try to counteract the work of Providence. If such things was carried out there wid be a judgment on the parish some time or nuther; same's 'twas at Little Critchcombe, where the passen insisted on doin' away wi' the old high pews wat 'ad been in the church ever since 'twas a church an' puttin' in a passel of cheers; an' the very nex' wik nearly ev'ry pig in parish 'ad swine-faver. Therefore, he shid voat agin it. Our fathers graupid their way about in the dark, he said, an' so did our gran'fa's; an' wat was gude nuff fir they was gude nuff fir we."

There was a gude many wat was 'Lias's way o' thinkin', and they gid the ole chap a gude clap for spaikin' up so wull; to the squire an' all.

Than ole Sammy Bussacott got up, an' said what he objected to was the buttons. 'E adn' got a word to say 'gin the 'lectric light nor any other kind o' light; but they buttons was wat 'e objected to. Buttons was a nuisance, Sammy reckoned. They was orwiz comin' off. 'E'd jiss ad wan come off, now, since 'eed bin in the meetin', on'y droo pickin' up his pipe off the floor. And now 'eed on'y got one left to go home wi', and if aught shid happen to thiky, a purty fine hole he'd be in. That was yer buttons, and he widden have nort to do wi'm. If the 'lectric light cude be worked wi' a bit o' string instaid o' buttons he 'adden got a word to say agin it. But if so be it must be buttons, then he widden have it at no price."

"Wull, Tom, and wat was the end o't?" says Billy Snell.

"Au! the buttons do'd it," said Tom. "Arter that noan o'm hardly widden voat for 't, an' so it falled droo. In fac' yu mid say it valled droo the button-hole."

—Western Weekly News.

If one employer doesn't see your merit another will.

A MODERN CHRICTON.

To the Chairman of the Council—Sir, I notice you require
A working electrician (list of duties as per ad.)
And in making application for this post which I desire,
Would enumerate in passing, the advantages I've had.

I have passed examinations in approving installations,
In jointing up concentric, and in balancing my books.
I am quick at understanding any startling innovations,
And have been, by many persons, complimented on my looks.

I am used to cleaning arc lamps, and to making house connections,
I am good at correspondence and at laying sundry mains,
Gas and water, and electric. I can carry out directions,
And have many testimonials for my way of testing drains.

I can keep all books of record needed by your undertaking,
And require no unskilled labor to assist me in my work.
I can fix, and read the meters, and can help you in the making
Up of quarterly accounts, and you will never find me shirk.

I'm delighted at the prospect of pedestrian excursions
Switching on and off your street lights, and shall never seek a tip.
And if your quaint revivals should require complete immersion.
I would voluuteer my services to superintend the dip.

I have not the least objection to assisting with the sweeping
Of the streets that you are lighting, or to helping pave the same;
Or to waiting at your banquets. Both in waking and in sleeping
I shall use my best endeavors to enhance your council's fame.

I may add I wear a collar, and could occupy my leisure
Playing bridge, or entertaining in your lofty social sphere.
So, trusting to be favored, and awaiting your good pleasure,
I remain, yours most sincerely,
John Alfonso Vere de Vere.

—The Electrical Times.

TRAINED MEN.

This is the day of the trained man. In competition with him, the untrained man, or the poorly trained man, cannot maintain himself. Do not be afraid of too much theory. Never was good practice which was not preceded by and based upon good theory. Let your theoretical training be broad and deep. It is your only sure foundation for the best work.—Henry S. Pritchett, president of the Massachusetts Institute of Technology.

THE McVICKER GAS ENGINE.

THE CANADIAN McVICKER ENGINE CO., LIMITED, are starting a large gas and gasoline engine works in Galt, Ont., and they will be associated with the Alma Manufacturing Co., Alma, Mich. The Canadian company will build the McVicker engine, which is being built in the United States by the Alma Manufacturing Co. This engine has some very distinct features of its own, and a description and illustration of it will be of interest.

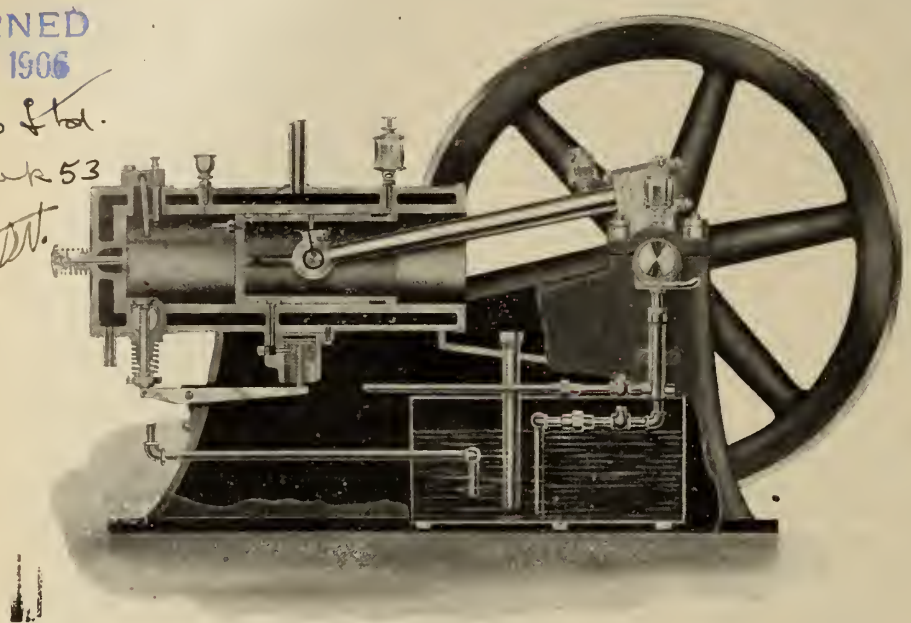
Cut Book 53
Page 1



The McVicker Engine.

The engine is a four-cycle one, but is built without gears, cams, eccentries or trigger work of any kind. The arrangement of the valves may be seen from the accompanying sectional view of the engine. The inlet valve is of the simple poppet type placed in the back of the combustion chamber, which is situated directly behind the piston, the full force of the explosion thus being obtained on the piston. The exhaust valve also is of the poppet type operated by the exhaust itself through a by-pass as seen in the sectional view. The advantages of this, besides its simplicity, are that no power is taken from the crank shaft for the operation of the valve and an unignited charge is preserved instead of being expelled through the exhaust port, as in engines with mechanically operated valves.

The method of governing is of the "hit and miss" style, and the company guarantee that the engine will govern on variable loads within a fraction of one per cent.

In the McVicker carbureter the gasoline is atomized by mixing it mechanically with air. The atomizer requires no adjustment for varying loads, and thus the needle valves need not be moved after once set.

The base of the engine is a heavy casting reinforced at crank bearing. The cylinder is provided with an extra large water jacket, and is fitted in planed ways to secure good alignment. The crank and connecting rod are drop forgings, and the bearings are made of special composition brass. The piston rings are four in number, and are turned concentric. The igniter is a positive "make and break" type, and is located on the top of the cylinder. The points can be readily examined by simply removing two screws. All the parts are made from jigs, and thus are interchangeable.

Up to the present these engines have not been sold in Canada, but the Canadian company intend to build the engines in sizes from 2 to 100 h.p.; but at present, however, only the smaller sizes from 2 to 30 h.p. will be made.

THOR PNEUMATIC SAW.

THE Independent Pneumatic Tool Co., of Chicago, has recently placed on the market a novel and interesting machine, as per accompanying illustration. This machine is operated by compressed air, and is designated as the "Thor Pneumatic Saw." This machine is especially designed for use in railroad car shops and by shipbuilders, car builders and contractors, for cutting and trimming roofs, doors, sides, floors, etc. It weighs only 20 pounds and has a speed of 8,000 r.p.m. The length of same is 14 in.; width, 4½ in.; height, 9 in.

This machine is easily handled and operated by one man, and no experience is necessary for the use of same. It will cut one inch thick lumber at the rate of sixty feet per minute. A governor automatically controls the speed of the machine, and is adjustable in case different speeds are desired.

The machine is made from suitable and highest grade of material, and nothing in its construction is liable to destruction, or any parts to wear out. All bearings are covered and revolve on the very best grade of steel balls. The great velocity of this machine necessitates highest class of workmanship, and the utmost care in balancing the working parts, and for this reason the machine is free from vibration. It is a great time and labor saver, and can be used on the finest class of cabinet work without soiling the product by oil or grease, as no lubrication is necessary, except a few drops of light oil occasionally inserted through the ends of the shafts.

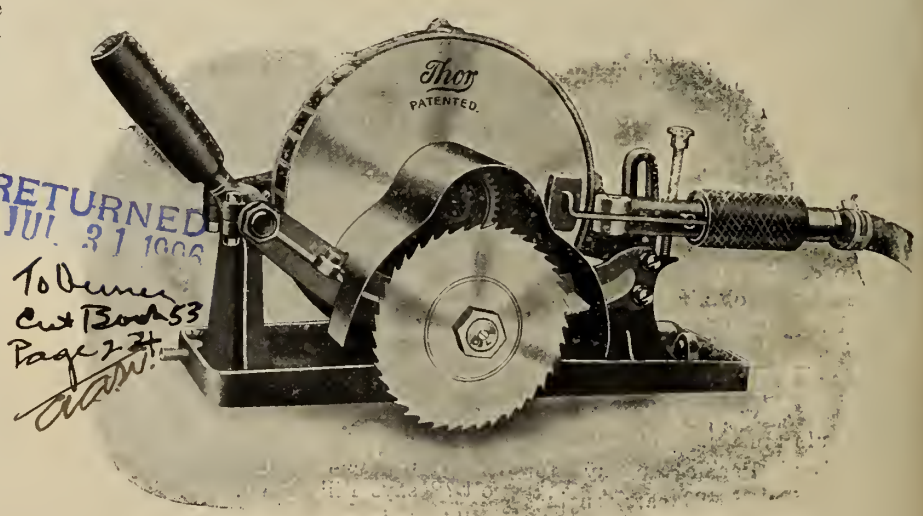
Page 2 3



The "Thor" Pneumatic Saw.

Exhaustive tests have been made of this machine in some of the largest railroad and car shops, and the results obtained have been eminently satisfactory.

Companies Incorporated

Turret Crown, Limited, Toronto ; capital, $125,000 ; purpose, to build and operate steam vessels. Directors are : A. W. Mackenzie, D. B. Hanna, L. W. Mitchell, all of Toronto.

The Pure Ice Co., Limited, Montreal ; capital, $95,000 ; purpose, to manufacture and cut ice. Directors are : B. Sawyer, N. C. Smillie. E. P. Sawyer, H. Timmis, all of Montreal.

Ames-Holden, Limited, Montreal ; capital, $2,500,000 ; purpose, to manufacture leather and rubber footwear. Directors are : Jas. Redmond, H. B. Ames, A. R. Holden, all of Montreal.

Herron-Leblanc, Limited, Montreal ; capital, $90,000 ; purpose, to manufacture and deal in grocers' and druggists' supplies. Directors are : J. LeBlanc, R. S. Herron, W. H. Johnson, all of Montreal.

West Ontario Oil Co., Limited, Petrolea, Ont. ; capital, $100,000 ; purpose, to carry on the business of oil operators and producers. Directors are : D. Eastman, J. W. Craise and A. McIntyre.

Boswell & Brother, Limited, Quebec ; capital, $500,000 ; purpose, to carry on the business of brewers, maltsters, etc. Directors are : V. Boswell, J. W. Boswell, A. W. Boswell, C. E. A. Boswell, all of Quebec.

The Leach Piano Co., Limited, Montreal ; capital, $145,000 ; purpose, to manufacture and repair pianos and other musical instruments. Directors are : W. H. Leach, A. L. Dupont, L. O. Boucher, all of Montreal.

Superior Oil Co., Limited, Sault St. Marie, Ont. ; capital, $500,000 ; purpose, to manufacture and deal in oils, greases, soaps and similar products. Directors are : E. L. Stewart, Andrew Elliott and D. I. Millar, all of Sault St. Marie.

Berard & Major, Montreal, have been incorporated with $200.000 capital by Dominion charter proposing to make vehicles of all kinds. The incorporators are A. Berard, E. Major. J. Berard, G. Major and J. M. Mercier. all of Montreal.

The Schofield, Holden Machine Co., Limited, Toronto ; capital, $40,000 ; purpose, to carry on the business of engineers, machinists and shipbuilders. Directors are : Richard Schofield. A. P. Holden and M. H. Anderson, all of Toronto.

The Ottawa Wine Vault Co., Limited, Ottawa ; capital, $250,000 ; purpose, to manufacture and deal in wines and other liquors and cigars, etc. Directors are : G. Lebel, A. Charbonneau, T. J. Brule, J. L. Matte and P. Prudhomme, all of Montreal.

Grand Trunk Pacific Terminal Elevator Co., Limited, Montreal ; capital $5,000,000 ; purpose, to carry on elevator and warehouse business. Directors are : C. M. Hays, Wm. Wainwright, A. P. Stewart, W. H. Biggar, all of Montreal, and N. Bawlf, Winnipeg.

La Compagnie Chiminique Uinot, Limited, Montreal ; capital, $20,000 ; purpose, to manufacture and deal in pharmaceutical and chemical products. Directors are : A. Chevalier, A. Chapdelaine, L. J. Berard, A. La Malice, F. Poupart, all of Montreal.

The Manufacturers' Natural Gas Co., Limited, Hamilton ; capital, $200,000 ; purpose, to bore for natural gas and to manufacture artificial gas for all purposes. Directors are : John Milne, Wm. Southam, W. G. Walton and G. I. Staunton, all of Hamilton.

The Composite Brick Co. of Parry Sound, Limited, Parry Sound, Ont. ; capital, $20,000 ; purpose, to manufacture and deal in artificial stone and all kinds of compressed or paving brick, etc. Directors are : C. A. Phillips, G. G. Gladman, A. Logan, all of Parry Sound.

The Improved Shuttle Co. of Canada, Limited, Montreal ; capital, $30,000 ; purpose, to manufacture and deal in shuttles, looms and mill supplies of all kinds. Directors are : H. D. Metcalf, C. P. Metcalf, C. N. Blakely, W. S. Hutchison and F. C. Saunders, all of Montreal.

The Supreme Heating Co. have been formed at Owen Sound with $200,000 capitalization by S. J. Parker, A. J. Ross, W. R. Hampden, W. Taylor and A. G. MacKay, all of Owen Sound. The company proposes to manufacture stoves, ranges, furnaces and other heating goods.

Gallagher Iron Mining Co. have been incorporated under Ontario charter, with a capital stock of $500,000, to carry on a general mining and reduction business. The provisional directors are F. P. Sullivan, J. J. Gallagher and F. H. Hughes, with head office at Sault Ste. Marie.

The Clark Automatic Nut Lock Co., Montreal, capitalized at $500,000, has secured a Dominion charter and propose to manufacture bolts, nuts and other metal goods. J. D. Good. E. James. W. J. Henderson. J. Rockwell, and E. Lanquedoc, all of Montreal, are the incorporators.

The Stevens-Hepner Co., has been organized with headquarters at Port Elgin. The company will manufacture brushes, woodenware, etc. The capital stock amounts to $150.000, the directors being H. H. Stevens and Jno. Hepner, of Port Elgin, and C. M. Bowman, of Southampton.

The Portland Cast Stone Co. have been incorporated under Ontario charter, with a capital stock of $40.000, to manufacture and deal in cement, limestone, plaster, etc. The provisional directors are W. F. Colwill, J. T. Colwill and W. W. P. Colwill, with head office at Guelph.

North Ontario Reduction & Refining Co. have been incorporated under Ontario charter, with a capital stock of $500.000, for the purpose of carrying on a general mining and reduction business. The provisional directors are J. A. Young, jr., H. R. Ritchey, J. J. Wright, D. G. Bremner and J. S. Tomlinson, with head office at Toronto.

Para Construction Co., Limited, Toronto ; capital, $2,000,000 ; purpose, to carry on a general construction business including the building of tramways, docks, piers, reservoirs, embankments, etc. Directors are : J. S. Lovell, Wm. Bain, Robt. Gowans, E. W. McNeill and W. F. Ralf, all of Toronto.

The Canadian McVicker Engine Co., Limited, Galt, Ont. ; capital, $100,000 ; purpose, to acquire the patent rights covering the McVicker automatic gas and gasoline engines, and to manufacture the same. Directors are : J. R. Golden, C. L. Weisner, T. J. Lannen and H. H. Tillinghaste, all of Galt.

The Canada Dredge Manufacturing & Purchasing Co., Limited, Newcastle, N.B. ; capital, $500,000 ; purpose, to manufacture and deal in dredges and dredging machinery. Directors are : W. H. Russell, Newcastle ; H. D. Aiton, Redbank ; G. J. Sproul, W. L. T. Weldon and R. A. Murdock, all of Chatham, N.B.

The Script Weight Recorder Manufacturing Co., Limited, Joliette, Que. ; capital, $49,000 ; purpose, to manufacture a record-making apparatus for weighing scales under the patent rights of L. V. Lahelle, and to carry on business of manufacturers, founders and machinists. Directors are : S. P. Champoux, J. M. Tellier, L. V. Lahelle, L. P. Deslongechamps, all of Joliette.

Railway Supplies, Limited, have been incorporated under Ontario charter, with a share capital of $250.000, for the purpose of manufacturing rails, rail joints, etc., and all articles into the manufacture of which metals enter. The provisional directors are J. S. Lovell, Wm. Bain, Robt. Gowans, E. W. McNeill and W. F. Ralph, all of Toronto, and the head office to be at Toronto.

Oil Well Supply Co., Ltd., have been incorporated under Ontario charter, with share capital of $100.000, for the purpose of carrying on the business of a general machine shop and the manufacture of drill tools, etc., now carried on by the Oil Well Supply Co. The provisional directors are James Joyce, J. A. MacKenzie and E. A. Westland, all of Petrolea, with the chief place of business at Petrolea.

The Canadian Rail Joint Co. have been incorporated under Ontario charter with a share capital of $250.000, for the purpose of manufacturing rails, rail joints, etc., and all articles into the manufacture of which metals enter. The provisional directors are J. S. Lovell, Wm. Bain, Robt. Gowans, E. W. McNeill, W. F. Ralph and S. G. Crowell, all of Toronto, with chief place of business at Toronto.

The Renfrew Brick & Tile Mfg. Co. have been incorporated under Ontario charter, with a share capital of $20,000, for the purpose of taking over the business of Thos. Henderson, of Renfrew, and of manufacturing and dealing in brick, tile, artificial stone, etc. The provisional directors are Thos. Henderson, J. E. Barnet, Allan Francis, P. S. Stewart and Robt. Leitch, all of Renfrew, with head office at Renfrew.

Welland Concrete Co., Limited, have been incorporated under Ontario charter, with a share capital of $200,000, for the purpose of manufacturing and dealing in brick, cement blocks, gravel, stone, builders' supplies, etc. The provisional directors are George Arnold and J. P. Eastman, of the Township of Pelham, County of Welland; B. J. McCormick amd S. P. Townsend, of Windsor, and C. F. Berry, of Detroit, Mich., with head office at the Town of Welland.

The Canadian Newcombe Motor Co. have been incorporated under Dominion charter, with a share capital of $600,000, for the purpose of carrying on the business of manufacturing and dealing in power generators and motors, and to construct vehicles, agricultural implements, etc. The provisional directors are W. F. Borland, Westmount, Que.; Duncan McDonald, W. J. White, F. L. Wanklyn, and P. F. Richardson, all of Montreal, with head office at Montreal, Que.

INDUSTRIAL PROGRESS

MACHINERY AND MANUFACTURING NEWS would be pleased to receive from any authoritative source industrial news of any sort, the formation or incorporation of companies, establishment or enlargement of mills, factories or foundries, railway or mining news, etc. All such correspondence will be treated as confidential when desired.

Arden, Man., residents will build a $10,000 hotel.

Vegreville, Alta., will build a hospital to cost $6,000.

The Y.M.C.A., Edmonton, will build a $60,000 building.

J. Malcolm is to erect a $16,000 hotel at Claresholm, Sask.

A new school will be built in Toronto East, to cost $47,000.

Peterborough will have an isolation hospital to cost $10,000.

Sova & Barbour have opened a plumbing shop at Winnipeg.

A foundry to do general work is to be opened up in Saskatoon, Sask.

A large addition is being made to the New Ontario hotel at Fort William.

Osler, Hammond & Nanton will erect a $200,000 office building in Winnipeg.

P. J. Manion is preparing plans to erect a $250,000 hotel at Fort William.

Seaforth has voted the W. H. Willis Shoe Co. $10,000 to establish a shoe factory.

Japanese metal buyers are looking to Canada for future supplies of nickel and carbide.

The Hamilton Bridge Works are to build an addition to their works 400 x 420 feet.

Additions costing $145,000 will be made to the Miserecordia Hospital at Winnipeg.

John Pentland is promoting a company to manufacture cement blocks at Brantford.

St. Mary's (Ont.) capitalists are contemplating starting a rubber works in that town.

The Dominion Packing Co., of Charlottetown, P.E.I., asks tenders for its entire plant.

The new hotel to be built by the Castle Hotel Co., at Edmonton, will cost $70,000.

The Peterborough & Chemong Auto Car Co. have been formed, with a capital of $5,000.

The German Cardboard & Photo Mount Co. are to establish a factory at Peterboro.

A New York firm is contemplating establishing a pulp mill at Charlton, in New Ontario.

The German Cardboard & Photo Mount Co. will build a factory at Peterborough.

W. Bentham, Montreal, is to build a large apartment house to be called the "Cavendish."

The Eastman Cutlery Co. are negotiating with London with a view to establish there.

The Canadian Folding Box Co., Brantford, are looking for a site for enlarging their plant.

The Vulcan Boiler Works have commenced the manufacture of boilers at New Westminster.

The Cockshutt Plow Co., Brantford, intend to build an addition to their three storey warehouse.

Sault St. Marie, Ont., has passed a by-law providing for the installation of a waterworks system.

The Frontenac Gas Co. is to establish a new gas plant at Quebec in opposition to the existing company.

The Fredericton, N.B., Gas Co. are to spend $10.000 this Fall in improving their electric lighting plant.

The Banwell-Hoxie Fence Co., of Hamilton, are to build an addition to their factory to cost $2.500.

Goderich has passed a by-law to guarantee bonds amounting to $150,000 for the Maitland River Power Co.

A new factory is to be established in Brantford to occupy the works to be vacated by the Brantford Screw Co.

The Great Northern and Northern Pacific railways are talking of erecting a $750,000 hotel at Vancouver, B. C.

The Peterborough Shovel & Tool Co. have decided to erect a new brick warehouse, 40 x 100 feet, at a cost of $3,000.

Sir Thomas Lipton is said to intend to spend $2,000,000 in the establishment of a meat packing industry at Winnipeg.

Norwich, Ont., is to vote on a by-law to grant a loan of $5,000 to West, Taylor, Bickle & Co., broom manufacturers.

The McKinnon Dash & Metal Works Co. have reduced the amount of their common stock from $400,000 to $100,000.

The Montreal Street Railway are going to build a power house in the Hochelaga ward, Montreal, at a cost of $801,000.

The Brantford Roofing Co. are installing machinery in their new factory and will be ready to start in a short time.

The Chalmers Milling Co., East Toronto, are erecting a concrete elevator, 40 x 60 feet in connection with their mill.

The Kay Electric Dynamo & Motor Co., have moved to their new factory and offices at 740-142 Yonge street, Toronto.

John Williamson, Ottawa, has placed an order with the Smart-Turner Machine Co., Hamilton, Ont, for a power pump.

The Bell Telephone Co. are to erect a $33,000 telephone exchange in Toronto and another at Kew Beach to cost $5.000.

New York and Edmonton promoters are endeavoring to secure a street railway franchise from the Town of Prince Albert.

The factory of the Brantford Roofing Co., Brantford, is now running to its full capacity, twenty men being employed.

The Canada Machine Telephone Co., who have a competitive franchise in Brantford, have started to install their system.

The Jenckes Machine Co., have ordered three set of shanking crates from the Smart-Turner Machine Co., Hamilton, Ont.

E. Leonard & Sons, London, have ordered an independent jet condenser from the Smart-Turner Machine Co., Hamilton, Ont.

The Climax Road Machinery Co., Marathon, N.Y., proposes establishing a Canadian factory and may locate at Hamilton.

H. McKenzie, Sydney, Australia, was in Peterboro last week securing prices on saw mill machinery for shipment to Australia.

The J. B. Armstrong Mfg. Co., Guelph, have placed an order with the Smart-Turner Machine Co. for a standard duplex pump.

The Smart-Turner Machine Co., Hamilton, Ont., have supplied a girder frame slide valve engine, to Rev. Jos. Oster, Hull.

The Hillrust Grape & Wine Mfg. Co., St. Catharines, have placed an order with the Smart-Turner Machine Co., for a duplex pump.

The Plymouth Cordage Works at Welland are nearing completion and will

be in operation by Sept. 15, employing about 450 men.

The Canadian Northern Railway has purchased the Qu'Appelle, Long Lake & Saskatchewan Railroad, giving them access to Regina.

The Peterboro Radiator & Boiler Co. are asking Hastings for a $5,000 bonus and other inducements to locate a factory in that town.

The C.P.R. is to establish a larger repair shop at Medicine Hat and other improvements will be made to the company's plant there.

E. D. Smith has ordered a duplex pump for his new canning factory, Beamsville, from the Smart-Turner Machine Co., Hamilton.

The Smart-Turner Machine Co., Hamilton, Ont., are building a second automatic spike machine for the Hamilton Steel & Iron Co.

The new power plant at Winnipeg, it is said, will be able to deliver power at $16.31. At present the market price is $35 per horse-power.

Winnipeg proposes to establish a municipal power plant and the city engineer is preparing plans for a power plant at Lac du Bonnet.

Wm. R. Webb, Hamilton, has placed an order for a 5-ton hand-power traveling crane with the Smart-Turner Machine Co., Hamilton, Ont.

Marlatt & Armstrong, Oakville, have ordered an automatic feed pump and receiver from the Smart-Turner Machine Co., Hamilton, Ont.

The American Tobbaco Co. have placed an order with the Robb Engineering Co. for a 125 h.p. Corliss engine for their new factory at Montreal.

The Robb Engineering Co. are building for the Hamilton Iron & Steel Co. a 250 h.p. engine for direct connection to a Westinghouse generator.

James J. Hill is said to be planning a canal from Lake Winnipeg to Lake Superior in order to control the grain trade of the Canadian Northwest.

The Smart-Turner Machine Co., Hamilton, Ont., have received an order for a standard duplex pump from the Polson Iron Works, Toronto.

The Superior Cement Co., Orangeville, Ont., have ordered a 200 horse power Robb-Armstrong engine from the Robb Engineering Co., Amherst, N.S.

The Smart Bag Co., of Montreal, are having a three storey factory built for them near Charlevoix on the main line of the Grand Trunk Railway.

Glencoe has carried a by-law to aid the Fletcher Mfg. Co. to the extent of $3,000, the company agreeing to employ at least 25 skilled mechanics.

The Buffalo Tool & Machine Co., dealers in new and second-hand machinery, are negotiating for a site in Toronto on which to build a large warehouse.

The Smart-Turner Machine Co., Hamilton, have received an order for an automatic feed pump and receiver from Maxwell & Johnston, Toronto, Ont.

The SmartTurner Machine Co., Hamilton, are supplying a duplex double-acting power pump, driven by a gasoline engine, to the Sanitarium at Hamilton.

The Brien Heater Co. organized at Welland recently by Niagara Falls men has secured the factory buildings of the Niagara Metallic Furniture Co. at Welland.

John McCullough, of Joliet, Mont., is at the head of a company who will build a 1,000-barrel per day flour mill at Vancouver, B.C., which will cost $100,000.

The Robb Engineering Co. have received an order from Prof. Jas. Robertson for six 150 h.p. boilers for the Macdonald College at St. Anne de Bellevue, Quebec.

Work has commenced on the erection of the new glass factory at Cayuga, and the contract calls for completion of the first building, 54 x 216 feet, within six weeks time.

The Ottawa Electric Co. and the Ottawa Gas Co. have been consolidated. They will hereafter be operated under one management, but with no change of stock.

E. A. Wallberg, Montreal, has secured the contract for the new 132x364 foot steel and concrete car repair shop to be erected at Moncton, N.B., for the Intercolonial Railway.

The Canadian Northern Railway Co. is adding this season 1,500 box cars, 100 flats and 16 new locomotives to the rolling stock equipment of the western end of their system.

The Canadian Northern Railway has closed a contract with J. T. Schell, M.P., for Glengarry, for the construction of a branch from Hawkesbury to Ottawa, a distance of 55 miles.

The hot blast heating system for the storage building of the Terminal Warehouse & Cartage Co., Montreal, P.Q., is being installed by the B. F. Sturtevant Co., of Boston, Mass.

The Canadian Niagara Power Co. announces that there is no demand in Canada for their power and it is their intention to export all the power produced to the United States.

Application has been made for incorporation of the Perth Bolt & Forging Co. This company has acquired the old bolt works property at Perth. The company is capitalized at $50,000.

The Canadian Cutlery Co. are completing arrangements with the City of London for a factory building, offering various inducements, and the company guarantees to employ 100 hands.

Rhodes, Curry & Co., Amherst, N.S., have secured a contract from the Grand Trunk Pacific for 2,500 cars, the value of which will be $2,000,000. The contract is to run over a term of five years.

Evans, Coleman & Evans, Vancouver, B.C. are to establish a cement plant near Kendall, Washington, to supply the increasing demand of the Pacific Coast owing to the rebuilding of San Francisco.

The Federal Electric Co., Brantford, have the contract for the electrical work on the Plymouth Cordage Works at Welland, as well as on about fifty houses which the Plymouth Co. are erecting for their employes

The Chalmers Milling Co., Toronto, have placed an order with W. Gillespie, 98 Front street east, Toronto, for a 65 h.p. Tangye gas engine and a 75 h.p. Dominion gas producer. These will be in operation about September.

The Robbins Irrigation Co. have entered into a contract to spend $1,000,000 on irrigating a tract of land near the Crow's Nest Pass line of the C.P.R. Canning and beet sugar factories will also be established at Medicine Hat.

The Western General Electric Co., Red Deer, Alta., are enlarging their electric lighting plant and have placed an order with the Robb Engineering Co. for a 250 horsepower compound Corliss engine and Robb-Mumford boiler.

A. Berg & Son, lime brick manufacturers, will locate a factory for the production of lime brick in Brantford, Ont. The works will have an initial capacity of 20,000 bricks per day, but there will be facilities for extension to twice that capacity.

The Verity Plow Co. Brantford, are to erect a three storey addition to their warehouse at Brantford at a cost of $3,000, and a large quantity of modern machinery will also be installed in order to allow the capacity of their plant to be doubled.

An automobile company is to be established at Welland by J. F. Mills, of Buffalo. The company agrees to spend $12,000 in plant and employ forty men in return for certain inducements given by the town.

Montreal capitalists are said to be making arrangements to exploit marl deposits on the White Whale Lake Indian Reservation near Edmonton, for the purpose of establishing a large cement plant.

The American Locomotive & Machine Co. have been awarded the contract for the building of 20 locomotives for the G.T.R., ten of which will be built in the Montreal plant and the other ten in Schenectady. The total cost will be $350,000.

The Hamilton Steel & Iron Co. have decided to build their new blast furnace at Hamilton, at a cost of $250,000. It will be completed by 1907, and according to the bargain the company made with the city its total assessment will be $300,000.

Cornwall has passed a by-law giving a bonus of $20,000 and 10 years exemption to the Modern Bedstead Co., of Sherbrooke, Que., who agree to form a

joint stock company with $150,000 capital, and establish a factory to employ 100 or more men.

The Canadian Manufacturers' Association will hold its next convention at Winnipeg, Sept. 17 to 19. About 300 eastern representatives are expected to make a trip to the Pacific Coast over the C.P.R., returning over the Canadian Northern from Edmonton.

Darling Bros., of Montreal, have installed the Canadian Buffalo Down-Draft Forge System in their forge shop. With this system the smoke is thoroughly removed through underground tile pipes, making the forge shop as clean and pleasant as any other workshop.

English capitalists represented in Canada by J. M. MacKinnon, are to develop a pulp industry at Swanson Bay, on the northern coast of British Columbia. Machinery is now being purchased, and preparations made to get the plant in working order as soon as possible.

H. E. Winters, representing an English syndicate, who is in Canada, says his concern will probably erect three factories, one in Cape Breton, another near Parry Sound, and a third in British Columbia, where "Ammonal," a powerful explosive for use in railway construction, will be manufactured.

The Niagara Falls Machine & Foundry Co. have secured the contract for the grey iron castings to be used in building the furnaces and also for the ingot molds and pits for the Ontario Iron & Steel Co., at Welland. Between three and four hundred tons of castings will be used in the erection of the furnaces.

Contracts have been closed by an influential grain firm with the Northern Construction Co., Winnipeg, for the erection of 10 to 15 modern grain elevators to be ready for the handling of this season's crop. This firm has also commenced the erection of a large storage elevator in Point Douglas for the Canada Paint Co.

The South African Parliament is considering a preferential law allowing rebates on certain classes of goods imported from Canada. Manufactured articles, manufactured iron or steel, cement, etc., are to be subject to a rebate of 3 per cent., and this will go a long way towards paying shipping rates to the Cape.

Beatty & Sons, Welland, Ont., manufacturers of contractor's machinery, having found their present plant much too small for their rapidly growing business, are erecting a new plant which will have a capacity of about three times their present one. The new works are on the banks of the Welland Canal and will have a railroad siding running into them. The new plant will be ready by January, 1907.

Evidences are not wanting that many more saw mills will be built in the course of the coming year in the coast section of B.C. On the Fraser River, near New Westminster, especially, the purchase of water frontage which is adaptable for saw mills has been very active. Eastern and American capital has been investing, and several announcements have been made of projected mills, of which construction may be begun in the near future.

The recently organized Supreme Heating Co. may decide to locate their proposed stove foundry at Toronto Junction, although Owen Sound is the headquarters of the company. The company will manufacture stoves with attachments whereby a complete combustion is claimed to be produced and a large saving on fuel made. The device was patented by W. R. Hampden, recently of San Francisco.

The Kemp Manure Spreader factory, Stratford, owned by the Massey-Harris Co., will be re-opened in the Fall as a binder twine factory. The Massey-Harris Co., unlike the large American implement manufacturers in the United States, has never engaged in the manufacture of binder twine, they buying their supply from the established manufactories. It has now been decided to make their own supply and the Stratford buildings of the company are to be fitted up for the purpose. This will necessitate the installation of a large amount of new machinery.

Orders for a large proportion of the machinery intended for the pulp mill of the Canadian Pacific Sulphite Co., at Swanson Bay, up the coast, have been placed by J. M. Mackinnon, the managing director. A big logging outfit will also be put in to get out logs for the timber necessary to be used in the construction of the mill. The company will build, equip and operate its own saw mill. Two leading members of the company, which is almost entirely British in personnel, Messrs. E. E. Sawyer and John Yale, are now en route to British Columbia to take active superintendence of the work in conjunction with Mr. Mackinnon. All of the members of the company are well-known in financial circles in London.

Thos. Ahearn, president of the Ottawa Car Co., says that negotiations with the Coventry Ordnance Works for the establishment of a factory near Ottawa for the manufacture of heavy guns, are well advanced. His partner, Mr. Soper, returned from England last Monday, where he had been conducting negotiations. The fact of the car company having made many gun and ambulance wagons for the Imperial authorities has encouraged them to embark upon the wider field. The Coventry concern will establish itself in Canada only on condition of the Dominion Government giving a guarantee that all new guns required for the Canadian batteries will be obtained from their Canadian factory.

The Canadian Pacific Railway is preparing to construct a steel bridge across the Belly River, at Lethbridge, which will be one of the largest, if not actually the most extensive bridge, of its kind in the world. It will be one mile in length and 300 feet high, and will be a double bridge with the railway track on the top. Its construction will enable the company to shorten the mileage between Lethbridge and Macleod, as well as to lower the grade, enabling heavy loads to be carried at less cost. Owing to the steel works being so rushed with orders at present it is thought that it will be impossible to obtain the structural material for delivery this season, but the masonry will be proceeded with at once so as to have it in readiness for the girders next year.

* * *

The Labatt Manufacturing Co.

The Canadian Brass & Supply Co., London, Ont., have changed their name to the Labatt Manufacturing Co., with head offices and factory at London and branch offices in Toronto and Winnipeg.

Entirely new equipment has been purchased for the plant, and besides plumbers' supplies the company will now manufacture power and waterworks machinery on a large scale.

The Toronto office has been moved to 367 Queen street west, to provide greater accommodation than the former premises allowed.

* * *

New Plant of the Canadian McVicker Engine Co.

The Canadian McVicker Engine Co., Limited, has been organized in Galt to build the McVicker gas and gasoline engine in Canada. This company will be associated with the Alma Manufacturing Co., Alma, Mich., which was organized some four years ago to build engines on the McVicker patents. This company has now a capitalized stock of $300,000. The Canadian company is capitalized at $100,000, all paid up, and it is expected that within a year this will be increased.

The company has four acres of ground situated on the C.P.R. and Grand Trunk tracks, on which there is now a machine shop built, 48x83 feet, equipped with over $20,000 worth of the latest machine tools and equipment necessary for the manufacture of gas engines, besides which there are the storage building, 30x65 feet, the assembling shop, 30x100 feet, the office building, 22x32 feet, and the pattern and pattern storage building, 30x50 feet, all of which are now nearing completion. The company also have in prospect a finishing and testing shop, 30x100 feet, a foundry building, 50x100 feet, a traction engine machine shop, 50x100 feet, and a traction engine assembling and storage building, 50x100 feet.

The company will at present build engines in sizes from 2 h.p. to 100 h.p., but will ultimately be building in sizes up to 1,000 h.p. In the Fall it is proposed to start the manufacture of double cylinder gasoline traction engines.

A full description of the new plant of the Canadian McVicker Engine Co., together with illustrations, will appear in a subsequent issue of Canadian Machinery.

* * *

New Plant of S. F. Bowser.

S. F. Bowser & Co., manufacturers of self-measuring oil outfits, Toronto, have awarded a contract for the construction of a large new office and factory building on Fraser street, Toronto. It will be a two-storey brick building with basement, 50 x 125 feet. The office and machine shop will be on the first floor

and the finishing department on the second. The machine shop will be driven by individual motor drive, power being generated by steam at the plant. There will be a siding run into the building from the C.P.R.

* * *

Canadian Branch of Berlin Co.

Arrangements have been made whereby the Berlin Co., Beloit, Wis., large manufacturers of wood-working machinery, will establish a branch of their works in Hamilton, Ont. A Canadian company will be formed with a capital of about half a million, of which considerable will be Hamilton investment. A ten-acre site has been chosen and as soon as the company is incorporated building operations will be commenced. Buildings now projected are of the following dimensions: 360 x 50 feet, 250 x 72 feet, 100 x 30 feet, 200 x 20 feet, 80 x 40 feet, and 200 x 180 feet. About 200 men will be employed at the start.

* * *

McGregor, Gourlay Additions.

The foundations of the additions to be made to the plant of the McGregor, Gourlay Co., Galt, Ont., have now been started. One of the additional buildings, 210 x 140 feet, is to be used as a molding shop. The construction is steel, concrete and brick. This building will be equipped with electric traveling cranes and pneumatic tools. The other addition will be a three-storey warehouse building, 204 x 55 feet. These additions will allow the present molding shop and warehouse to be fitted up as an additional machine shop. The company are also installing a new electric power plant and, as far as possible the system of drive throughout the manufacturing section will be independent electric motor.

* * *

Rating of Gas Engines.

In regard to the editorial entitled "Rating of Gas Engines," which appeared in the July issue of Canadian Machinery, the Canadian Fairbanks Co. have written advising us that the Fairbanks-Morse engine, which is now being made in Canada, is subjected to a brake test before it leaves the factory lasting from three or four days to two weeks, and it is rated according to brake horse-power, and not indicated horse-power, and they guarantee that all the engines will develope more than their rated horse-power.

Rating engines according to brake horse-power is the only satisfactory method, and firms using this system are to be commended, while its adoption by all Canadian manufacturers, should be strongly advocated, because only when the system is general will the purchaser be certain of securing exactly what he wishes. Should Canadian gas engine manufacturers as a whole adopt the brake horse-power method of rating it would be a step towards further raising the standard of gas engine manufacture in Canada, and making gas power a still keener competitor of steam and electric power. It would be a means towards increasing the reliability of the gas engine, and would thus assist in breaking down the wall of prejudice which still exists in the minds of many power users against the internal combustion motor.

* * *

Manufacturing New Machinery.

I. E. Shantz & Co., Berlin, Ont., are developing new hand and power pipe threading machines, which the company claim will embody distinctly new ideas along this line. These machines will be exhibited by the company at the Canadian National Exhibition, Toronto, in September.

Descriptions and illustrations of these machines will appear in a later issue of Canadian Machinery, as soon as the machines are sufficiently far developed to warrant photos being taken of them.

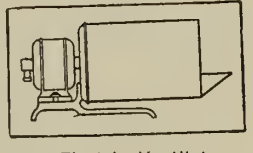
* * *

Addition to Plant of Clark & Demill.

The addition to the plant of Clark & Demill, Hespeler, Ont., has now been completed, and the new machinery installed. This firm manufactures all classes of wood-working machinery and this addition to their plant will greatly increase their facilities for handling their rapidly increasing business.

ELECTRIC VENTILATOR.

A recently invented electric ventilator is operated by a small electric motor contained in the case, with the fan. Air is drawn in through a screen which removes all dust and dirt, and on entering the ventilator strikes a basin of water which cools and moistens the air. For sick rooms small pieces of ice can be put in the water or any desired disinfectant. If dry air is desired instead of the water or ice, use lime, which is a rapid absorber of moisture.



Electric Ventilator.

THE USE OF CONCRETE.

Practically speaking, Canadians have merely begun to realize the importance of reinforced concrete for construction purposes, and in spite of the amount of literature published on the subject, there are many, even in the building trade, who do not understand its application.

In a recent interview, Henry Holgate, vice-president of the Dominion Engineering & Construction Co., and one of the acknowledged Canadian authorities on the use of concrete, gave some interesting information in this regard, which is herewith repeated:

"The extensive use of reinforced concrete," said he, "is a matter of such recent growth in Canada that it is no wonder that the public has not grasped the full significance of its adoption in important structural enterprises. It is only a question of time, however, when its qualities will be as well known as those of brick or stone, which materials it is fast supplanting for building purposes wherever its advantages are appreciated.

"Concrete is composed of cement, sand and gravel or crushed stone. As cement is easily available, and as sand and gravel abound, it follows that concrete can be advantageously made in any part of the country. As concrete possesses in itself great power to withstand compression stresses, it has proved of tremendous value in building canals, retaining walls, and all manner of construction work where it is not subjected to great tensile stresses. When a structure is designed to meet tensile stresses, like a skyscraper or a large factory, it becomes necessary to use in connection with the concrete some materials capable of taking up this additional burden. Steel does this to the best advantage, and when employed in conjunction with the concrete, furnished the combination known as 'reinforced concrete.'

"Concrete alone is cheaper than stone or brick, but steel is extremely expensive, so that the problem confronting the man who designs a structure of reinforced concrete is how to use the minimum of steel and yet get out of it the maximum of strength. He aims to distribute his reinforcing rods in such a way that each will supplement the other and all will supplement the concrete. If he does this successfully he produces a monolithic structure in which every strain and stress, no matter how great, is distributed through and borne by the whole.

"As soon as architects, engineers and contractors began to use reinforced concrete for complicated work, numerous methods of reinforcement were invented. All these methods aim to increase the load-bearing power of the concrete and to insure accuracy of construction, and all have their advocates. It can not be doubted, however, that the best mode of procedure is to design the reinforcement not only so that it will fill its own function efficiently, but so that it will contribute its proper part toward strengthening the structure as a unit.

"It goes without saying that skill and experience in the use of reinforced concrete are requisites without which no successful structure of this kind can be either designed or erected. Not only must the design be without flaw, but the actual construction work must be done under the closest supervision to insure reliability. The reinforced concrete structure once successfully completed will stand practically forever, for the older concrete grows the harder it becomes. One of its most important attributes is its resistance to fire. To all intents it is fireproof. Steel is not, but imbedded in concrete steel is so well protected that the combination, or reinforced concrete, is as fireproof as concrete alone. This was the great lesson taught by the San Francisco disaster and by the Baltimore fire. The fire-resisting quality of concrete carries its own sequel; insurance rates on concrete structures are so low as to be almost negligible. In connection with its use with steel, concrete has another remarkable and unique advantage; it protects the steel absolutely from rust — something that no other material yet discovered has been able to do."

PERSONAL MENTION.

Mr. J. C. Royce, S.B., consulting engineer, Toronto, is at present in Europe investigating the recent development of the gas engine and producer gas plant, and also the independent motor drives for railway cars now in use on some of the English railways. Mr. Royce sailed for England on July 6, and will probably visit France and Germany before returning to Canada towards the end of August.

Mr. D. M. Murray, of the Chapman Double Ball Bearing Co. of Canada, Toronto, is away on a month's business trip to Quebec and the Maritime Provinces.

TO ELECTRICAL ENGINEERS.

ONE of the oldest European electrical manufacturing companies, having five works in different countries, and whose name, exceptional reputation and experience are known throughout the engineering circles of the world, is desirous of appointing representatives in British North America. It is considered that responsible agents with sound technical knowledge and used to big undertakings can undoubtedly handle its leading lines with success, notwithstanding the existing competition from Canadian firms. Applications emanating from well-established engineering firms, having branch offices in the different cities of Canada, will alone be considered. Replies to be addressed to Box 49, CANADIAN MACHINERY, Toronto. [9]

HYDRO-ELECTRIC Power Commission of Ontario desires the services of an electrical engineer. The position will be of at least several years duration. Applicant must be scientifically trained, with wide experience in high-tension power transmission and sub-station practice; highest qualifications covering construction, operation and administration absolutely necessary. Applicants must give references and salary expected; also full authentic statement covering nationality, education, age, availability, and details of work done and positions filled. Applications received not later than July 31st, 1906. Gordon Sproule, secretary, 25 Toronto St., Toronto, Can. [8]

BUSINESS CHANCES

INDUCEMENTS SOUGHT—A firm employing over a hundred hands, would like to get full particulars of inducements offered by Canadian towns and cities to branch of reliable and well established concern. Reply to Manufacturer, c/o CANADIAN MACHINERY, Toronto. [8]

FOR SALE.

DYNAMO—Manufactured by the Canadian General Electric Co., Limited; Thompson-Houston system; patented 1893; Class "A1" 120, No. 1527; speed, 1,070 revls.; volts full load, 2 308; no load, 2,080. Apply to the Corporation of the town of Magog. [8]

SASH and door factory, running every day; situated on the O. and N.Y. Railroad, twenty miles from Ottawa. For further particulars enquire W. C. Millar, Russell, Ont. (9)

ELECTRIC light plant for sale—Steam power; thriving town; Eastern Ontario A snap if sold quick. Address J. G. Delong. lock box 120, Elgin, Ontario. (9)

MACHINERY FOR SALE.

BRICKMAKERS—Write us for particulars of our open air and exhaust steam dryers, trucks, automatic cutting tables, disintegrators; we have the following second-hand machinery for sale, all in good repair: 1 steam power Quaker brick machine, 1 tumbling barrel for grinding bats into sand, second-hand 4x12 boiler, 16 h.p., stationary engines, slide valve. Bechtels, Waterloo, Ont. [7]

SAND LIME BRICK PLANT—H. W. Petrie is offering for immediate possession a modern plant, equipped throughout with best possible obtainable machinery for manufacturing sand lime brick; we have an interesting proposition for the right party that will stand looking into. Address H. W. Petrie, Toronto and Montreal. [7]

PROPERTY FOR SALE

FACTORY site or subdividing property; 26 acres or 200 lots; in Industrial St. Catharines; clean, level, dry, square block; inside city; water and rail facilities; electric line passes property; cheap electric power and natural gas; exemptions; best labor conditions; bargain; W. B. Clark, trustee, Port Dalhousie, Ontario. [8]

FACTORY PREMISES FOR SALE—Near Toronto; four-storey solid brick; about five acres land; railway siding; outbuildings; engine, boiler; sacrifice for immediate sale. Apply, J. J. McKenney, 43 Victoria street, Toronto. [8]

POSITION WANTED.

YOUNG MAN—Graduate of the Institute of Mechanical Engineers, with four years' practical mechanical experience, would like position in the mechanical line that would offer good future prospects. Best British references. Address Box 210 C, CANADIAN MACHINERY, Toronto. (8)

THE POINT IS THIS :

You want to read the best of current literature without having to buy all the magazines and having to run through hundreds of pages in search of one **GOOD** page.

But there are those who will do this for you at a minimum cost, we do it

The product of our work is this :

The Busy Man's Magazine

an epitome of the world's best thought.

If an article with lots of body to it, appears in one of the leading magazines that article will also appear in **THE BUSY MAN'S MAGAZINE**. The same as regards choice bits of humor, vivid sketches of men and events and commentaries on things and conditions of more than passing interest. The contents are varied but all selections are **select.**

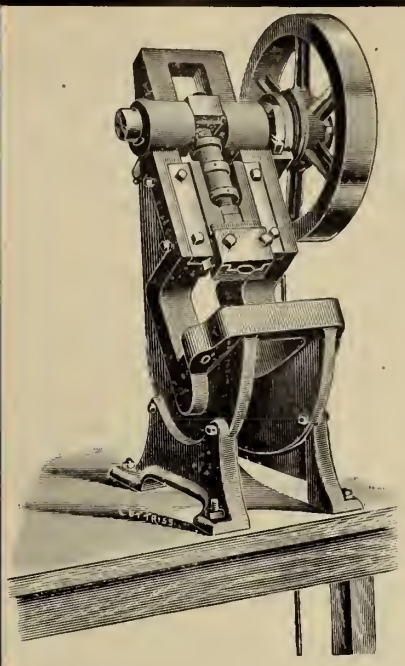
Send for Sample Copy

Any subscriber to Canadian Machinery can get The Busy Man's Magazine for **one year** for $1.50.

Send in your subscription **now.**

The MacLean Publishing Co., Limited

Toronto



POWER PRESSES

Canadian Made

ALL SIZES

For Stamping of all kinds

Equipped with instantaneous four-point clutch

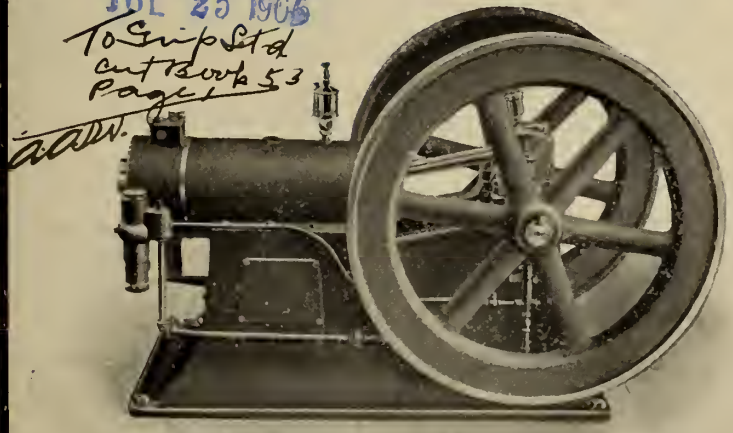
Also Tinsmiths', Cornice Makers', Metal Workers' and Canners' Machinery.

Manufactured by

Brown, Boggs & Co., Limited

Hamilton, Ont.

The Famous McVicker



One third the number of parts.

The only four cycle engine that will run either way.

The only improvement in gas engines for forty years.

Governor ten times as sensative as any other. No gears, cams, eccentrics or trigger work of any kind.

The Canadian McVicker Engine Company LIMITED

TORONTO AND HAMILTON ELECTRIC CO.

HAMILTON, - ONTARIO

Here is Something Worth While

A Remarkable Opportunity to **Manufacturers** and **Users** of **Machinery** to invest a dollar to advantage.

The manufacturers problem is to sell goods in the most economical manner. No magazine has heretofore been published to teach the maker to sell machinery and allied lines until

SELLING MAGAZINE

was issued three months ago in New York. It is a strongly edited aggressive publication with a field of its own. By special arrangement with the publishers we are able to supply it with

CANADIAN MACHINERY

for one year for **one dollar,** which is the price of each separately.

Clip off the corner coupon and sign, making sure to mention what line of goods you manufacture, and send same to

MacLean Publishing Co.,

Toronto, Ontario

MacLEAN PUBLISHING CO.
Include undersigned firm in your list to receive Canadian Machinery and Selling Magazine for one year for one dollar.

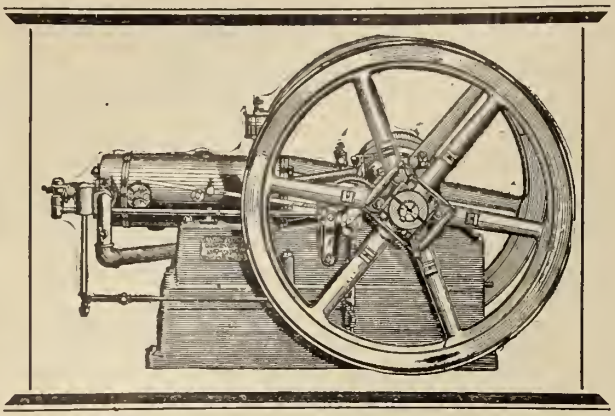
Dependable Power

THE KIND YOU NEED



There is no better power available—

No more economical, steady and dependable power—

No power that will increase the capacity and decrease the cost of production so effectually—as that afforded by an

I.H.C. GAS AND GASOLINE ENGINE

Any man of ordinary intelligence can run an I.H.C. gasoline engine without previous experience.

We would like to show you how much more simple they are than any other engines made—how much more easily they are operated and kept in perfect running order and why they develop more power from the same amount of fuel.

We illustrate and explain these points and every other detail in our complete catalogue. Every man who uses power or contemplates installing It ought to get this book.

You will find that the I.H.C. line of engines includes just the style and the size best suited to your requirements.

Guaranteed to develop rated horse power.

Adapted to the use of gasoline, gas or denatured alcohol.

I.H.C. engines are made in the following styles and sizes :

Horizontal Engines—
Stationary—4, 6, 8, 10, 12 and 15 H.P.
Portable— 6, 8, 10, 12 and 15 H.P.
Vertical—2, 3 and 5 H.P.

Wayland Williams & Dadson

321 St. James St., MONTREAL

Sylvester Gasoline Engines

Are the best that skilled labor can produce.

They are easy starting; they are simple and reliable; they will give full power in the coldest weather. Made in sizes from 4 to 32 horse power in portable snd stationary and from 1½ to 12 horse power in marine. They will run on gasoline, coal oil or distillates.

The SYLVESTER Engine inspires confidence because it is so simple in construction. It is the cheapest engine to buy because there is nothing to get out of order.

The SYLVESTER Engine is handsome in appearance, substantial in construction, marvelous in simplicity, unequalled for effectiveness and durability.

THE HIGHEST AND MOST PERFECT TYPE OF GASOLINE ENGINE BUILT.

If you require to purchase, write for Catalogue and our 1906 Calendar. We will then send our Travelling Salesman to you

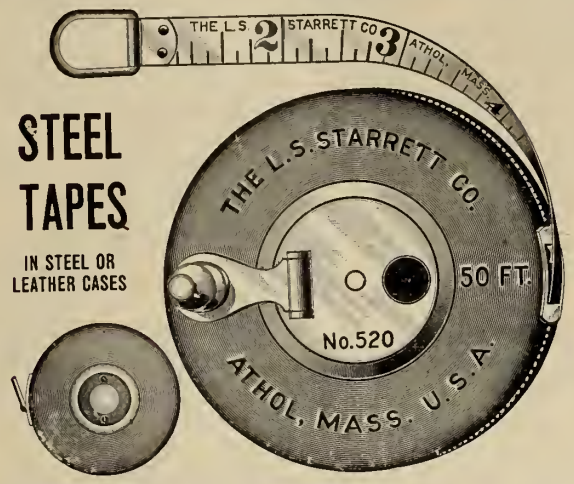
STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH



STEEL TAPES

IN STEEL OR LEATHER CASES

In our tapes the figures denoting feet are smaller than those denoting inches. Two reasons for this :

This dissimilarity of figures materially lessens (in fact ought to entirely prohibit) the liability to erroneous readings that frequently occur through the uniformity of all figures in steel tapes of other makers.

The smaller figures, denoting feet, allow the graduation line under each to be plainly visible, instead of being obliterated by the usual larger figure.

Graduated in feet, inches and eighths of an inch, or in feet, tenths and hundredths of a foot.

"Little Giant" Drills made in 13 sizes

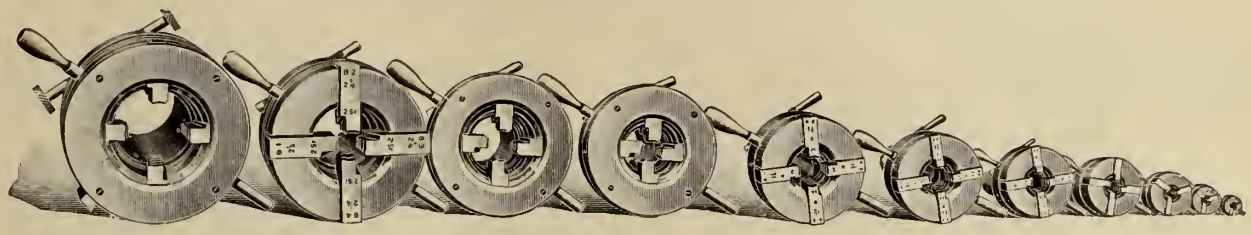
Our Corliss Valve Drills are the most powerful Air Drills ever made, weight considered.

Chicago Stay Bolt Chucks avoid the squaring of ends. They are very rapid and efficient.

"BOYER" and *"KELLER"* Riveting Hammers

The Best Tools Ever Devised

for cutting **Duplicate Threads** of any diameter, on iron, steel, bronze or brass, are the **Geometric Self-Opening Screw Cutting Die Heads.**



SIZES TO SUIT EVERY REQUIREMENT.

Our Style "D" Die Head cuts right or left hand threads of any length—standard or special pitch. A micrometer adjustment assures the greatest accuracy and speed in changing the diameter of the threads. Dies are operated automatically by stopping the travel of the turret slide. Overcomes all the disadvantages of a solid die. Saves a lot of time when used on screw machines, turret lathes and the carriage of an engine lathe. If you want to reduce cost and increase output, send sample or blue print of your work—we will tell you size and price of the tool you need.

Champion Lathe Tools

THE FINEST AND BEST LATHE TOOLS ON THE MARKET

Offset Tool Holders ***Inside Tool Holders***

Champion Boring Tools

Square Thread Tools ***Champion Expanding Mandrels***

CHAMPION TOOL HOLDERS—A few of the distinct advantages claimed are: It has a good support under the cutting edge of the machine which makes the tool last twice as long as any other make by the material not mashing down so quickly under the continual strain of the cut. It makes a much heavier cut, allows using the ends of the cutters closely, and prevents the cutter from chattering.

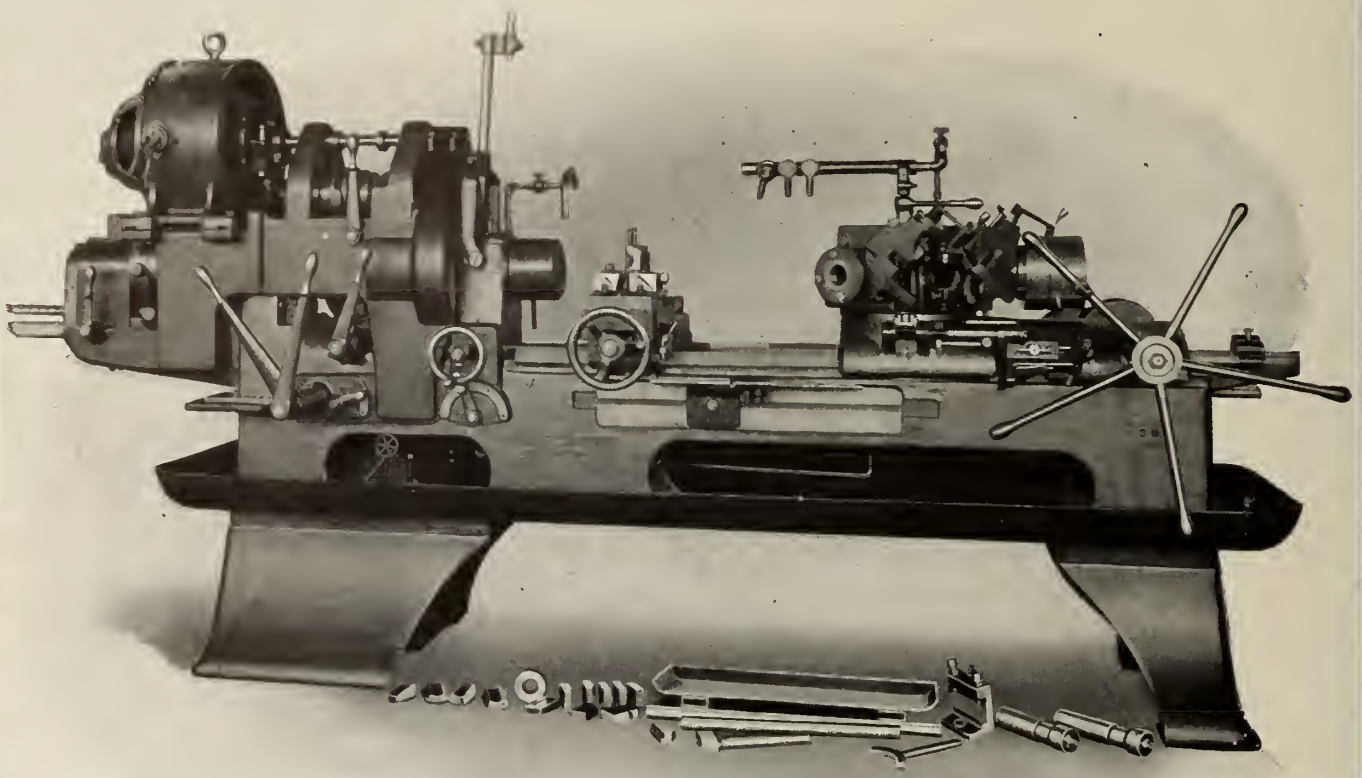
THE JOHN BERTRAM & SONS COMPANY, Limited

DUNDAS, ONTARIO, CANADA.

TURRET LATHES

FIVE SIZES, $\frac{5}{8}$ x 4½-inch, 1 x 10-inch, 1½ x 18-inch, 2 x 26-inch, 3 x 36-inch.



3 x 36-inch Pratt & Whitney Turret Lathe, driven 5 h.p. motor.

The motor drives through a speed-box which, with the double friction back-gears, affords a wide range of speeds.

Cross and longitudinal power feeds are positive geared, reversible, and have automatic stops in either direction.

The cross slide permits the use of larger forming tools than can be held in a turret and makes possible the use of three turret tools at one time.

The Lever You Want Right At Your Finger-Tips

Stop running "round" to the back of your machine for a lever that you use from 1 to 20 times a day.

Everything Within Easy Reach of the Operator

This is what we claim for this new 30″ **BICKFORD RADIAL**—in fact for all our Radials. And we can prove it, too, not by argument or glib assertion, but by actual demonstration. Look at the cut—did you ever see a handier, neater or more stockily built Radial in your life?

And it's just the thing for taking care of the ordinary work as found in the average shop—it was built for that purpose, you know.

Then, again, we want you to put in the little Radial in place of the large Upright you were thinking of buying. It doesn't cost much more, has infinitely greater productive capacity and will out-last and out-drill any Upright ever built.

It's made in three lengths of arms, remember, 30″, 36″, and 42″.

No. 1-14 Cutter and Reamer Grinder.

WE HAVE A FEW OF THESE MACHINES READY FOR IMMEDIATE DELIVREY

This machine is distinctly a cutter grinder, and was designed to fill the want for a machine to sharpen milling cutters of all kinds and shapes, without special fixtures or special-shape emery wheels, being heavy enough to eliminate all vibration and still be easily operated. It weighs about 1370 lbs. The table, which has a long bearing on the saddle, has a longitudinal feed of 20 in., cross adjustment of 7 in., with a vertical adjustment of 6 in. Cutters 1 in. to 14 in. can be taken between centres. The table can be used at different angles with the spindle in horizontal plane, by swiveling the knee around the column. The machine is compact, durable, adaptable and a necessity for the busy shop.

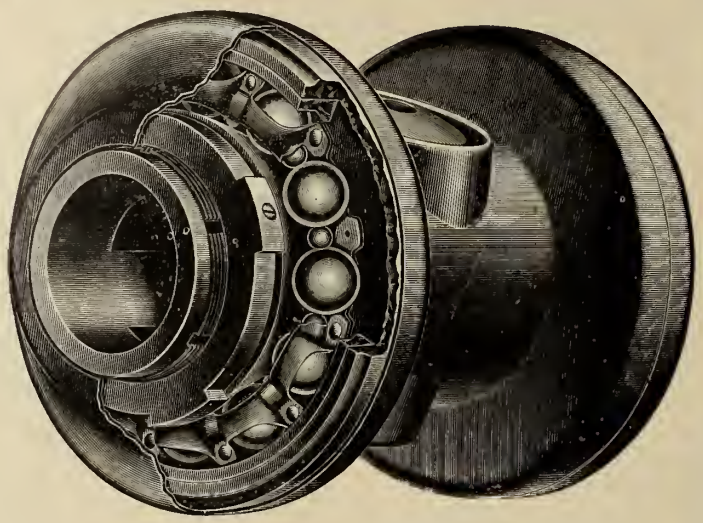
CHAPMAN DOUBLE BALL BEARINGS

Should You Not Use Them When You Can

Save

- 75% Shaft Friction
- 95% Lubrication
- 100% Re-babbitting
- Wear and tear on belting.
- Danger of Fire from Hot Boxes.

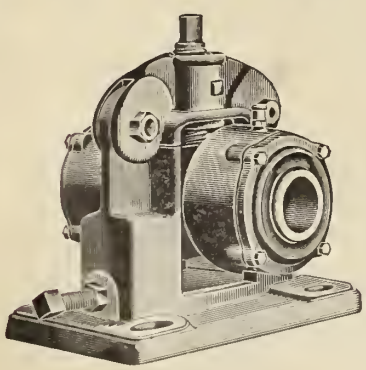


Let us tell you what it will cost to make these savings for you.

THE CHAPMAN DOUBLE BALL BEARING CO. OF CANADA, LIMITED

OFFICE—39 SCOTT STREET. TORONTO.

If a Little Leak Will Sink a Big Ship, What Will a Big Leak Do In a Machine Shop?



You can't make money unless you save money. You can't save money unless you make money. Isn't that so?

There will always be two manufacturing costs—labor plus material.

With that portion of labor which relates to your machinery equipment we wish to deal.

Your men may be skilful and careful and yet not be profitable to you, and why? Because perhaps only a portion of their skilfulness and carefulness goes into the material. The rest goes into the air. Its name is **waste**.

But give these same workmen an equipment where

DOMINION HENDERSON BEARINGS

play part and there will be a different story to tell. Dominion Henderson Bearings make shafts, belting, pulleys, hangers run easy, smooth and true and where you get easy running, smooth-running, true-running machinery you have no wastes.

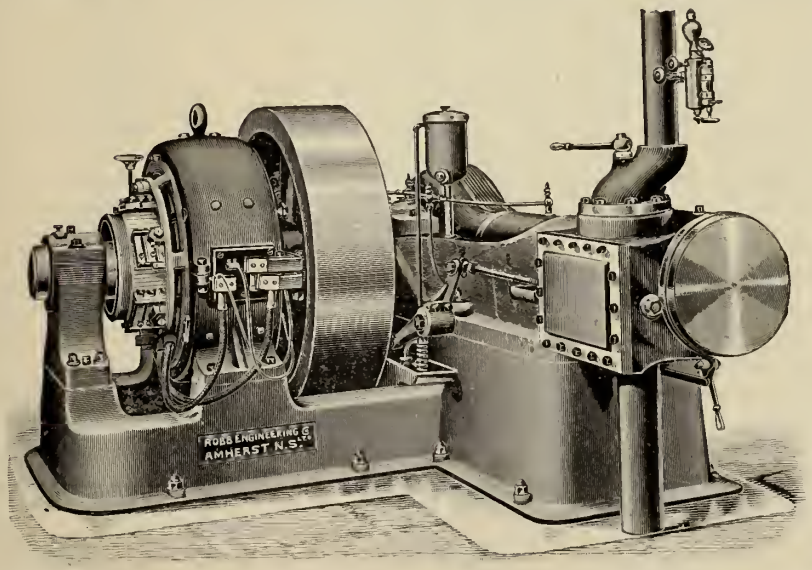
Not One Cent for Repairs!



An Experienced Engineer writes us as follows:

"After eighteen months of hard service, the 'Robb' engines are in excellent shape, running very smooth and without a bit of vibration. Up to this time they have not cost one cent for repairs, the only expense being for steam, oil and packing, and this lower than the average. Perfect alignment, parts well machined and good design, make the 'Robb' the most economical and labor-saving engine that has ever come to my notice."

Machinery at the Fair

Canada's National Exhibition at Toronto Shows New Features

WITH the opening of the great exhibition at Toronto this year under the most favorable weather conditions possible it was evident that this, the greatest exhibition of Canada, was to have the greatest year in its history. The most notable new feature in connection with this year's undertakings is the splendid new Process Building, which surpasses any building that was ever built for any exhibition. It is of brick and steel with metal roof, and makes a big addition to the exhibiting capacity of the fair. It has afforded manufacturers an opportunity of showing the interested public how different lines of goods are manufactured. Here may be seen such processes as making shredded wheat, baking bread, buns, cake, etc., making candy, mixing dough, printing, weaving carpet, glass cutting and machine tool operating, as well as the production of producer gas and the operation of gas engines therefrom.

This last feature is the most striking connected with the mechanical part of the whole exhibition. For the first time in the history of the fair these have been shown and in working order. In the Process Building one producer plant is running a dynamo supplying a large number of display lights, while another drives a shafting, with small coal consumption, for one side of an entire wing. These have naturally come in for a good deal of attention and created no small interest, being the first opportunity the large majority of people have had of seeing them in operation. In conjunction with producer plants the surprisingly large number of gas and gasoline engines shown are somewhat of a criterion to the importance of these prime movers in industrial pursuits. At every turn the visitor is confronted with an exhibit of gasoline engines of various sizes and makes; many of them are in operation and come in for perhaps more attention than any other feature of the exhibition.

The building of the new Process Building has shown more clearly than ever the inadequate quarters supplied by the management for machinery exhibits. In the machine tool line but three firms had machines and of these only one was Canadian. The exhibitors have complained that it is almost impossible to handle machinery in the present building. A year ago it was rumored that a new Machinery Building was under consideration. It is hoped for the sake of the present machinery exhibitors and probable future ones and for the standing of the exhibition as well that the matter will be taken up and before another year a building commensurate with the importance of the machinery trade erected.

Reliance Gasoline ngines.

Owing to the short time since the Labatt Manufacturing Co., of London, took up the manufacture of the celebrated Reliance engines, their exhibit in the north wing of the Process Building is less extensive than would otherwise have been the case. This engine is well known throughout the United States and celebrated for the various desirable features. In this exhibit are shown running two vertical stationary engines, one of them being 3 h.p. and the other 5 h.p. Mr. Frost, who has had many years' experience in machinery lines in the United States, is looking after the exhibit. At the London exhibition during the week commencing September 7 the Labatt Manufacturing Co. expect to have a number of their engines, both stationary and portable, in operation, and will show their output on a much more extensive scale than was possible at the present time.

Canadian National Exhibition—Mechanical Figure at Main Entrance of Manufacturers' Building.

Machine Tools.

Among the most interesting of all exhibits in the Process Building is the operation of two machine tools by experts. These are shown in the exhibit of the Canada Cycle & Motor Co., being a Gisholt lathe manufactured by the Gisholt Machine Co., Madison, Wis., and a Landis grinder made by the Landis Tool Co., Waynesboro, Pa. Mr. Chas. Spalding is representing the Gisholt Co. and the interests of the Landis Tool Co. are looked after by Mr. T. H. King. Every day the experts on these machines demonstrate to the curious public the marvels of the modern machine tool as regards accuracy of work and speed.

The Gisholt lathe is one of the latest patterns and can be used to great advantage in almost any kind of lathe work. Its accuracy and rapid work are two of its strong features. Its operation at the exhibition consisted of cutting out piston rings, four at a time to a limit of variation within four one-thousandths of an inch. The grinder operated on the drop forge nickel shaft from the rough casting, being a No. 4 machine, particularly for that purpose. This is the most modern type of Landis grinder, so sensitive that a practically perfect measurement can be obtained. The crank shaft of the engine receives the shock of every forward impulse and has to transmit it to the driving shaft Its strength must be beyond question and as it has seven bearing surfaces its perfect machining is an absolute necessity. This machine gives every bearing surface a high polish and a surface accuracy to the one-thousandth part of an inch. It is the intention of the Canada Cycle & Motor Company to grind all pistons and cylindrical parts with this machine.

H. W. Petrie's Machinery Exhibit.

A valuable addition to the exhibits in the Machinery Hall is that of H. W. Petrie, Toronto. The display is without doubt a very handsome one from an artistic standpoint, and also a very appropriate one from a purely business standpoint. Neither expense nor trouble have been spared in making it a decidedly attractive exhibit, and those responsi-

ble for it have been amply repaid by the many expressions of appreciation which the exhibit has called forth.

The exhibit is quite representative, including as it does iron and wood-working machinery, grinders, threading machines, steam, gas and hot air engines. The two most striking features of the exhibit are the Lodge & Shipley improved patent head lathe and the fore and aft compound condensing marine engine, 6x12x9. This lathe is built for use with high speed steel, and tests are being made during the exhibition to determine what the lathe will do in the way of speed and feed when cutting different metals with high speed cutting tools. The marine engine is also undergoing a test in that it is continually running.

Wood-working machinery is represented by a Petrie west side band saw, suitable for furniture, novelty and like factories. Besides the lathe, iron working machinery is represented by a McDougall pipe cutting and threading machine, by a Petrie pedestal grinding machine, which is used to grind the tools for use on the lathe, and by a Phoenix centreing machine. Power machinery is, however, the best represented. In addition to the marine engine before mentioned there is a No. 1 Jewel automatic engine, 8 h.p., operating the band saw, which engine is made in sizes up to 75 h.p., and there is also a Petrie vertical steam boiler, a gas engine and a Rider-Ericsson hot air engine and pump, operating continuously. The gas engine is certainly worthy of special attention. The engine ex-

hausts into a muffler standing on the floor and from thence the exhaust comes right into the building, the puffs from which can be felt by placing the hand over the exhaust port, but which can be neither seen, smelt nor heard. This, of course, is a proof of the perfect combustion in the engine. Another important feature about the engine, besides the perfect combustion and noiseless operation, is the wide range of speeds which can be obtained, from 100 to 600 revolutions per minute, change of speed being made when the engine is in motion. This engine is known as the Imperial.

While special attention has been devoted to large machinery, small tools and supplies have not been forgotten, and in a show case has been made a handsome display of small tools and supplies of all kinds for engineers, machinists and mill men.

All considered the exhibit is a very creditable one to H. W. Petrie, and while exhibition visitors are being shown the different points of interest about the exhibit, they cannot fail to notice the courteous treatment received by all comers from those in charge of the exhibit.

Economical Mfg. & Supply Co.

A new exhibitor in the Machinery Hall this year is the Economical Mfg. & Supply Co., Limited, Toronto, who are

exhibiting the line of goods they themselves manufacture and also some of the products of the New York Belting & Packing Co., whose Canadian agents they are. From the accompanying illustration the style of the exhibit may be seen. The exhibit consists for the most part of a display of their boiler compound, belt dressing, graphite paint, graphite grease, lubricating graphite, graphite stove polish, etc. The foundation of these preparations is "Canada Graphite." This graphite is the amorphous graphite in which form graphite is very adhesive and for that reason makes an excellent lubricating factor in that it fills up all the little crevices and makes a very smooth surface. As a paint this graphite forms an excellent preserver of wood, iron and steel.

The safety hollow set screw is an important feature of the exhibit and undoubtedly users of set screws would be interested in seeing the many good points of this one. It is only very recently that the company have started to turn out these screws because of the difficulty experienced in getting a machine to "draw" the hollow from the steel blanks, but after this considerable attention will be given them.

The product of the New York Belting Co. exhibited consists of packing of different kinds very neatly displayed, but the Economical Mfg. & Supply Co. handle all their goods, including packing, pump valves, hose, belting and rubber goods of different kinds.

A sample of the lubricating graphite may be obtained at the exhibit, which might well be used to test the claims made for it as a lubricant.

Suction Producer Gas Plant.

The rapidly increasing interest in producer gas as a form of power, which has been evidenced during the past year, is remarkable, and in view of this it is only natural that manufacturers of producer gas plants should go to considerable trouble and expense to bring the merits of producer gas to the attention of the public at the exhibition. An exhibit like that of the Economic Power, Light & Heat Supply Co., 40 York street, Toronto, has not been before seen at the exhibition. A 40 h.p. Pintsch suction gas producer supplies gas for a 20 h.p. National gas engine, and to the gas engine is belted an electric generator, which supplies power for the lighting of several of the exhibits throughout the Process Building, in which building the Economic exhibit is situated. The economy of these suction producer gas plants has been the talk of power users for some time, and the Economic Power, Light & Heat Supply Co. are going to take advantage of this opportunity of demonstrating what the Pintsch producer will do along that line, that is if they can get sufficient load to run the engine economically.

This company are preparing to manufacture the Pintsch producer and the National gas engine in Canada, the gas plants and the engines which they now have in stock having been brought over from Germany and England respectively.

These producer plants are built in sizes from 4 to 2,000 h.p., it being possible for more than one engine to be supplied from the one producer by means of the Pintsch automatic governor, which prevents the suction force through the producer from varying, without reference to the number of engines which are running. The operating abilities of the National gas engine working on producer gas may be judged by the results of a test made at Derby by the Royal Agricultural Society of Great Britain a short time ago. The various English builders were invited to compete at this test, the prizes being a gold medal for the best engine and a silver medal for the second best engine, the awards to be made on the basis of the following considerations: Attendance required, the general design with respect to accessibility and compactness, regularity of working, fuel and water consumption, price, relative proportions of producer and engine, and the ratio of the volume swept by the piston to the brake horse-power. The results turned out well for the National gas engine and producer, they being awarded the gold medal. The coal consumption during these tests was remarkably low, being 0.84 lbs. per brake horse-power in the full load test, and 0.91 lbs. per brake horse-power in the

half load test, the duration of the test being 10 hours on a unit of 10 horse power.

Canadian National Exhibition Part of Fairbanks Co.'s Exhibit.

Canadian Fairbanks Exhibit.

The exhibit of the Canadian Fairbanks Co. in the Machinery Hall is as usual divided into two sections, one devoted to the products of the Fairbanks-Morse Canadian Manufacturing Co., that is, to gas, gasoline and oil engines, electrical dynamos and pumps of various kinds, and the other to the Fairbanks scales, valves and similar products. In addition there is the reception room, where weary exhibition sight-seers are welcome to rest, and where a platform scales is at the service of all comers. Those in charge of the exhibit are exceptionally courteous in explaining and demonstrating the various machines exhibited.

In the engine section are shown horizontal and vertical engines, both portable and stationary. A vertical electric lighting engine, governed by a throttling governor, runs a 6 h.p. Fairbanks-Morse dynamo, which supplies the power for the lighting of the exhibit and sign. There is also in operation a horizontal engine for general power purposes, where there is a varying load. This engine is provided with a hit-and-miss governor. The portable engine and the threshing engine have attracted considerable attention, they being the class of engines sold to the farming community, with which community the Fairbanks Co. do a very large business.

A prominent feature in the exhibit is the valve chair, a chair built up of standard Fairbanks valves. The particular feature of interest in these valves is the removable oscillating disk, which can be removed and replaced with very slight trouble. The valve seat is designed so as to prevent as far as possible the lodging of grit which would cut the seat or disk. The valve seat is made of a special composition of brass and phosphor-bronze, and the disk is made of phosphor-bronze. There are several other interesting features about this valve, and to those not acquainted with it, it would be well worth investigation.

The scales form an important and interesting department of the exhibit, there being displayed scales of all kinds and for all uses. These include trip and even balance scales, railway scales, flour and grain scales, postal scales and agate bearing scales. These agate bearing scales have attracted special attention because of their very fine adjustment.

The exhibit of wood split pulleys and iron split pulleys is also worthy of special attention because of the construction of the wood split pulleys. As well as being glued together the segments are riveted together, and this prevents the pulley from coming to pieces in factories where the atmosphere deteriorates the glue, as in canning factories, etc. There is also a special construction for bracing the rim from the hub of the pulley, which is not contained in any other wood split pulley.

Exhibit of Transmission Machinery.

Transmission machinery and devices of all kinds form the exhibit of the Dodge Mfg. Co., Toronto, the Dodge wood split pulleys, as usual, occupy a prominent position. Shafting and countershafting, tight and loose pulleys, bearings, friction and other clutches, shaft pedestals and hangers, a rope drive device, wood split pulleys and iron split pulleys, muff and flange couplings and all similar products are there exhibited, giving ample evidence of the character of the product of this firm.

Canadian National Exhibition.—Exhibit of Dodge Mfg. Co., Ltd., Toronto.

The exhibit of rope drive is very interesting, extending as it does from one side of the exhibit to the other, and showing the means of keeping a constant tension on the rope. The endless method

of rope drive is always recommended by this firm in preference to the individual endless rope for each groove in the pulley.

A special demonstration of the smooth-running qualities of the Dodge bearings is made by a drive of one countershaft by another by means of a small cord over the pulleys. On the same countershafting is given a practical demonstration of the operation of the Dodge friction clutch.

At present the plant of the Dodge Mfg. Co. is running day and night, so busy are they turning out their product, but there is a special demand for their wood split pulleys on the English market, and for that reason the department of the factory devoted to that product is exceptionally busy. So rapidly has the demand for their product increased of late that extensions of plant are now being considered.

Canadian National Exhibition—The Chapman Double Ball Bearing Exhibit.

Chapman Ball Bearings.

One of the attractions of the Machinery Hall is the exhibit of the Chapman Double Ball Bearing Co., of Toronto, where the merits of this desirable bearing in reducing friction are strikingly demonstrated. Perhaps the most notable feature of this exhibit is a mining car of the Dominion Coal Co. filled with anthracite coal, the gross weight of which is 5,500 lbs. The truck is fitted with Chapman bearings and mounted on tracks running along the side of the booth. The ease with which this heavy car glides back and forth on the track under a slight pressure of the hand is convincing proof of the efficacy of the bearings. In actual use it has been decided by mining companies in Canada that thus equipped, double the amount of coal or ore can be handled with the same labor than previously possible.

Along the centre of the exhibit are arranged about a dozen shaft hangers of different standard makes, showing the adaptability of the ball bearing to any of these. A pyramid of different sizes of wood loose pulleys mounted on a vertical shaft is another of the features of this interesting display and one which affords delight to the small boy, who never tires turning them and then watching to see how long they will run. He generally grows impatient long before they have ceased moving and speeds them up. The pulleys are not the only object in motion, for a carriage wheel and an automobile wheel are also mounted to show what a saving in the power and with what ease they turn. Besides a mule stand equipped similarly to the others are shown ball bearings for traveling cranes, marl cars, and thrust bearings.

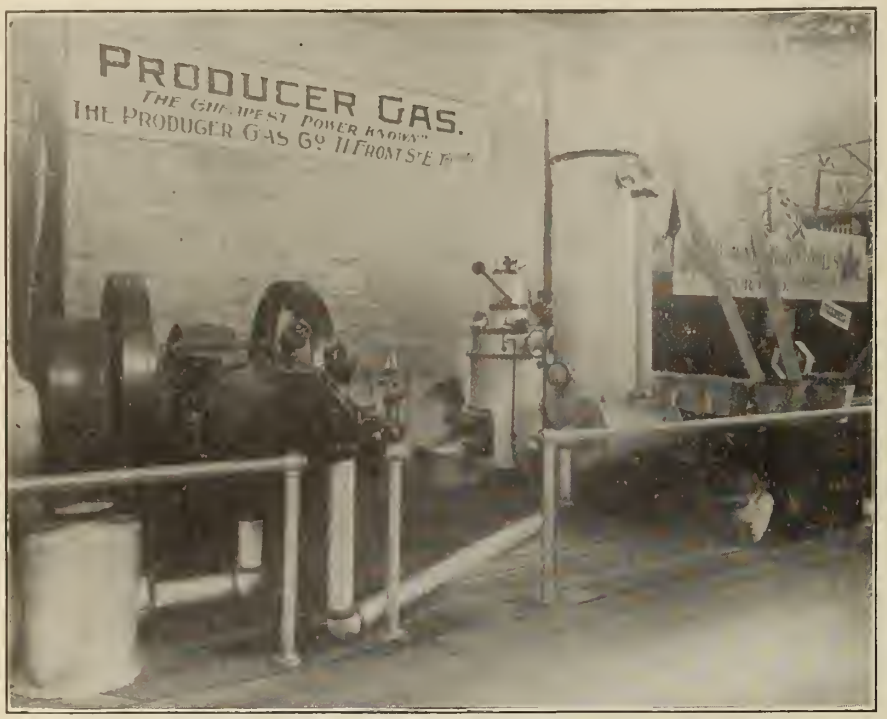
It is interesting to note that the entire shafting on both sides of the Machinery Hall is equipped with Chapman double ball bearings. By actual test it was shown that on adopting these a saving of 80 per cent. friction was effected. At the present time there are 400 factories in Canada using these bearings.

The exhibit was in charge of Mr. C. M. Murray, who was kept busy answering questions by people interested in these power-saving devices and explaining in his courteous manner the many and varied applications for ball bearings.

A New Rotary Engine.

A new exhibitor in the Machinery Hall is the Manson Mfg. Co., Thorold, Ont. This company has but recently been organized and is now making application for an Ontario charter. The object of the company is to promote and manufacture a modification of the "Tree" rotary engine, which engine was recently being placed on the market by

the Imperial Engine Co. The Manson Mfg. Co. have taken over the Thorold Foundry & Machine Co. The engine on exhibit is a 35 h.p. one, running a



Canadian National Exhibition—The Producer Gas Co., Toronto.

30 k.w. dynamo, which supplies the power for the lighting of the exhibit The chief points claimed for the engine are economy in steam consumption, in oil consumption, and in floor space. Besides building this engine as a steam engine the company are adapting it to the use of compressed air.

Gas Engine Runs Shafting.

The Producer Gas Company, of 11 Front street west, Toronto, had a very interesting exhibit on the north side of the south bay of the new Process Building. The exhibit consisted of a 35 b.h.p. Campbell gas engine (factory type) and a 35 h p. Campbell suction gas plant. Visitors were at once impressed with the solidity and strength of all the working parts of the engine and the great simplicity of the gas producing plant. The engine, although considerably the largest gas engine in operation at the exhibition, was simply bolted to the floor without any special foundation whatever and in spite of this somewhat severe handicap, ran quietly and with little vibration. Another feature of the engine is that the valves are not seated into the main castings but into special valve plugs. These plugs engage metal to metal with the liner casting and can be detached for examination or cleaning in less than one minute. The combustion chamber, too, is so shaped that the proportion of heat lost through walls by radiation is reduced to a minimum. The cylinder also is fitted with liner, which can be removed in a few minutes should it ever be necessary to rebore. Ignition is effected by high tension magnate machine, which renders batteries and spark coils unnecessary, both the speed of the engine and the timing of the explosion are under the control of the operator whilst the engine is running. The Campbell Co. also make a feature of supporting the cylinder for the full length of the stroke by prolonging the massive bed plate. This effectually prevents the working loose of the engine on its foundation, a fault frequent with engines having long overhanging cylinders. The greatest interest, however, centred on the suction gas plant. The Campbell Gas Engine Co. claim to have achieved maximum efficiency with maximum simplicity—a very desirable result because a suction gas plant has a double advantage when its economy with labor and attention is as great as its economy with fuel. The gas plant consists of a simple form of gas generator, vaporizer, separator and filter. It is entirely automatic in its action and requires no attention beyond the necessary charging with fuel and as only 300 lbs. of coal are used in a day of ten hours on full load and considerably less than this if the load is lighter, the labor of coal handling is insignificant. The exhibit is in charge of Mr. G. P. Wallington, of the Producer Gas Co., Toronto, and Mr. T. G. Doyle, the Campbell Gas Engine Co's Canadian engineer. There are eight Campbell gas engines in operation in Canada and six producer plants, all giving excellent satisfaction. The total horsepower in operation or on order for Canada amounts to about 1,000 brake horsepower.

Canadian National Exhibition—Exhibit of Labatt Mfg. Co., London, Ont.

Many More Exhibits.

There are many more interesting exhibits at the Exhibition, mention of which will be made in a subsequent issue.

THE CANADIAN NATIONAL EXHIBITION.

THE general prosperity of Canada at the present time is reflected in the Twenty-eighth National Exhibition held in Toronto, commencing August 27th. The growth of this exhibition has been in keeping with the growth of the country. This year further evidences of prosperity, expansion and development are evident. The new Process Building is a credit to the management of the Exhibition, and as a permanent structure for the purposes to which it is adapted it has probably never been surpassed. All lines of exhibits show a higher standard and an aim towards perfection that is laudable. That greater interest has been taken than heretofore is apparent from the greater number of manufacturers represented. Even with the enormously larger exhibiting capacity the space was at a premium, and in certain lines was not available.

The growing importance of the gas engine as a prime mover is the most striking feature in the manufacturing line. For the first time in the history of the Exhibition and, in fact, for the first time at any exhibition in Canada, gas producer plants running gas engines have been shown. Admitting this is proof of the slowness with which this country has taken up this phase of the prime mover question. The people of Great Britain and the Continent would probably smile to know that this is the case, but while they were busy developing the question of gas for power we were expanding along other lines, and are now ready to enjoy what benefit there may be by the researches made by them along this line. The three plants shown, two of which are in operation, give ample proof that they must be considered as a factor in the future. To most of the visitors they are a revelation, and those to whom they are not new are forced to admit that they must swing into a not unimportant place in the near future. Three years ago there was not a single gas producer plant in this country; now half a dozen firms are pushing these lines with vigor.

Another surprising feature to most people was the number of gasoline engines shown. Few people have been aware of the extent of development of this line in Canada during the last year or two. Had all the firms manufacturing gasoline engines in this country exhibited many times the space at present devoted to these would have been necessary.

For the first time in the history of the Exhibition machine tools in operation were shown. This is apparently only a start in the metal working line, and another year will probably see many exhibits of this class. Experts operating lathes and grinders were a new feature and correspondingly interesting. With the advent of a new Machinery Hall along the lines of modern construction such as has been incorporated in the new Process Building, and equipped with suitable cranes and transportation apparatus, a different interest would be taken by the machinery people in this country. It is noteworthy that of the machine tools exhibited only three manufacturers had exhibits, and of these two were from the United States. However, machine tools are a scarce article at the present moment, and few manufacturers are in a position to supply such for exhibition, being so far behind in orders that they cannot hope to catch up for many months.

As a strictly educational demonstration along industrial lines the exhibits in the Process Building are worthy of unstinted praise. The firms who have gone to the trouble to show the public how their particular lines are manufactured are deserving of every encouragement. May next year see many more added to the list. With a new Machinery Hall such features along a mechanical line would have a chance and the Canadian National Exhibition management would do nothing better than provide for such for the coming year.

USEFULNESS.

IN general a man's position in a community depends upon his usefulness to the community. The same is true in all walks of life. It is true in political life, although perhaps with some modification; it is true in social life, and it is particularly true in industrial life. To be useful to the highest degree a person or institution must have at heart and be in thorough sympathy with what it is desirous of accomplishing. Its incentive must be right and its motive the best. Failure along any line is very often not due to inability but to not realizing the field for usefulness in that line and making the most of it.

One of the greatest educational forces in the country, and with probably greatest scope for usefulness than other institutions, is the newspaper. They are of all sorts and conditions, all kinds and classes. The small

weekly plods along in its narrow field and the great daily spreads over many provinces. The class paper reaches its clientelle and the trade newspaper keeps its patrons alive to the conditions along their own line, from one end of the country to the other. In the latter class of paper there is a field for usefulness and more is probably being accomplished than in any other. To stimulate the growth of industry to keep alive the possibilities in manufacture, to inform the proprietor or general manager of a firm as to the best methods of buying or selling, methods of cost keeping, and the latest news that is taking place along his own line of development is performing useful service. To teach mechanical superintendents the latest in the technical world, to show the shop foreman and mechanic what is newest in machinery and how to best accomplish his work, and also features in fulfilling a destiny. When a man thinks he has accomplished his work when it is only half finished he can hardly expect to reap the highest reward for his services. When a newspaper goes only half way to reach the end towards which it should attain it is but half accomplishing a useful service. Trade newspapers are silent salesmen who get an audience with every issue. Their influence is in direct proportion to the influence of their audience. A newspaper going to double the field of another is twice as useful.

Most of our advertisers realize that the field of Canadian Machinery is a treble one. It goes to the man who owns and manages, it goes to the man who superintends and directs, and to the man who operates. In this way its sphere of usefulness is trebled. An advertiser has the possibility of the influence from three directions, all of which may be material in placing an order. This fact is significant. It is worth considering. It is, in fact, the fundamental consideration in connection with placing advertising. The advertiser reaps the benefit of influencing all possible interested in the placing of an order or the buying of goods, and means everything in the question of publicity from advertising.

ARE THE BRITISH WAKING UP?

DURING the past few years, when the United States manufacturer has established some dozens of branch manufacturing plants in Canada, the British industrial community has been an apparently uninterested spectator. Whether caring not or knowing not matters little, as the cold, hard fact stares them in the face that an opportunity has been missed that should have been grasped. They may make a move now to overcome an obvious mistake, but this lethargy cannot be overtaken nor the past recalled.

The fact that the announcement recently of a large Coventry firm's intention to establish branch works in this country came as a surprise to the manufacturing public here shows that the unexpected had happened. Whether it indicates a general appreciation of the possibilities in Canada on the part of British manufacturers, or is but an isolated case, is not known. It is, however, a recognition on the part of one wideawake concern, whose enterprise enables it to reach out across the ocean, that this country offers a field for manufacture.

The advertising we have received lately from various sources must some day start the ball rolling. When a general awakening has taken place, which must come, we predict a wholesale scurrying for sites and locations. In the meantime they seem satisfied to wait, and while waiting British manufacturers are making the same mistake as during the past five years in not looking ahead a little and exploiting the breadth and scope for various manufacturing industries throughout the Dominion.

LARGE PURCHASES FROM U.S.

WHILE the tariff preference with Great Britain arrested the decline of British trade with the Dominion, it did not prevent the enormous growth of Canada's trade with the United States. A comparison of the relative amount in iron and steel products show the enormously larger trade done in these lines with the United States as compared with Great Britain. A list of some of the lines shows for pig iron from Great Britain $247,406, and from United States $610,315. Bar iron and steel $289,961 and $565,870. Bridge and structural iron $2,119 and $717,165. Rolled edge bridge plates $4,199 and $402,576. Plates and sheets $189,417 and $712,448. Angles, beams, channels and like material $240,710 and $1,244,245. Hoops, bands, scroll and strips, $51,247 and $127,240. Railway fish and tie plates $18,604 and $151,828. Nails $4,615 and $160,708. Tubing $137,879 and $978,453. Wire $166,664 and $622,634. Nuts and bolts $7,528 and $116,084. Tools $47,099 and $772,470. Machinery $293,384 and $4,023,425. Gasoline engines $623 and $193,652. Pumps $3,706 and $199,016. Butts and hinges $1,341 and $59,016. Saws $5,473 and $168,783. Files and rasps $8,272 and $63,788.

The first figures in each case are those representing the amount from Great Britain and the latter from the United States.

Take the case of machinery alone. Over sixteen times as much is bought from the United States as from Great Britain, and about the same relative proportion of tools. Gasoline engines show even more marked difference, the amount from Great Britain being practically nil. In every line mentioned the difference is enormous, and enough to make the British open their eyes and wonder what it all means. One of the most prominent reasons is that United States manufacturers have an appreciation of Canadian business, are keenly alive to it and make special endeavors to secure it, while with our friends across the water, enjoying particularly favorable tariff privileges, this has not been true. The nearness of the United States is very much in favor of U. S. goods, and this probably offsets the British preference to some extent. Otherwise the difference seems to lie with the keenness for business and the enterprise in business circles between the two competing countries for Canadian trade.

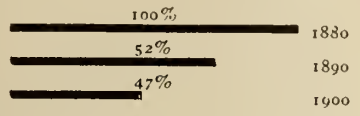
EXPORTS AND IMPORTS INCREASE

THE remarkable growth and prosperity of Canada is shown by the trade returns for the year ending June 30, 1906. The reports show an expansion both in the exports and the imports; and the increase in trade is not confined to any one branch, but is general. The total foreign trade for the year amounts to $552,000,000, an increase over last year of nearly $82,000,000, representing an increase of over 17 per cent. Of this foreign trade the imports entered for home consumption amounted to $290,342,408, an increase of over $28,000,000 over last year, representing an increase of over 10 per cent.; and the exports of domestic products amounted to $245,483,956, which is over $44,000,000 in excess of the year 1905, showing an increase of over 21 per cent. The exports of foreign produce show an increase of $9,000,000. The exports of domestic manufactures amounted to $24,561,112, an increase of $3,369,779 over 1905.

Profits and Needs of Machinery Manufacturers

By Myron Edward Evans, C.E., in Selling Magazine

MANUFACTURING operations are being carried on against a gradually contracting profit as judged by the returns per dollar of investment. Statistics giving the tendency in the matter of earnings of manufacturing concerns are difficult to secure. The United



EARNINGS ON MANUFACTURING CAPITAL AS COMPARED WITH EARNINGS IN 1880.

States Census Bureau compile statistics of the value of products, and report a number of items of cost and expense of manufacture, but specifically warn the reader that the difference between these figures should not be considered as the net profit of manufacturing operations in the United States. It is believed, however, that the figures so compiled may indicate, relatively, the profit secured in the manufacturing industries, and will be found of interest as disclosing the tendency to reduced margins, which has been experienced within recent years. Unfortunately the statistics for 1905 are not available to the writer, but the accompanying diagram will show the relative earnings in proportion to invested capital for the years 1880, 1890 and 1900.

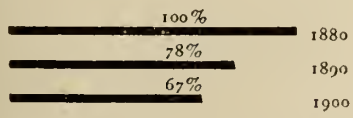
It will be observed that the profits have been apparently cut in two in the twenty years under consideration.

Less Business Per Dollar of Investment.

The decrease is partly accounted for by the decreased volume of business, which the manufacturer is able to carry with a given investment in capital.

Another cause is found in the decreased margin of profit on sales.

To offset this tendency, manufacturers have increased their investment, increased the volume of their business, and



SALES IN PROPORTION TO INVESTMENT, AS COMPARED WITH SALES IN 1880.

worked out operating economies for the purpose of maintaining fair uniformity in the results of their operations.

Increased Volume of Business.

Individual concerns show increased volume of business as follows:

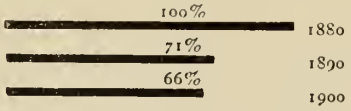
By this means and related efforts, they have maintained a practically uniform result, as will be seen in the diagram showing manufacturing results per concern.

The Iron and Steel Industry.

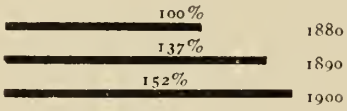
The great iron and steel industry, which includes the principal machinery manufacturers, when studied, shows a shrinkage in investment returns between 1880 and 1890, followed by a recovery in 1900. The volume of business for each concern, and profits per concern, both increased to a marked extent in the decade 1890 to 1900.

Machinery Manufacturer Secures Average Return on Investment.

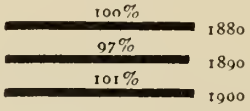
The machinery manufacturer secures about the average return upon his investment, as compared with the various manufacturing industries of the country. The following diagram presents the fourteen groups of industries, arranged in the



MARGIN ON SALES IN PROPORTION TO MARGIN IN 1880.



SALES PER CONCERN AS COMPARED WITH SALES IN 1880.



PROFITS PER CONCERN AS COMPARED WITH PROFITS IN 1880.

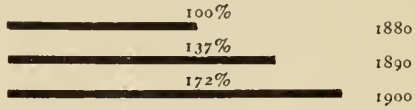
order of their profit in proportion to capital invested, as reported for 1900.

It will be observed that the iron and steel industry, embracing the principal manufacturers of machinery, stands at the average of the fourteen groups.

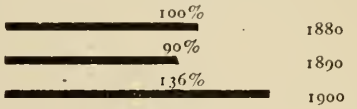
Becoming more specific, we find that certain of the machinery manufacturing lines, when compared with the average of the industries of the country, range as shown in the following table:

A Contracting Margin of Profit in Machinery.

The machinery manufacturer has worked against a contracting margin of profit and an increasing sluggishness of his capital, but secures about the average return on his investment. In considering his needs we are forced to the conclusion that they must be within the



SALES PER CONCERN IN THE IRON AND STEEL INDUSTRY AS COMPARED WITH SALES IN 1880.



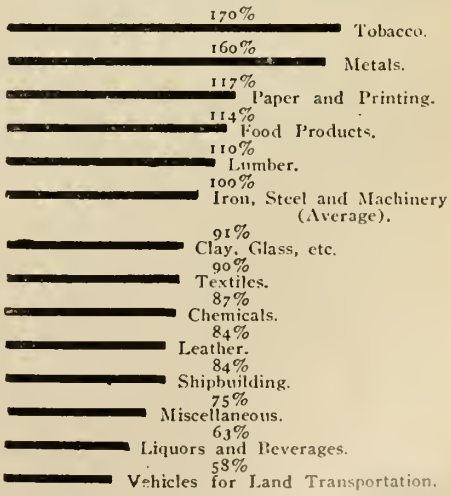
EARNINGS PER CONCERN IN THE IRON AND STEEL INDUSTRY AS COMPARED WITH EARNINGS IN 1880.

of output per machine or labor hour. These efforts contribute to economy in decreased cost of production; they also contribute in reducing the plant charge against machines made, which enables an increase in the activity of the capital scope of the terms "activity" and "economy."

Probably no industry has had brought to bear upon its problems more knowledge, skill or ingenuity than has that of the manufacture of machinery, in increasing its production through increase as judged by the volume of business per dollar of total investment. Production engineers and certified public accountants have developed a science of production and a science of cost finding, which have enabled the manufacturer to reduce his production costs to a remarkably low point.

Activity of Capital Dependent Upon Sales Department.

Improved machinery, processes, organizations and methods have accomplished



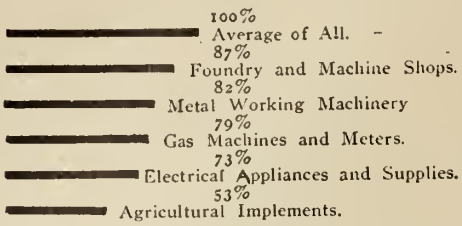
EARNINGS ON CAPITAL IN THE PRINCIPAL INDUSTRIES AS COMPARED WITH THE AVERAGE EARNING.

a marked betterment in results, but their operation has been largely up to the

point of what might be called f.o.b. factory. Beyond this point comes the department of the business having to do with the marketing of the machinery. The sales department is not yet a scientific institution. Upon its aggressiveness depends the activity of the concern's capital, as judged by the volume of business. Upon this department largely rests the grasp of margin premiums as distinguished from the bare margins, which the unscientific sales department is liable to be reduced to.

Full margins on sales, large volume of business, true economics in salesmanship, embracing the economies which contribute to profits and the expenses which do the same, these are a few of the problems facing the machinery manufacturer.

Thus far improvements have been quite



EARNINGS ON CAPITAL AMONG A FEW LINES OF MACHINERY MANUFACTURERS, COMPARED WITH THE AVERAGE OF ALL MANUFACTURING LINES.

large in the factory. Here the manufacturer is governed by more or less exact laws. So exact are they that competing concerns occupy closely competitive positions as regards cost f.o.b. factory. When it comes to the sales department, about the only law is that of the personal equation.

Ways and means of improvement are most difficult to understand, and require great business statesmanship to grasp and work out, but here is also the greatest opportunity. Margins are smaller when the way is clear, but premiums are possible to the concern whose sales department leads in true economic and scientific development. The next step in the line of improved manufacturing results will be found in the development of a science of selling.

Advertising of Manufacturers and Dealers

By W. HULL WESTERN; Manufacturers Advertising Bureau.

To one in business there is a wide difference in the status of advertising as it is regarded by the general advertiser and the seller of machinery, mechanical apphances and the like. With few exceptions the latter, using almost exclusively what are termed the technical and trade journals, doesn't take the matter of advertising very seriously. And this may explain much. There is a vague indefinite feeling that there is good in it and that it is the proper thing to spend something during the year to keep one's name up. And so the thing is done, but without any great expectations, or the expenditure of more than the minimum enthusiasm.

If, when the twelve months have passed, there are any convictions arising from the experience, it is the belief, more or less openly expressed, that advertising on the whole is a nuisance and altogether the most unsatisfactory thing the advertiser spends his money for.

And mostly he's right.

There is no going back of the fact that what one gets out of advertising is largely determined by what is put into it, and this in turn depends upon the degree of interest and enthusiasm which the work engenders.

It would seem that there is mighty little but money put into the advertising end of the business by the average machinery dealer to-day, and that is mostly just put in.

There are reasons, of course, why this is so.

Triple expansion engines, coal handling machinery and the like are not universal necessaries, to be sold by the gross or carload; neither do they suggest great possibilities as the basis for a mail order business. The trade from advertising products of this character must come most frequently in devious indirect ways (as it usually does) and its propagation calls for a full allowance of faith.

Clearly the situation does not make for the highest degree of enthusiasm.

Seldom, too, in manufacturing concerns is there anyone of the right calibre who really wants to attend to the matter; can't take the time from other duties; thankless job, and all that. And so the work is tossed from one desk to another, until it has gone the rounds of the office and become the most bedraggled and neglected part of the business.

Someone will some day take the time to give this important aid to the selling organization the attention it deserves, and so realize what a big and vital matter advertising really is and how much it can accomplish under the right conditions. For the present, few, even among those who have some real faith in its value, are willing to admit offhand that advertising can do much for one's own business as it has done for that of his neighbor in trade. And this because of the belief that his is a "peculiar" business and therefore one to which the usual usages and methods of procedure may not properly apply.

And what if it is granted instanter that this is so?

It simply proves what men of experience well know, namely, that every business must be considered of and by itself and the advertising adapted to meet the conditions which obtain in each individual case.

If users of advertising space in the technical and trade papers knew the good that would result from a systematic and dutiful attention to their advertising, instead of the happy-go-lucky way in which this end of their business is usually conducted, they would no longer miss the fine possibilities it affords.

Advertising is no longer all theory; much has been proved.

It has developed from a business man's rattle into a mighty serious business, and indeed comes very near to being a science.

Many extremely bright and ambitious men have been drawn to it, and have given it of the best that is in them. The result has been the uncovering of possibilities that cannot be over-looked by the serious, earnest merchant or manufacturer who would not only progress but survive.

In order, however, to go at the matter properly, one must recognize at the start that the advertising will not safely run itself; neither can its management profitably be intrusted to the tender mercies of a junior clerk or office boy. Also that it does not pay to make contracts for the fun of seeing one's name in bold type, or because the "solicitor" is persistent and a "good fellow." That really isn't good business.

More than all must come the conviction that it is necessary to give this department of a business the same thought, labor and financial support as is extended to others if the results are to be correspondingly satisfactory.

The matter of advertising naturally comes within the scope of the sales department and should be considered in

conjunction with it. Working in accord with the sales manager, the men on the road and the branch offices, it can accomplish much to the advantage of all.

Just as soon as the matter of advertising is talked about there is a noticeable quickening in the business life of a concern as a whole; when it is actually entered upon, the benefit is decidedly apparent. Every one appreciates the fact that something is being done by "those higher up" to push things, and each instinctively gets to work with a surer grip in the effort to make good."

The branch offices and men on the road gradually feel the movement of the vital forces in motion at the other end of the line, and strive in turn for a better showing partly from a natural pride in pulling their share, and partly that they, too, may reap the greater benefit from the help thus given, while it is to be had.

The result is a vim and "go" that breed dollars.

There is nothing else quite as sure for good in a case of "dry rot," threatened or arrived, as advertising.

Neither is there anything more reliable as a general business tonic.

The purpose of advertising, briefly, is to create new business and hold that which has already been created. And if it is of the right sort, it will do this. Advertising fathers opportunity for both buyer and seller. It brings one's product to the direct notice of the trade or the consumer.

Through advertising it is possible to reach many out-of-the-way markets of the world, where the man with the trunks and the grip-sack could not seek orders profitably. It will, moreover, pave the way in splendid shape for these hard-working pioneers of business as they wind their way through the great commercial centres, and make the catalogue, or other business literature which naturally follows, both welcome and of more than passing interest.

Beyond all this, an original, forceful line of advertising is proof convincing to the world at large that the concern back of it is a stirring and progressive one, that it is doing things in a big, broad-gauge, twentieth century way; and you and I and everyone else like to do business with just such people.

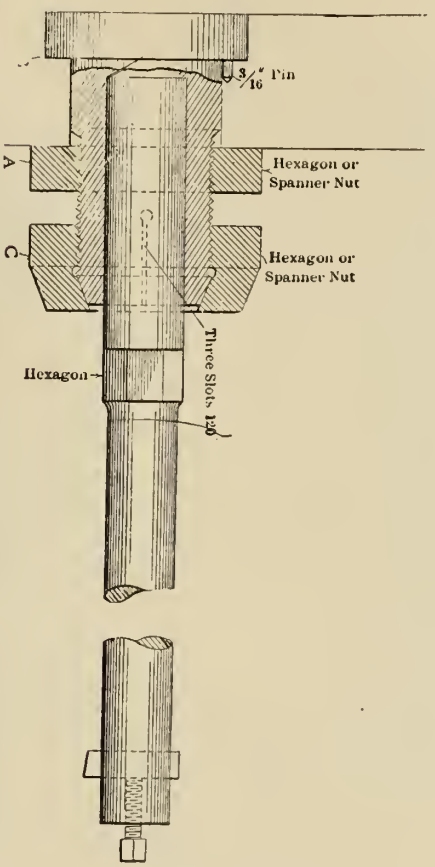
Seeing is still believing, mostly, and one feels that such folks are dependable.

Business conditions are changing, and where, as is so largely the case to-day, the buyer and seller rarely have a chance to meet face to face, there is no better or surer way for the seller to get known than by being fittingly and persistently represented in those publications which cover the various industries it is desired to get before and cultivate.

The acquaintance and reputation which can be acquired in this manner will often decide the direction in which orders are placed, and, of a certainty, cannot be gained as economically or expediously by any other means.

The value of advertising, also, for securing representatives in various and remote sections of the country should not be overlooked.

It very often occurs that business connections are made with individuals and concerns of reputation and standing who are led to seek an agency because of the vigorous advertising that is done by the enterprising manufacturer; which also makes his goods easier to sell than those less well known, and thus profitable to handle.



Key Seating Tool for Shaper.

The trade press as a whole is steadily making for a better average, and there is scarcely a profession, industry or field of commercial activity that has not its publications of worth devoted to its special interests.

One may, therefore pick and choose his battle-ground fairly, and plan the campaign for more trade to suit his inclination and his purse. It is thus made practicable to "try out" new or promising fields, and so size up the possibilities afforded before going into an expenditure of time and money which might otherwise attain large proportions and prove unprofitable after all.

Of necessity, to reap the maximum results from advertising, especially machinery advertising, the matter must be taken in hand in a serious, systematic and business-like way. It is all one man can do and do well, and to try to crowd the work in along with other duties is to invite failure at the start. The thing simply cannot be handled in such a way and be made to pay.

Advertising to-day is a big and growing proposition. It costs a good deal in time and money and needs a brainy man with tact, and a wide experience back of all to make it pan out satisfactorily.

There should also be judgment at command that is sound, a capacity for investigation and comparison of values, which comes only to a mind trained to the work, with the ability to take favoring opportunity as it may develop, and make the most of it in an advertising way.

All of which may be secured if the desire is both keen and sincere.

KEYSEATING TOOL FOR SHAPER.

By Herman Jonson, in American Machinist.

THE sketch herewith needs little explanation. The tool is used in the shaper or planer for keyseating pulleys or gears. It is made to fit the clapper block of the shaper and the only change or work on the machine is the drilling of one 3-16 hole for the pin shown. It is sometimes necessary to have a washer under the nut (A), where the head is roughened. The chuck (B) is made of machinery steel, case hardened, and the nuts and bar of tool steel. The hexagon on the bar serves two purposes; one for setting the bar, and second, where it is desired to plane a semi-circle it may be turned with a wrench. To plane a semi-circle the nut (C) is made just tight enough to hold the bar steady while it is rotated. It often happens in a shop that a piece larger than can be bored on the lathe can be planed in this way.

NEW GAS ENGINE COMPANY.

The Producer Gas Co., with Mr. G. P. Wallington, mechanical and civil engineer, as manager, has started business at 11 Front street east, Toronto. This firm have secured the Ontario agency for the Campbell gas engine and producer through Wayland, Williams & Dadson, of Montreal, the Canadian representative of the Campbell Gas Engine Co., of Halifax, Eng. The Producer Gas Co. are making a specialty of gas engines and producers of all descriptions.

Foundry Practice.

MODERN IDEAS FOR THE TRADE.

RECENT METHODS OF MACHINE MOLDING.*

By E. W. Mumford, Philadelphia, Pa.

I REALIZE that I have said and written so much about molding machines that anything more from the same source would be unwelcome, as lacking in novelty, were it not that, like any explorer of terrae incognitae, I have but to describe what I have seen to be credited even with originality.

It is because I feel that I can tell you of some new things and some new combinations of old things, which I think are to make the year 1906 one memorable in the history of machine molding that I venture to address you again.

I may as well mention the fields of development, taking up the detail in those fields as I go. You will at once say that the fields are well known.

Broadly, this is true, for they are as follows:—

1. Rock Over Molding,
2. Jolt Ramming,
3. Match Plate Molding,
4. Multiple Molding.

So far as I know, Rock Over and Multiple Molding by machines are ten years old. Jolt Ramming is over twenty years old, and Match Plates are the oldest thing in machine molding.

From the hinged flask to the first Rock Over Machine was but a step. Put the pattern on a Match Plate and hinge it from a point outside the flask area, with a counter-balance spring or weight to help handle the weight of plate and pattern, and a simple spring clamp to hold a bottom board on, and you have the earliest good seller in the Rock Over Machines. Its shortcomings are its radial pattern draft, which causes the pattern to bite off sand walls near the hinge especially, and the considerable error introduced by landing the mold on a more or less uneven bottom board. Mistakes have been made by designers putting brains and money into accurate pattern draft mechanism on machines, and afterwards vitiating all their designs by obliging their gear to draw a pattern from a mold which has tilted over on an uneven bed. You may know without trying that any machine that places a mold from which it is to draw a pattern on its back on a bottom board of any description and then draws the pattern regardless of the new plane of the mold joint will not be satisfactory on work involving any appreciable pattern drawing accuracy; and, even on the simplest work, if an absolutely clean lift is wanted, this inherent error will prevent it.

Before going further, I may as well state that much that I mention in this paper either is already or will be patented, the foundry trade should be grateful to our beneficent Patent Law that allows public use and advertisement of a new idea without sacrifice of a patentee's rights, for, by this condition, the trade get the use of the new machine just so much the sooner. It may be regrettable that enterprising foreign foster-mothers proudly adopt as their own promising American off-spring; but, after all, these infant wanderers seldom thrive away from home and the main regret is that they should be so abused and maltreated as to get an undeserved reputation for inanition. Of course, it is well understood by members of this association that it is best to avoid appropriating other people's ideas which are in process of development for patents, and I will, therefore, not hesitate to tell you some of the good things I know.

A decided improvement in Rock Over Machines has been introduced by giving the hinge of the Rocking pattern support a rectilinear guide intended to be normal to the mold joint in its line of draft. This has been a most valuable innovation, but at present has in it the fundamental error I have referred to, of trying to get a fair lift from a mold lying on a bottom board, with a fixed pattern draft.

There are several easy ways of avoiding this difficulty, and one of these is already in use. I refer to taking the datum for the pattern draft from the joint of the flask. The half flask lies on its back on its bottom board, and the pattern is drawn by guides resting on the joint edges of the flask. This is the correct method and deserving of success.

Jolt Ramming.

Jolt Ramming is 20 years old in this country. If you consider merely the bumping of a mold to ram or partly ram it Jolt Ramming is as ancient as molding, for all bench molders have had occasion always to pick up a flask and bump it upon the bench to settle sand in the pockets. But, practically 20 years ago, S. Jarvis Adams had power Jolt Ramming machines running in Pittsburg on small deep flasks.

So it is not, in itself, a novelty, though some of the early patents upon it having now lapsed, its public use is only recently being advertised.

The canons of success in Jolt Ramming are:

A dead drop,
A firm, solid machine,
Centre of impact under centre of gravity of falling mass,
Impact always central.

Until recently, Jolt Ramming machines which draw patterns as well as ram molds, have combined both functions in integral mechanisms and have been capable of ramming in only one way. Now, machines may be had which separate ramming and pattern drawing elements may, if desired, be separately and simultaneously used, and, as a consequence, a variety of pattern drawing elements—or what are commonly called "Hand Ramming Machines"— may be used upon a single Jolt Ramming element.

Most of the work which it pays to Jolt Ram is so deep that, to draw patterns, stripping plates are required. To change stripping plate patterns on a machine requires considerable time. It is, therefore, often convenient to keep a set of stripping plate patterns which are frequently used, permanently fixed upon a pattern drawing machine. Moreover, there is no good reason for keeping an expensive Jolt Ramming machine idle while men are changing patterns on a pattern drawing machine, which may just as well be separate from it. Furthermore, a man may purchase a single Jolt Ramming machine, and add to it a variety of sizes of pattern drawing machines, and even use several of them at the same time on a Jolt Ramming machine of sufficient capacity.

Ordinarily speaking, the cylinder of a pneumatic Jolt Ramming machine is only large enough to raise promptly the weight imposed upon it. There is, however, no reason why this cylinder should

*Read at American Foundrymen's Convention at Cleveland.

not also be large enough to press a mold and be subject to the control of an automatic valve for Jolt Ramming and, at the next operation, to an ordinary throttle valve for press-ramming.

To illustrate, take a grate bar. The pattern is all in the drag, and is of such a nature that Jolt Ramming is best, but the cope is "flat back," and must be rammed upon the drag mold and pattern, sand to sand.

This is something Jolt Ramming cannot to. The pattern in the drag will settle down in the sand away from the joint, so press-ramming is necessary. A machine is now built for this use.

Match Plate Molding.

I know you will say that this fell so long ago from the tree that the chestnuts cannot even be found in the burr! But don't forget that many a chestnut has grown a new tree.

Match plates date from the good old days when molders actually did their own thinking, and studied out ways to save their employer's time. Theirs is an honored name, yet so many troubles have been laid at the door of match plates either ill-adapted for, or misused in their work, that many a man quits listening when you say match plates to him and begins to do the talking himself.

Probably the first successful use of vibrators was in connection with single-sided match plates, and there have been many applications of the match plate since then to machine molding.

The making of match plates with patterns cast in their surfaces by a process which constitutes the plate a fin of ¼-inch or more around the casting of the pattern is very old, though not even yet known to all foundrymen. In forming the edges of such a plate, any desired shape may be given to the casting. For instance, about six years ago aluminum match plates were cast with rabbetted edges to fit frames surrounding them, which carried the vibrators and flask pins, and with that, now, there is little, if any, excuse for continuing the use of patterns feebly attached to the gates which run the castings.

This leads me to comment upon the fact that the match plate is deservedly rapidly displacing gated patterns in these days of speed in machine molding, for the gated pattern requires the sand match or odd side and separate ramming of cope and drag, which the match plate does away with.

Given a gate or spray of master patterns, and an aluminum match plate with edges fitted to go in a vibrator frame, may be prepared now in an incredibly short time by a new process which I am not permitted as yet to fully describe.

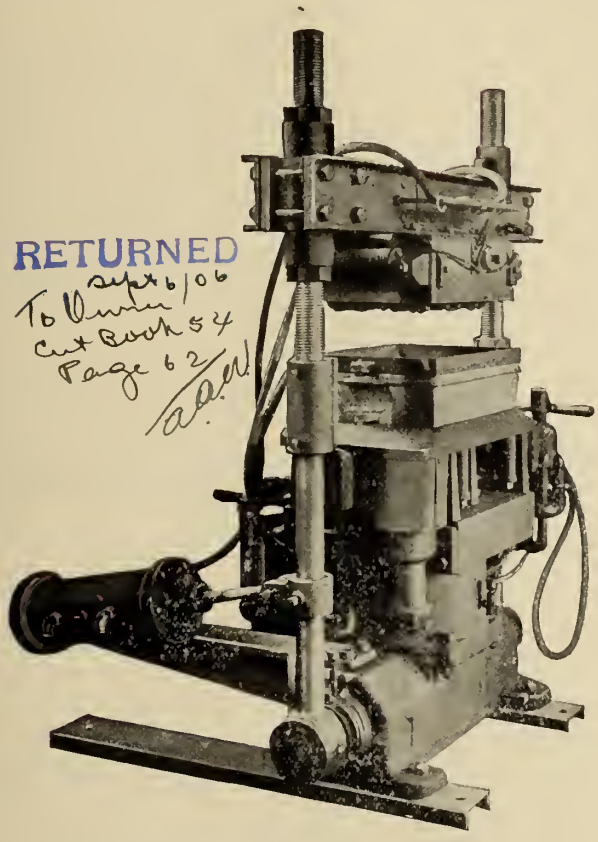
While speaking of match plates, if you will allow me I will mention an arrangement which is not yet completed and working, for the simple reason of lack of time, but the working of which is so simple, though, I believe, so novel, that I think you will pardon my speaking prophetically of its success.

It is simply a hinged match plate in a hinged flask. Hinged flasks are no novelty, and match plates would undoubtedly long ago have been used in hinged flasks, except for the disposition of the thickness of plate in closing, and the freeing of the hinge so as to get the match plate away. We give the flasks a double pin hinge and put the hinge of the match plate in one of them, so that the cope hinges on the plate until the pattern is drawn and then transfers its weight to its second hinge pin to free the plate. The plate is then hinged out of the drag and taken away, when its hinges are so arranged that the cope closes in perfect registration on the drag.

This method of molding avoids all handling of loaded flasks and reduces the "machine" to nothing but a match plate.

As a hinged match plate, however, it is limited to such patterns as will hinge out of both cope and drag, and is not for deep work.

If I presented no development of multiple molding beyond what has been known to the trade for some ten years,



RETURNED
SEP 6 - 1906

Fig. 2.—Showing Minimum Space Occupied.

there would be little excuse for saying anything about it, but almost as much has been done in the last five years as was done in the first five of the approximately ten years of multiple molding.

The first multiple molds were just ordinary two part molds, piled one on another, with a sprue hole cut through the drag part into the cope part of the mold below.

Next came the thought of utilizing the idle joint between a drag part and a cope part.

It at once became evident that, in order to make this kind of multiple mold, it was necessary to ram both top and bottom faces of the multiple element simultaneously. This meant that the drag patterns should be rammed down into a block of sand while the cope patterns were being rammed up into it. The impracticability of pressing a pattern down into a struck surface of sand had, long years before, been shown in the operation of a machine in Scotland in which a double-faced match plate was swung in edgewise between cope and drag flasks, the drag flask already filled with sand, the cope flask filled with sand dropped upon the pattern. In this machine, just as in multiple molding, until recently, the greater depth of the pattern had to be in the cope, and for the same reason—the common difficulty of getting sand up around the pattern, against the universal downward tendency of all things.

In 1902 Mr. P. D. Beckwith, at Dowagiac, Michigan, made a great improvement in multiple molding by providing for filling the drag pattern while inverted and then holding the sand up against the drag pattern while turning it back upon the sand already filling the flask upon the cope pattern.

Although doing this accomplished for the first time the ramming of deep drag patterns in multiple, yet the time occupied in handling the drag patterns separately was sufficient to very much reduce the otherwise rapid machine molding. There remained, however, the large saving in floor space and in sand and flasks inherent in multiple molding.

It would surprise the many who carp at multiple molding as a fad that has run its course to visit Dowagiac and see the kind of work Mr. Beckwith is making in this way.

And now comes Rathbone, with his new principle of neutralizing gravitation by causing the unrammed sand in the flask with excess sand enough in the removable sand frame over the flask to allow for compression to move up against and around the drag patterns fixed to the ramming block of the machine with velocity equal to what it would have had if it had fallen in upon them.

By this means Rathbone sets the loose sand up around his pattern before ramming in an instant of time and just as effectively as though accomplished, as of old, upon an inverted pattern. In other words, he gets the drag mold practically instantaneously without the heretofore inevitable rolling over either before or after ramming.

If you will consider carefully what this means, you will see that a complete mold is formed by as simple and quick a process as is employed in other machine processes for forming the drag half alone.

As yet, the Rathbone process has been operated without time savers such as hopper-fed sand and automatically struck sand faces. But, notwithstanding this, sixty 14x16-inch or 13x18x4½-inch molds an hour are easily made by one man who shovels his sand from the heap and stacks his finished molds eight or nine high.

As a rule, the flasks used for multiple molding must be about 15 per cent. deeper than the half flasks used in ordinary two part molding. This is because each flask has half of the cope and half of the drag patterns in it, and must have sand enough in its depth to allow for this.

Work of about 2-inch total depth is usually piled nine molds high in flasks 4½ inches deep. That is ten flasks—nine molds—in a pile.

The saving in sand and flasks accomplished under these circumstances is :

$$.85\left(\frac{18-10}{18}\right)=37 \text{ per cent.}$$

The saving in floor space is :

$$\frac{9-1}{9}=88 \text{ per cent.}$$

Most foundrymen think that the castings at the bottom of a pile in multiple molding must strain, owing to the ferrostatic head of, say, 45 inches.

Two things should be considered before assuming this :

First.—That never were molds so perfectly clamped and weighted as those at the bottom of a stack of nine molds. If sand rammed as a liquid, and the same ramming pressure laterally as vertically might be assumed, the liquid iron would find walls of sand all about it set up at a pressure of at least 40 lbs. per square inch and held against displacement as never before. This iron, standing in a liquid column 15 inches high would exert a pressure less than 12 lbs. per square inch, so that, unless the walls of the molds yielded to such a pressure, and they would not, there could, even then, be no straining. But the second consideration is that the usual guarantee against strained castings is had by so reducing the section of the gate which leaves the metal to the mold as to insure its having set before the column of metal in the sprue has risen to a height sufficient to put an excessive head on the mold.

While there are many more new methods of machine molding which I might mention, I believe that in the main the most interesting have been referred to. The perennial search for permanent molds is being made and it is barely possible that, for light work, a permanent mold of refractory material that will allow a casting to shrink in it without pulling apart or that will follow the vagaries of cast iron in its process of crystallization may be discovered, but the problem is not an easy one, and I am inclined to think that for a long time to come green sand and a strong back or a good machine will produce most of our smaller classes of castings in large quantity.

INCREASING THEIR POWER RESOURCES.

The Montreal Light, Heat & Power Co., Montreal, are about to carry out a hydro-electric power development at Soulanges, on the St. Lawrence River. The contract for the installation of the hydraulic and electric machinery has been let to Allis-Chalmers-Bullock, Limited, Montreal. There will be three large turbines each with a capacity of 5,350 b.h.p. on the shaft under a head of 50 feet. To these turbines three 3,750 k.w. generators will be direct connected. There also will be two smaller turbines, each to develop 800 h.p., to operate the exciters. Provision is being made for the installation of a fourth unit of 5,350 b.h.p., when it shall be required.

A unique feature about the plant is that the draft tubes for the large turbines will be concrete construction, this being the first construction of this kind in Canada. The object in making the draft tubes of concrete is to decrease the coefficient of friction at the bends in the tubes.

Heretofore it has been the custom to get the castings for the water turbines for large installations such as this one from the continent and, therefore, the fact that Allis-Chalmers-Bullock are able to undertake the contract reflects considerable credit on Canadian industry in general, and Allis-Chalmers-Bullock in particular.

External temperature changes have no appreciable effect upon the operation of a mechanical draft plant which above all else is independent of climatic changes and conditions. The fan is a most important factor in smoke prevention, and in connection with the closed-fire room system the resulting ventilation is of vital importance.

The Molding Cutter

By T. C. Robertson, Galt.

THE subject of molding cutters, especially that branch which deals with the laying off of cutting edges, is one which should be of interest to molder men, and one which, owing to the geometry involved, is not always understood by the operators of these machines. After a little investigation any one can see that a knife the same shape as the molding would not make it accurately owing to being on an angle to the bed of the machine when it does the cutting; or in other words, if a knife is ground so that every part of the edge will touch the mold at the same time it will not reproduce the required shape although it may approach nearly to it.

As the head containing the knife revolves, the largest part of the knife strikes first, and then leaves the finishing line before the shorter portion comes into action, and in this way complicating the problem so that accurate work cannot be done without a great deal of cutting and trying.

Before illustrating and explaining a system of laying out molder knives let it be understood that the operator should choose a cutting line, and by a cutting line is meant the projection of straight knives with which the surfacing is done. The projection is usually about $\frac{1}{4}$-inch from the body of the cutter head. The method of laying out proportional drawings shown in the accompanying diagram is correct in theory, and when the operator has no other appliances except pencil and compass he can get it sufficiently accurate, especially if he has a good eye for form. It must be borne in mind in using this system that one scale will not do for heads of different diameter.

We will first notice the difference between the perpendicular or face of the molder and the slant of the edge of the knife, the first of which we have, the second we must obtain. From the cutting line (A) directly beneath the cutter head a standard scale is carried down say $1\frac{3}{4}$ in. with divisions of $\frac{1}{8}$ in. From the divisions on this scale are described arcs intersecting the line continued from the knife. From these intersecting lines are projections at right angle to the knife forming a new and different scale shown at (B). It will be noted in this scale that the allowance for the knife projection becomes less as the knife is extended farther from the head. This is the reason that the straight-edged bevel cutter will not produce a flat surface, but must be rounded in proportion to the decrease in projection allowed.

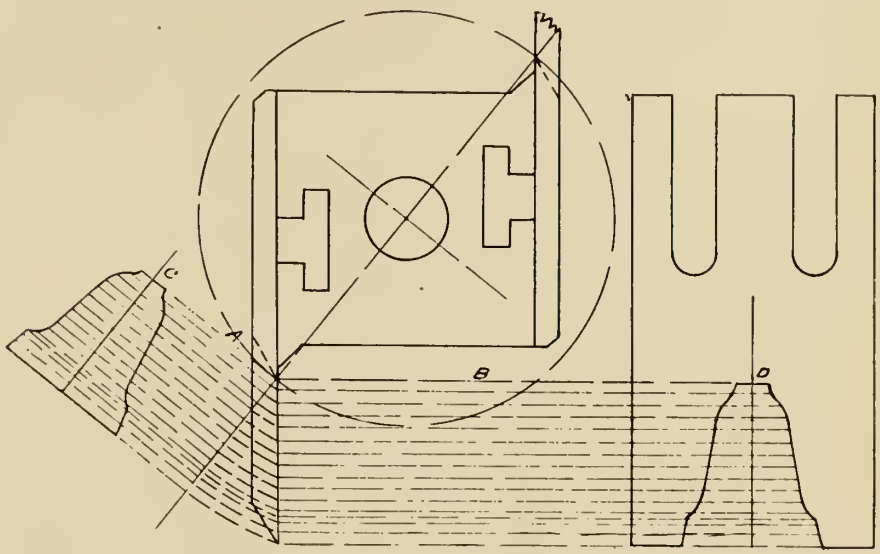
Referring again to diagram, the molding for which the knife is to be made is shown at (C), into which the lines from the standard scale are projected. A centre line is drawn through the molding corresponding to the centre line through the knife at (D). Measurements are now taken from this line on the various projected lines and transferred to the knife pattern at (D) on the new scale. At the intersections of these lines with the projected lines on the new scale is drawn the outline of the knife to make the required molding. It must be noted here that unless the scale be drawn with great accuracy the true curve for the knife will not be obtained.

All that is now necessary is to use a piece of sheet brass in laying out the curves obtained and use it as a template for the knives. A careful study of the diagram will show that it will not do for heads of different diameters, the variation being about 1-32-in. to every inch of projection.

The next step is to obtain proper blanks for the knives, and in selecting these we should be governed by the knives already in stock as we must arrange our combination so that we will have room to bolt several members upon the cutter head. Patterns should be so divided as to avoid inside corners wherever possible, as they must be sharpened with a file and so cannot be tempered as hard as is necessary to do good work. Knives for deep cuts should be as long as possible, for if the slots extend too near the edge, it will be hard to prevent springing, especially if the knife be a narrow one. When the blank is wider than the pattern to be struck it is usually better to have the surplus metal on the long side as it adds strength and gives less grinding.

In roughing out knives care should be taken to avoid encroaching upon finished lines. The surplus steel should be ground off on a bevel and straight across the edge to show the true outline. After the knife has been properly shaped it should be ground sharp without turning the edge, and the same precaution should be taken in merely sharpening them.

It is almost unnecessary to deal with the matter of tempering knives in this article. Experience is the only and best teacher. Considerable care should be taken to obtain an even temper, which is rendered difficult owing to the variety of shapes involved in different moldings.



Projections of Moulding Cutter.

NEW MANUFACTURERS' AGENT.

One of the latest firms of manufacturers' agents to open offices in Montreal, is that of Baxter, Patterson & Co., who are representing some of the best known Old Country manufacturers in machinery and hardware lines. J. L. Baxter, the senior member of the firm, has been for some time connected with L. N. Beard, manufacturers' agent, Montreal, and is thoroughly acquainted with the trade, both in Canada and the Mother Country. Wm. Patterson is also familiar with Canadian conditions, having been a member of the staff of B. & S. H. Thompson & Co., Montreal. Baxter, Patterson & Co. have secured commodious offices and warerooms at 102 St. Antoine street, where they will keep a full stock of the lines they handle.

Practical Questions and Answers

Cross Section of Boiler Tubes.

Ques.—What are the considerations which determine the cross section of boiler tubes, and their length relative to the cross section ?

Ans.—The area of the cross section of boilers must be sufficiently great to permit the free passage of the flue gases, and yet the area must not be so large that the gases will take a short cut through the tubes most nearly in line with the natural flow, else the rest of the tubes will be practically ineffective. Should this occur the gases will go up the chimney at an abnormally high temperature, and the total heating surface will not be utilized, resulting in the boiler being of less capacity than it was designed for. On the other hand, should the cross section of the tubes be too little, the flow of gases will be very sluggish, resulting in the depositing of an extra amount of soot upon the tubes, among others evils.

The diameter of the boiler tubes depends upon several factors and because of that no definite diameter can be fixed upon until all the conditions are known. The diameter of the tube depends upon the amount of hot gases which will enter the tube, and since that depends upon the draft, the diameter of the tube must depend upon the draft. Then again, the diameter of the tube being constant, the greater the draft the longer must be the tube in order to provide the requisite heat absorbing surface. Thus in locomotive boilers the tubes are small in diameter and long, while the tubes in a marine boiler are large in diameter and short. In fact, the whole question is involved in the problem of supplying the correct amount of heating surface to economically absorb the heat entering the tubes. In marine and ordinary boiler practice the sizes of tubes usually adopted are $2\frac{1}{2}$ inches or 3 inches in diameter.

Grate Area of Boilers.

Ques.—Upon what does the grate area of a boiler depend, and what relation does the heating surface bear to the grate area ?

Ans.—The requisite grate area depends upon two things chiefly, the kind of fuel and the intensity of the draft. The lower the grade of fuel the larger must be the grate area, and the weaker the draft the greater must be the grate area. With good coal comparatively low in ash, approximately equal results may be obtained with large grate surface and light draft and with small grate surface and strong draft ; although with Pittsburg bituminous the best results seem to be obtained from a rapid rate of combustion, that is, small grate surface and strong draft. With good bituminous coal and good boiler, a high rate of economy is secured with a rate of combustion of from 20 to 25 pounds per hour per square foot of grate surface, which rate of combustion may be obtained with a draft equivalent to that given by a chimney from 100 to 150 feet in height. Practically the same economy may be obtained by halving the rate of combustion and doubling the grate area. It is very advisable to do this where the coal burned contains a large percentage of sulphur, else there may be trouble with clinkers and burned-out grate bars.

The necessary square feet of grate surface per horse-power varies from 0.09 square feet to 1.25 square feet, as the rate of combustion ranges from 40 pounds of coal per square foot of grate area to 8 pounds, and depending upon the kind of fuel and the boiler. However, with ordinary bituminous coal, some authorities claim that not less than one-third square foot of grate surface should be allowed to secure the best economy.

The ratio of heating surface to grate area is a very variable quantity as may be readily understood when the varying rates of combustion are considered, but it is general practice among builders, unless the specifications call for something different, to allow 12 square feet of heating surface per horse-power. The ratio of heating surface to grate area can be worked out from the number of square feet of grate area per horse-power and the number of square feet of heating surface per horse-power. Then of the heating surface a certain proportion should be tube surface ; common practice seeming to dictate about 85 per cent.

Compression for Producer Gas.

Ques.—What is the highest compression that can be used in gas engines with producer gas without there being any danger from pre-ignition ?

Ans.—Higher compression can be used with blast furnace gas, because the composition of that gas makes it less liable to premature ignition than is producer gas. The compression to which producer gas may be subjected in an engine has been the subject for experimental work for the last few years. Professor F. W. Burstall, of the Birmingham University, Birmingham, Eng., has for the last two years been experimenting along this line with a 120-horse-power experimental gas engine in which the compression can be varied from 80 to 225 pounds per square inch, the experiments being conducted with Mond producer gas. The experiments have not been completed as yet, but the results of the experiments already conducted are of considerable interest. Experiments were conducted with the compression as high as 175 pounds per square inch. Up to that compression there was no trouble with premature ignition, due mainly, Prof. Burstall says, to the thorough scavenging of the cylinder and the simple shape of the combustion chamber. This is, of course, a much higher compression than has been used with producer gas except when water injection has been used to cool the charge. These experiments seem to show that with a properly scavenged engine very high compressions may be secured, and Prof. Burstall makes the propheey that the gas engine of the future will use very high compression, probably as high as 350 to 400 pounds per square inch.

NEW SMELTING PROCESS.

Australian inventors claim to have perfected a new process for the treatment of iron ore. This method, called the Heskett-Moore Pattern, was given a test recently at Melbourne, where operations were in full force for the treatment of ferruginous ore for the manufacture of iron and steel, by a direct and continuous method of manipulation. A number of experts present expressed the opinion that the trial was most satisfactory, and that the process would revolutionize iron and steel manufacture.

BUFFALO FIRM TO BUILD IN CANADA.

In reply to an enquiry by Canadian Machinery, the Buffalo Tool & Machine Co., dealers in machinery, Buffalo, state that they are preparing plans for the construction of a six-storey steel building at 172 Front street west, Toronto. The building will have a frontage of 45 feet and a depth of 119 feet, and will have facilities for the handling of machine tools and woodworking machinery of all kinds, both new and second-hand.

It is also the intention of the company to manufacture a line of woodworking machinery, such as band saws, jointers, planers, etc.

The business will be organized and carried on under the name of the Buffalo Tool & Machine Co., but will be a distinct corporation from the Buffalo firm.

Tricks of the Trade

Everybody is invited to contribute to this page. Send in your ideas, odd jobs you are doing, and anything of interest to fellow-workmen. Remuneration will be made for such contributions. [Ed.]

SYSTEM IN KEEPING TOOLS.

VERY few large machine shops have not a system, more or less elaborate as the shop may require, of keeping track of tools that are used by the mechanics throughout the shop, but in the smaller shops this is not so. However, there is as much need for a simple system in a small shop as there is for a more complicated one in a large shop, and for that reason the following description of a simple system being adopted in a small Canadian machine shop will be interesting and, perhaps, suggestive.

Before this system was adopted free aecess was had to the tools by every mechanic, and consequently no person was responsible. One need not have been on the spot to know the result of that. Sometimes tools were replaced and sometimes not; nor could one find where a tool was without making a tour of the shop, thus losing considerable time and patience. Then, too, it is not good for tools to be lying anywhere and everywhere around a shop, as they would be where no person is responsible for their return; and again, the careless would be led to be still more careless since the "boss" would not necessarily know about the breaking of a drill or the smashing of the teeth in a milling cutter.

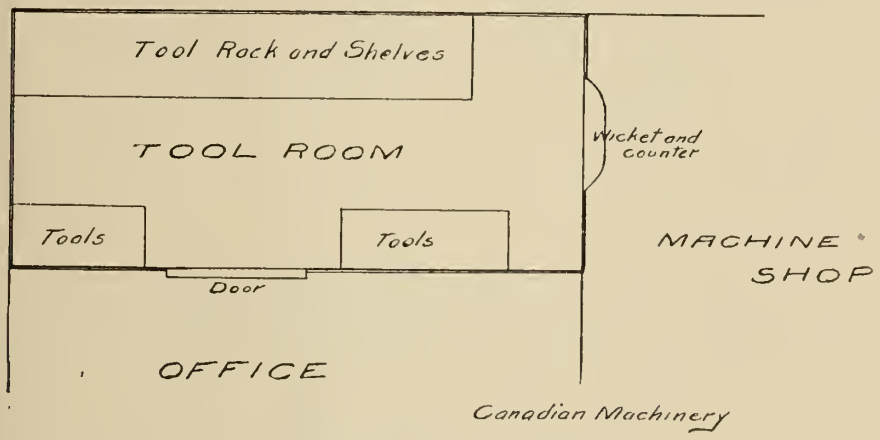


Fig. 1.—System in Keeping Tools.

The chief reasons for having a system of looking after tools are to save time and to prevent any unnecessary wear and breakage of the tools. To carry out these ideas there must be a tool storage room, admission to which should be allowed to no one but the person in charge. In this tool room should be a place for each tool, and when that place is not occupied by the tool there should be some record to show where it is. Under these conditions no tool is ever lost track of, and someone or another is responsible for its safety at all times.

In a small shop the number of tools is not great, and the system required need not be at all complicated. In the first place, the tool room should be so situated that the person appointed to look after it will lose as little time as possible in attending to the needs of the mechanics and getting back to his own work. The tools should be so arranged as to be easily seen and handled. There should be some system of numbering the tools, the number being marked on the tool in some way and also on its position in the tool room. Sheets should be made out with these numbers on them, and when a mechanic takes out a certain tool he should be required to place his initials or his check number opposite the number of the tool on the sheet, and when he returns the tool a line can be drawn through the initials or number. In a small shop this would probably be found satisfactory, as there would not be such a number of mechanics as to make it difficult to find a man by his initials, but, of course, if check numbers are employed there should be a key to them made out for the tool room.

Figure 1 shows the layout and position of the tool room with respect to the rest of the shop. As is seen, there is a wicket and counter between the tool room and the machine shop, where application is made for tools. The tool room is attended by someone in the office, the door being placed as shown. There is a push button placed on the counter connected with an electric bell in the office, which is used as a call bell. There is a solid partition between the office and tool room, but above the counter between the machine shop and the tool room there is wire netting, which effectually closes off the room without shutting out the light.

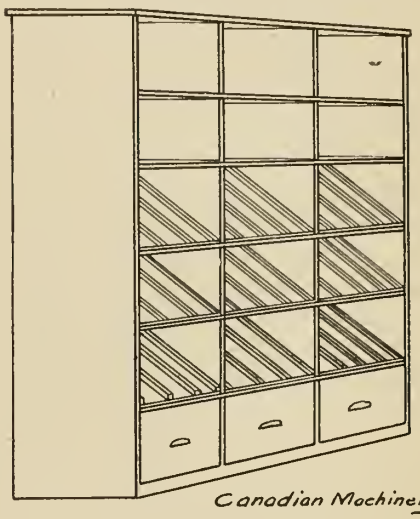

Fig. 2.—System in Keeping Tools.

The room is lighted efficiently from the office and shop. Figure 2 represents the style of shelves used to hold the tools, the sloping, grooved shelves being used for such tools as taps, drills, files, etc., while the drawers are used for small miscellaneous tools and supplies. Figure 3 shows the manner of keeping milling cutters. It consists

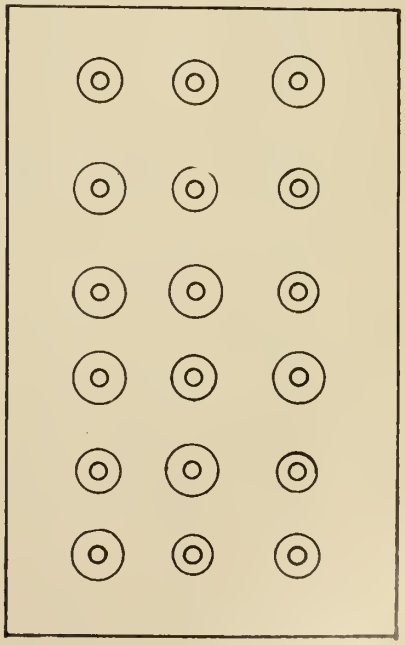

Fig. 3.—System in Keeping Tools.

merely of a board provided with spikes over which the cutters are hung. In this system the tools are arranged in convenient classes for storing, each class being kept by itself and donated

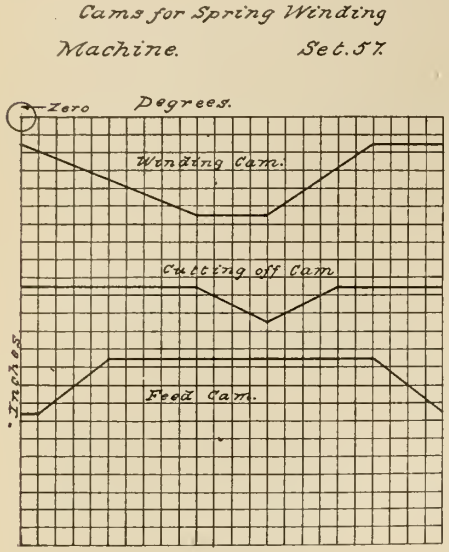

Fig. 1 —Keeping Cam Records.

by a letter of the alphabet. Each tool in the class is denoted either by its size or by a number. Each department of the shelves or room devoted to a class of tools is labeled with the letter denoting that class, and each tool in a class has a place, and that place is denoted by the number or size of the tool, and the tool itself is marked with its group letter and with its number or size. Sheets are made out on which are printed the tool numbers or sizes grouped in their respective classes, and when a mechanic gets a tool he makes his initials after the tool number or size, and upon its return a line is drawn through his initials, relieving him of all responsibility. Thus a tool cannot be lost or broken without some person being responsible; nor is time lost in hunting for tools, since if the tool is not in the tool room the mechanic having it is known from the sheets.

The tool room in a small machine shop might also be used as a storeroom, and a store's system be arranged in conjunction with the other system.

J. C. A., Toronto.

KEEPING CAM RECORDS.

IN these days when records are kept of almost everything immaginable in both office and factory regarding cost of production, time, etc., it would not be out of place if another leaf were added to the book and a record kept of the anatomy of the different machines.

I do not intend to make any analysis of different kinds of cams or their value for different work, but simply to show how system in connection with cams, as with anything else, is a time-saver.

In designing a machine, after the different parts have been roughed into place and the cam shaft located, a set of cards similar to Figs. 1 and 2, should be made, to some scale as ¼ in. to 1 in. The card should be inked in, also the zero point, after which the cam parts should be laid out lightly in pencil. This allows you to see that no cam interferes with another, and also allows you to divide up the revolution of the cam to suit the different work done by the tools connected to it. After this has been done a card like Fig. 2 should be made, one for each cam, and the cam paths penciled in. If the curves are shown to be too severe changes must be made which should be recorded on Fig. 1. When the paths of the cams have all been laid out so that

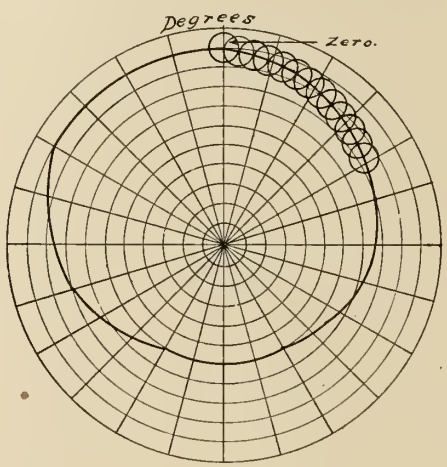

Fig. 2 —Keeping Cam Records.

the curves are soft and timed not to interfere with one another, they should be inked in and any notes which may be considered of value for future reference made on the back of the card. A number is now given to the set, and it is filed away in a book of the loose leaf style under some heading suitable for this style of machine. In the case given in Figs. 1 and 2 they, with the rest of their set, would be filed under the heading of "wire machinery."

Should any change be made at any future time they should be recorded in a note on the back of the cam the change has been made on, and the change marked in on both Figs. 1 and 2, in a different colored ink. By doing this you have a complete history of each cam on its own card in Fig. 2, and also a complete record of its relation to all the other cams on the machine in Fig. 1.

Should a similar machine have to be built at any other time, or should it have to be modified to do some somewhat different work, involving more cams, by looking up the cam record you can at once find where the change can be made, and then, too, the notes on the back tell how the different cams are situated as regards time, and you can at once see whether they have any to spare. This informs you in an instant just which cams can be crowded and which cannot be crowded.

Much other information as well can be kept, such as a record as to which is the best style of cam, barrel or face, for any particular work; the best size of roller and length of face; the best speed for such a cam, whether positive or spring return, and many other notes which may come to you as you lay out the cam.

H. GEARING, M.E.,
Toronto, Ont.

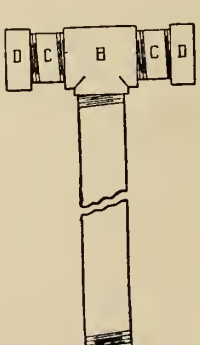
PISTON AND SLIDE VALVES.

The object of piston valves originally was to take the place of large slide valves which could not be made tight and were therefore ineffective. In action the piston valve decreases the friction and increases the port opening for the same space occupied by the valve. A typical shape of a piston valve is a D slide valve wrapped in the form of a cylinder.—Compressed Air.

HAMMER MADE OF PIPE.

A very handy hammer can be made for little or nothing, provided one has a few old materials on hand.

Into a ½-in. tee (B) screw a piece of ½-in. pipe (A) about 8 in. long with threads on one end and two pieces of ½-inch pipe (CC) 2½-in. long with



Hammer Made of Pipe.

threads on both ends. On the ends (DD) put ½-in. caps.

A larger hammer can be made by using pipe of larger dimensions, and the hammer can be made heavier by stopping up the tee and filling the head with lead.

Mechanical Reviews

OPINIONS AND STUDIES WORTH NOTING

AN EXPERIMENT IN MILLING.

THE object of this experiment was to determine whether there was any saving in milling two rows of castings, of the shape illustrated in figure 1, set side by side, over milling a single row.

The machine used was a No. 5 Cincinnati milling machine.

The arbor and cutters are illustrated in figure 2. In milling the two rows a second gang of cutters was used on a longer arbor, with a support between the two gangs, using, however, the same diameter of arbor. These cutters were

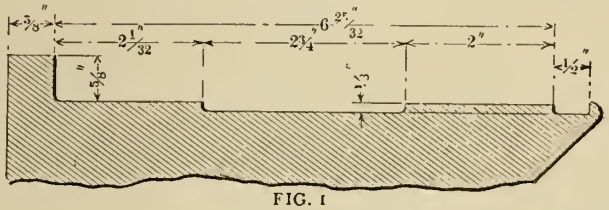


FIG. 1

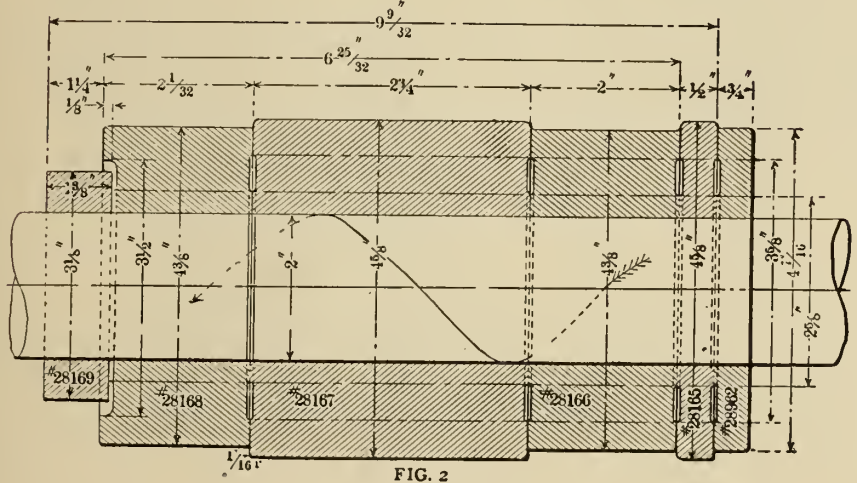

FIG. 2
An Experiment in Milling.

made of high speed steel, and in both cases the machine was pushed to its full capacity, consistent with obtaining work free from chatter. The size of the arbor was limited to two inches by the size of the tapered end, and the latter was once twisted off in the experiments with double rows.

From the experiment it was found that a cut of 0.247 inch per revolution of cutter was the most practical limit for milling the single row, this being equivalent to a table travel of about four inches per minute, for a total width of cut of about 8½ inches, and average depth of cut about 5-32 inch.

For the double rows it was found that 0.098 inch was as fast a table travel as was practical with the same speed and feed of cutter, or about 1½ inches travel per minute; for a total width of cut of about 17 inches; and while the time consumed in setting up the two rows was a little less than twice that for setting up one row, this saving was so slight that it did not at all offset the longer time for milling. In both cases we worked up to the pulling capacity of the belt, a four-inch double belt, and in fact were overloading it.

With the single row we were removing roughly 5.3 cubic inches of metal per minute; with the double rows only 4.2 cubic inches.—"Ford," in American Machinist.

GAS ENGINE VALVE CONSTRUCTION.

IN designing machinery it is important to consider each detail in the light of the service or duty required of it. Too often the inventor, anxious to achieve the end sought in the machine itself, neglects the correct designing of its parts, as a consequence of which the machine is no sooner completed than it has to be redesigned. It may be that on trial some detail gives out, or it may be only that some difficulty in manufacturing has not been foreseen. Either is sufficient to discourage the capital the inventor is endeavoring to interest.

To design and lay out an inlet or exhaust valve for a gas, gasoline or oil engine, consideration should first be given to the requirements of each section. Allowances must be made for the forces tending to fracture the material of which the valve is made and the tendencies to destroy surfaces of bearings or seats. A typical valve might appear as shown in Fig. 1 of the illustration. Beginning at the thread end, this should be of a composition such that the thread will not change its form and thereby cause the nuts to tighten or loosen when the valve is in service. If collars are substituted for nuts the stem should not upset and make it difficult to remove the collars for cleaning and repairing. If an analysis does not show a proper proportion of the elements it may be expected that the stem will be likely to bend under the stress of service and cause the valve to remain open from friction in the guide. Of course the dimensions are to be considered as well as the composition. A bending of the stem would tend to throw one side of the disc or valve proper off its seat, thereby destroying the compression to a degree that would result in a poor performance of the engine.

The expense of machining the valves must also be borne in mind to keep down the cost, not only of the complete engine, but the selling price of the valve when ordered for repairs. A great deal of new business has been lost simply through the high prices charged for detail parts. Valves of this style, with stems up to 1 1-2 in. in diameter, may be finished in a monitor or turret lathe at a very low figure if the stock is suitable in composition. For the threaded end (A) of a valve the following composition is recommended:

	Per cent.
Carbon	0.16
Silicon	0.11
Sulphur	0.034
Phosphorus	0.029
Manganese	0.51

The next section to be considered is an important one—the body and wearing section (B). On it depends the keeping of the valve in position, without noise, caused by lost motion in the guide. This section should be as hard as possible without sacrificing other important features. A fairly high grade of tool steel, with, say, 0.65 per cent. carbon, will give good results, as it may be hardened and ground true to gauge. The uncertainty of lubrication at this point in the engine makes a hard section desirable. In the making of these valves it is good practice to rough out all parts to within about 1-32 in. and then anneal the stock, before grinding to size, to remove all strains that may cause trouble when subjected to the temperatures of the engine cylinder and valve chest.

At this point it might be well to emphasize the importance of finishing all valves strictly to gauges and make them standard. It means much to the purchaser, as it allows him to make repairs with very little loss of time. Equally essential is it that provision be made for wear in the valve chest by the use of a bushing ground to gauge, that may be renewed when the new valve is put in.

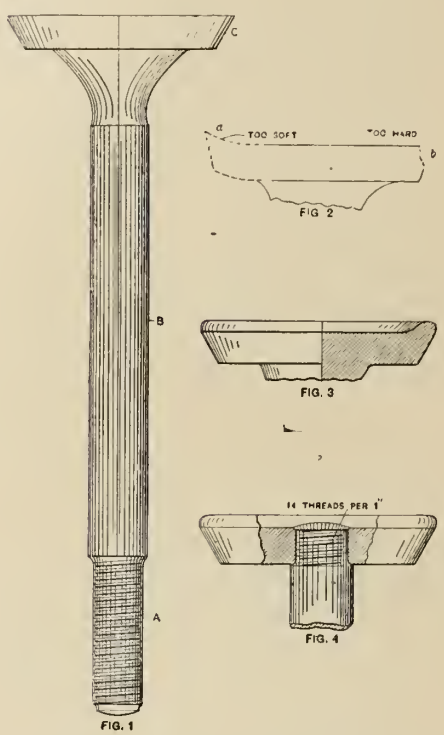
The last section of the valve, and the one that gives more trouble than any other, is the valve disc. If the material is too soft the edges will turn up, as shown at (a) in the detail, Fig 2; if too hard they will crumble and break off, as shown at (b). There is also a tendency to cutting at these points from the action of the exhaust gases, which will be considered later. To reinforce the disc edge and give strength to resist destruction a change in design, as shown in the second detail, Fig. 3, will provide additional stock, but not enough to materially increase the weight of the valve, a matter of moment in a high speed engine. Good results for medium speeds are secured with a composition showing:

	Per cent.
Carbon	0.12
Silicon	0.11
Sulphur	0.041
Phosphorus	0.053
Manganese	0.34

To construct a valve as described above recourse is had to electric welding and grinding for finish. A valve may be built up, as shown in the lower detail, Fig. 4. that will give good service and at small outlay. The disc may be made from a good close grained gun iron and the stem from steel showing a composition of

	Per cent.
Carbon	0.16
Silicon	0.11
Sulphur	0.034
Phosphorus	0.029
Manganese	0.51

The body or guide may be case hardened, leaving the two ends soft. This can be readily accomplished by packing the stems in hardened boxes, with the hardened compound surrounding the bodies only and the ends covered with clean sand. The thread in the disc should not be coarser than 14 to the inch in valves up to about 3 in. in diameter. The discs should be put on hot and the stem riveted over.—H. S. Brown, in Iron Age.



Inlet and Exhaust Valve Showing Details.

DETERMINATION OF PHOSPHORUS AND ASH IN COKE.

As every chemist knows, who has coke analyses to make, the methods in use at the present time for the determinations of phosphorus and ash are very long and tedious, and a method which would considerably shorten these determinations would be welcomed.

The method here given first originated in the laboratory of the New Jersey Zinc Co., Hazard, Pennsylvania, and has never to my knowledge been in print.

Ash.

Brush one gram of finely powdered coke into large weighed platinum dish of about 150 cc. capacity; add enough absolute alcohol to sample to make a thin paste. Now revolve the dish slowly so as to cause the thin paste to run up along the walls of the dish. Keep up this motion until all the alcohol is evaporated and there remains only a thin film of sample over the walls and bottom of dish. Now place the dish over a blast lamp, or in a muffle furnace, and in five to seven minutes the carbon will have been entirely burned off, the ash remaining. Weigh and calculate percentage of ash.

Phosphorus.

Five to ten grams of sample should be taken. Proceed as in ash determinaion. When the carbon has all been burned off, add to the ash in dish 10 cc. of dilute HCl and 29 cc. HFl. Evaporate to dryness under a good hood, but do not bake. When cool add 15 cc. of HCl and heat. The residue should all dissolve, but a little insoluble matter may be filtered off and neglected. Pour the solution into a flask, add NH_4OH, then HNO_3, and then molybdic acid solution, and "shake down" phosphorus. The yellow precipitate may be either weighed direct or titrated.—John F. Hoy, in Iron Trade Review.

RELATIVE POWER OF TWO AND FOUR CYCLE ENGINES.

S. M. HOWELL, in the Gas Engine, says that it has been his experience that two and four cycle engines of the same size and both of the best possible construction will develop about an equal amount of power, up to 700 or 800 feet of piston speed per minute, but beyond that speed the four-cycle system will defeat the other, and at the highest practical speeds will develop about 25 per cent. more power. At lower speeds, however, say up to 500 feet per minute, the two cycle will frequently show as much as 50 per cent. more power than will the four cycle engine of the same bore and stroke.

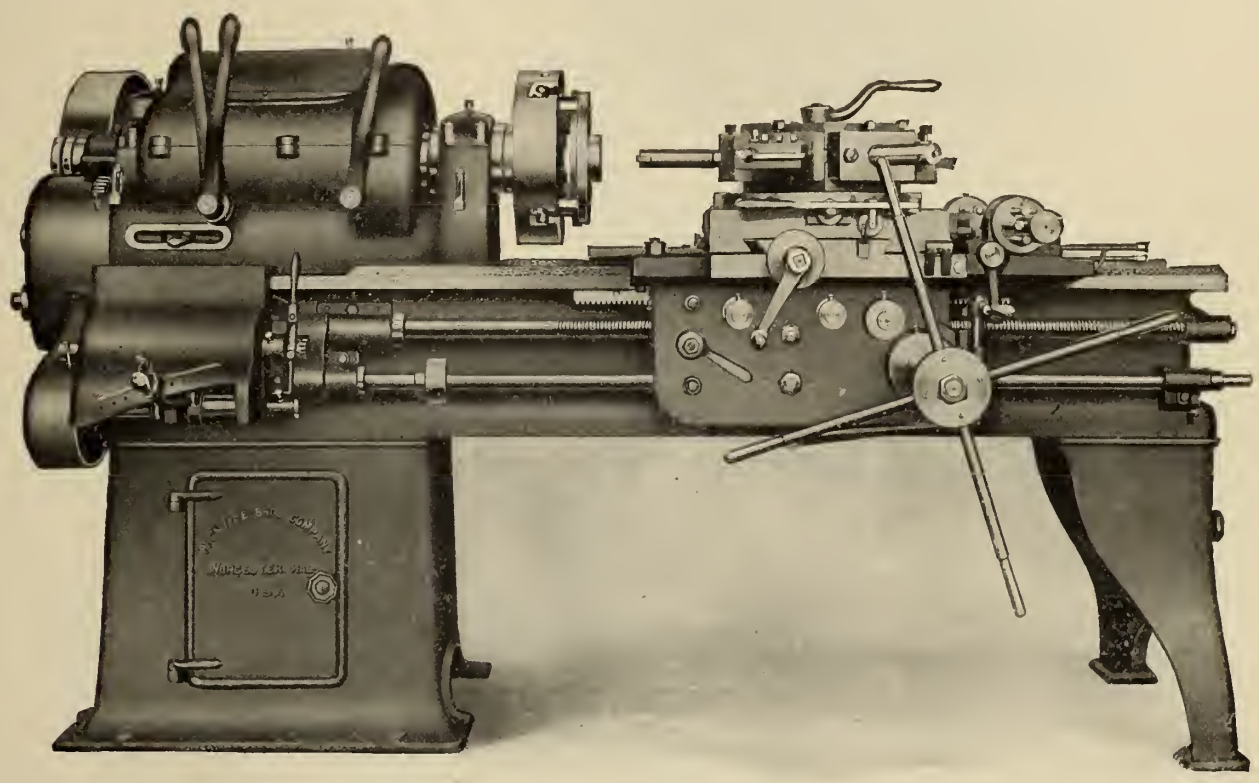
It will be convenient in estimating the amount of coal for hoisting engines and the like, to use the following figures: Allow one-third of a ton of coal for each 10 h.p. per 10-hour shift. This rule holds good for most engines up to 80 horsepower.—Compressed Air.

For removing sand from small brass castings, hydrochloric acid one part and water ten parts makes about the best solution that is used in ordinary practice.

Machinery Development

Metal Working **Special Apparatus** **Wood Working**

NEW PRENTICE TURRET LATHE. THE accompanying illustration is of the new geared head high speed turret lathe recently placed on the market by the Prentice Bros. Co., Worcester, Mass. The machine was designed especially for the rapid machining of cast iron parts such as gears, pulleys, etc., which require two or more operations. The lathe has a 15-inch swing. The geared head gives eight changes of speed, and it is provided with a change feed gear box giving thirty-three different feeds. The turret is hexagonal and



New Prentice Turret Lathe.

of heavy construction, and is provided with hand and power cross and longitudinal feeds, with adjustable stops for feeds in all directions. There are six stops for the longitudinal feeds, which revolve automatically with the turret, or which may be used independently by disengaging the stop drum, thus rendering it possible to use one tool for more than a single operation. The cross feed has twelve adjustable stops, six in either direction, which are operated independently of the turret. All stops are numbered. The wide range of cross traverse makes necessary the wide range of speeds provided in the head.

To provide for rotating the drum carrying the six adjustable stops for the longitudinal feeds when the turret is rotated, an interesting mechanism is employed, which is independent of the crosswise position of the turret. On the bottom of the turret is cast a large bevel gear which meshes with a bevel pinion splined to a shaft extending at right angles to the bed, the pinion being free to travel on this shaft when the carriage is fed crosswise. The ratios between the gears is 7 to 1, and hence for each 1-6 revolution of the turret the shaft will make 1 1-6 revolutions. The shaft through miter gears transmits its motion to a longitudinal shaft, which is connected by spur gears to the shaft of the stop drum, giving to the drum 1 1-6 revolutions to each revolution of the turret, which brings the proper stop into position for each position of the turret.

The apron is so arranged that the operator may start, stop or reverse both the longitudinal and transverse feeds at will. The longitudinal feeds are tripped automatically by a mechanism behind and at the side of the apron. To reverse the feed a spring stud dog is turned through 45 degrees which permits it to pass its stop. This causes the clutch in the apron to engage the opposite bevel pinion which reverses the feed. This device operates the reverse for both feeds.

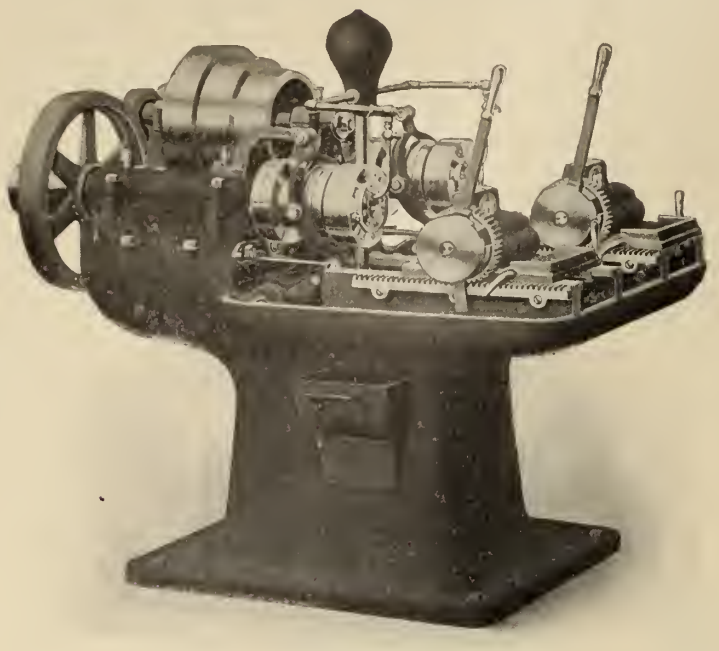
The lathe is provided with a screw which will permit the cutting of any standard thread. A simple locking device is provided to prevent the simultaneous engagement of the separable nut on the feed screw.

More detailed information regarding the operation of the lathe may be had from the makers, Prentice Bros. Co., Worcester, Mass.

A large new saw mill will be erected in New Westminster by a number of American capitalists, headed by C. R. McLaughlin, Columbus, O. The site for the mill has already been cleared, and extensive timber limits have been secured.

SPINDLE BOLT CUTTER.

HEREWITH is illustrated a double bolt cutter made by the National Machinery Co., Tiffin, O., and a view of the "National" head used on all the National bolt cutters is also shown. The points claimed for these machines are: Their ability to cut a thread of uniform diameter, thus giving perfect fit, and the thorough handiness of operation.



National 1½-inch Double Bolt Cutter.

A description of the operation of the head will be of interest. The head consists essentially of: A main body or barrel, a die ring resting on the barrel near the end, which moves back and forth over the dies, forcing them in or out by means of their inclined tops; two rocking levers or dogs which determine the position of the die ring; and a clutch ring, controlling the dogs.

With the head open, if the clutch ring is forced forward, it slides over the curved upper sides of the dogs forcing them to swing inward, and they in turn push the die ring forward, sending the dies toward the cutting position; when this position is reached the clutch ring moves onto the shoulders of the dogs and effectually locks the head.

These two shoulders then being parallel to each other no amount of outward pressure against the dies can force the clutch ring back, and it is prevented from working off by two spring-cushioned spline screws that pass between it and the die ring. These screws also serve to pull back the die ring in opening the head, and the springs both eliminate lost motion on the die ring, and prevent any cramping on the dogs when opening.

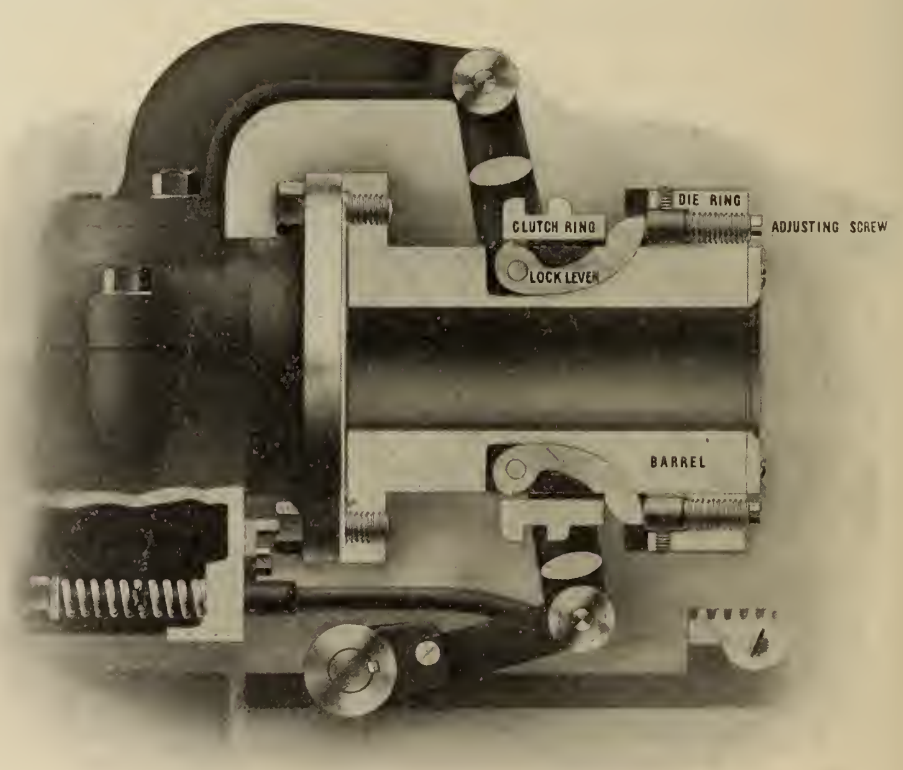
The noses of the dogs do not bear directly on the die ring but on large ends of the adjusting screws. Obviously, when the screws are turned one way or the other the location of die ring on barrel is correspondingly altered, and here is where minute adjustments for under or over size diameters are made.

To change dies, a catch on the front of the head stock is simply thrown, which permits the die ring to move backward until it entirely clears the backs of dies, and these can then be readily removed and others substituted.

The barrel, clutch ring and die ring are semi-steel; the dogs and adjusting screws are hardened tool steel; the inclines in the die ring and several other contacts are protected by tool steel inserts.

Once closed, the head is practically as solid as a single piece, and such wear as can occur must be during opening and closing operations. The dies are braced against the head itself. Lost motion in the head is prevented through the spring or weighted contacts on the locking device, and lost motion outside the head can not affect the diameter of the work. For instance, end play in the machine's spindle will not matter provided it does not exceed ¼ inch or so, and this amount would simply trip the head.

Lost motion is fatal to the cutting of good threads. When the operator closes the dies he does it quickly, and the head and all are thrown forward, leaving the dies too far in, if slack is present. Then when the cut begins the diameter will be undersized, and one or two nut thicknesses will have to be threaded before the dies are finally forced back to a solid support. And this means that a nut will not fit right where it will probably rest—near the bolt's end.



View of National Head, Dies Closed.

The Philip Carey Co., of Lockland, O., are negotiating with Brantford with a view to establishing there. They manufacture felt roofing, etc.

PLANER TYPE MILLING MACHINE.

THE accompanying cut is of a planer-type of milling machine developed by the Becher-Brainard Milling Machine Co., Hyde Park, Mass., to provide for the demands of modern milling machine practice. Special attention has been given in the design to secure strength and rigidity of construction.

The spindle is made of hammered crucible steel, has a threaded nose and runs in self-centering bronze boxes with nut and check-nut to compensate for wear. The spindle carrier is very heavy and is held firmly to the upright by long gibs. It is elevated by a screw with adjustable dials graduated to thousandths of an inch and has counterbalance for ease of operation. The spindle has 20 changes of speed, and by means of hand lever and quick change gearing, the speed is easily adjusted.

The table is very heavy and is regularly built with five T slots lengthwise and an oil channel the full length and at each end. It travels on flat ways securely gibbed and has a quick return operated by power from a separate countershaft. It can also be moved by the usual hand wheel. The feed of the table is directly operated through gearing from the main driving cone, giving a range of feed through eight changes from 3-64 to 3-8 inches. These changes of feed can be made instantly, by means of a lever, without stopping the machine.

The feed of the table is directly operated through gearing from the main driving cone, giving a range of feed through eight changes from 3-64 to 3-8 inches. These changes of feed can be made instantly, by means of a lever, without stopping the machine.

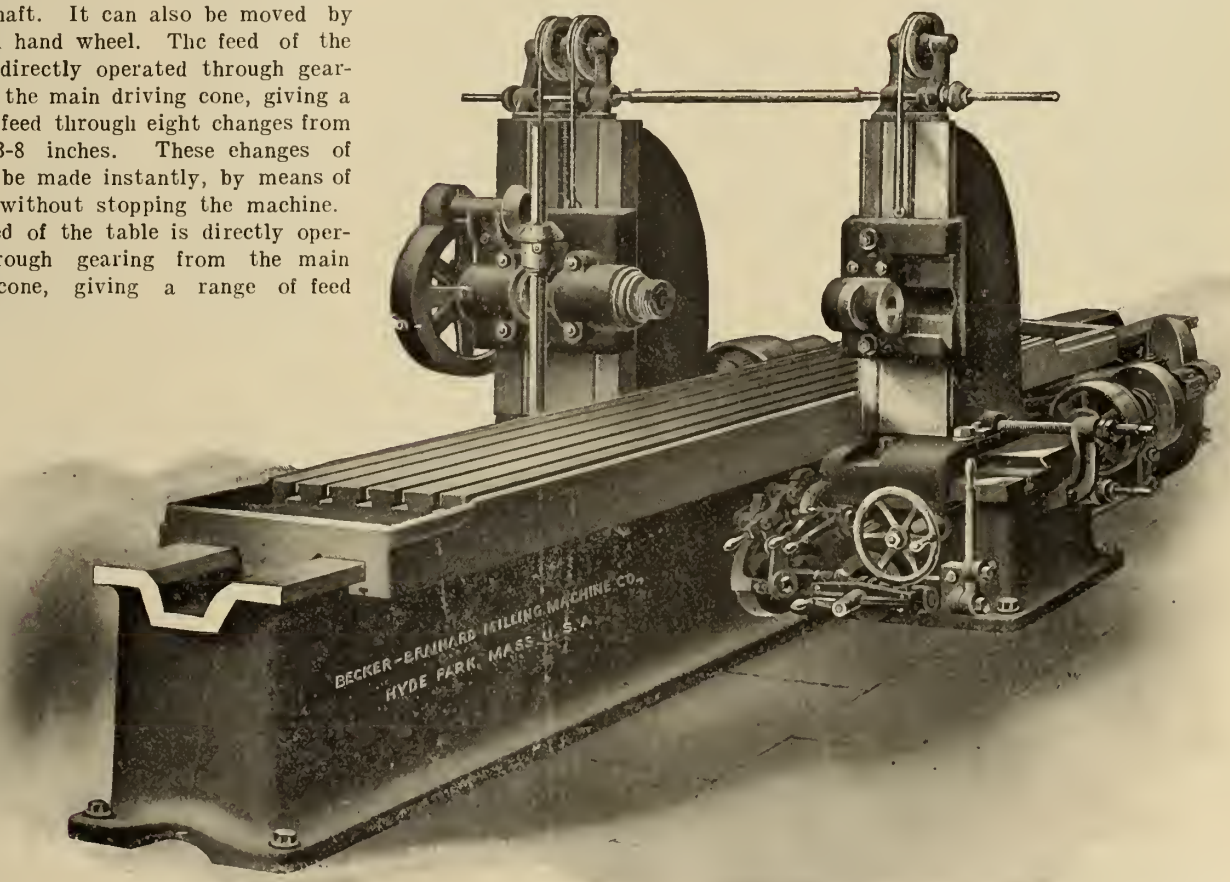
The head may be adjusted from either side of the machine, so that it is not necessary to take the cutters off the arbor in order to change their position in relation to the work.

New Style of Forge.

The bed is extra deep, extending to the floor and making a solid foundation. It is securely braced by heavy cross girders which are evenly spaced throughout the entire length. The bed can be made any length desired.

NEW STYLE OF FORGE.

THE accompanying illustration is of a barrel forge placed on the market by W. H. C. Mussen & Co., Montreal, and as may be seen is a very neat and compact forge. It is designed to take the place of the ordinary three and four leg rivet forges. The blower and its supports are placed inside the barrel, which gives this machine great stability, which is a feature of no mean advantage when it is considered that these forges are used chiefly for structural steel work and must be balanced usually on a beam. With the old type of forge it is a frequent occurrence for the machine to upset, breaking the blower and calling for an expenditure practically equal to the cost of a new forge, as the blower is the most expensive part. Moreover, with the old type unless the blower is taken off every night and placed in the tool box it may readily be stolen, for it is a simple matter to detach the old type of blower from the frame. With this forge, however, the blower is securely fastened inside, protected from thieves and from the weather, and placed where it cannot possibly become damaged. The top is so formed that it may be closed down at night, thus forming a



Planer Type Milling Machine—Becker-Brainerd Milling Machine Company.

tool box, which is provided with a padlock as shown in the illustration.

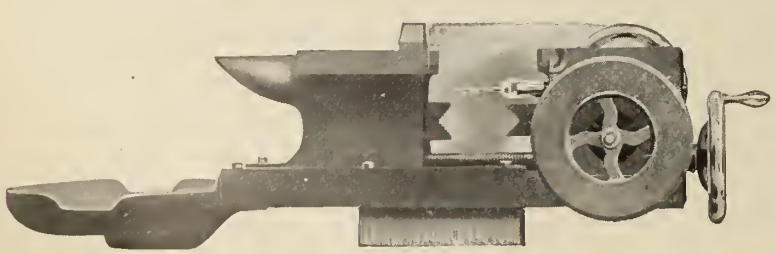
NEW STYLE OF DRILL CHUCK.

A NEW style of drill chuck has recently been placed on the market by the Wide Range Drill Chuck & Tool Co., Muncie, Ind., known as the "wide range drill chuck." The company have been experimenting for some time past to perfect this drill chuck, and the following good points are claimed for it: Strength and durability; smallness of size for its range

New Wide Range Drill Chuck.

of duty; ease of operation; it will take the shank of any kind of drill, whether new or old; being absolutely positive it has no wearing parts; it is self-centreing and always true; it is made with no small or complicated parts; the smallest or largest drill can be placed in the chuck by the pressure of the thumb and finger so that it will never slip.

The accompanying illustration shows a view of this drill chuck.



Detroit Combination Tool.

THE DETROIT COMBINATION TOOL

THE Detroit combination tool is a general utility tool combining a drill, a vice, a pipe vice, an emery wheel, an anvil, a forge and blower for the forge, recently placed on the market by the Detroit Tool Co., Detroit, Mich. The tool is the outcome of an attempt to combine in one tool all the necessary equipment of a repair shop.

The tool consists of a steel-faced bed or base, having at one end a stationary head stock, at the other a movable tail stock and an overhung forge pan. The head stock contains the mechanism of the rotary blower, drill, grinder and the stationary part of the vise and pipe vise jaw. The tail stock serves as an anvil, a support for work being drilled and the movable member of the ordinary and pipe clamping vises. This part slides on the bed between two adjustable guides and is operated through a screw by the hand wheel at the outer end of the head stock. The air delivered by the blower in the head stock is conveyed through a channel in the base to the forge at the opposite end. The fan shaft of the blower projects through the air intake at the front side of the gear case and is fitted to receive an emery wheel, the intake being so located as to form a current of air drawing the emery dust into the forge and away from the operator. The blower and emery wheel are operated by a crank wheel located on the rear side of the gear case. The drill is operated by the same driving wheel, being fitted with a clutch arrangement so that it may be thrown in and out of gear at the will of the operator.

GROOVED SHANK CHUCK.

THE accompanying illustrations are of a style of chuck made to hold twist drills, reamers, etc., which are grooved at the shank with parallel grooves to a uniform depth and angle, the jaws of the chuck corresponding to the shape and size of the grooves. This chuck is designed to prevent all possible turning or drawing out of the tool, and to make it possible to hold with one chuck, a complete range of sizes of drills or reamers and to tighten or release them without the use of any outside tools.

This chuck is manufactured by the Detroit Twist Drill Co., and has but recently been introduced into Canada, the Ontario sales agents being Baines & Peckover, Bay street, Toronto. The chuck has already become quite popular in Canada, which is shown by the fact that A. B. Jardine & Co., Hespeler, Ont., and Butterfield & Co., Rock Island, Que., are about to commence making reamers and other tools with grooved shanks to fit this chuck. There has been a small circular issued, which brings out the points

of advantage in the chuck strongly, and this circular may be obtained from the sales agents, Baines & Peckover, 124-126 Bay street, Toronto.

STEAM VS. ELECTRICITY.

The conclusion of the committee of five practical steam-railway officials appointed by the American Railway Mechanics' Association to report on electric versus steam railways, after a thorough investigation in Great Britain and elsewhere, is that where there is sufficient diversity of traffic it will pay steam railways to work their suburban and interurban traffic electrically, but in such cases the traffic should have its separate tracks. The statement is somewhat modified by the qualification that "few situations will figure out profitably with the combination service"—that is, the employment of both steam and electricity. As to the relative cost of operation with electricity or steam the committee reports that there is very little accurate information of value.

ABOUT CATALOGUES

By mentioning Canadian Machinery to show that you are in the trade, a copy of any of these catalogues will be sent by the firm whose address is given.

Lighting Industrial Plants. "The Economical Lighting of Industrial Plants" is the name of a very neat little booklet issued by the Cooper Hewitt Lamp Co. It is well illustrated with views of departments in different plants, which are lighted with the Cooper Hewitt lamp.

Nernst Street Lighting. A bulletin issued by the Nernst Lamp Co., sales agents for whom in Canada are the Canadian Westinghouse Co., Hamilton, illustrating and describing the Nernst series alternating vertical glower street lighting system.

Revolving Field Alternators. Canadian Westinghouse Co., Hamilton, June 1906 bulletin illustrating and describing the Westinghouse revolving field alternators. The machines are illustrated and described in detail and illustrations of recent installations are given.

Electricity in Heavy Railway Service. A very handsome bulletin issued by the Canadian Westinghouse Co., Hamilton The bulletin is exceptionally well illustrated with views of cars in service, railways and motors.

The Cone Gas Generator. Catalogue of the Cone Gas Machine Co., Detroit, illustrating and describing the cone gas producer. The catalogue is printed in colors; size, 5 x 8 1-2 inches.

Pittsburg Transformers. Catalogue illustrating and describing the various types of transformers made by the Pittsburg Transformer Co., Pittsburg, Pa. Size, 6 x 9 inches.

Standard Sand Mixer and Screen. A small booklet issued by the Standard Sand & Machine Co., Cleveland, giving a partial list of the users of the Standard sand mixer and screen.

The Burk Machine Co. A set of leaflets issued by the Burk Machinery Co., Cleveland, O., illustrating and describing some of the machines they manufacture.

Ice and Refrigerating Machinery. A 48-page booklet illustrating and describing the various types of horizontal and vertical ammonia compression refrigerating machines and equipment for ice plants, breweries, packing houses, etc., made by the De La Verge Machine Co., foot of E. 138th street, New York. The booklet is exceptionally well illustrated, there being composite views of plants installed in various parts of the world.

Saw Mill Machinery. The Wm. Hamilton Mfg. Co., Peterborough, Ont., are getting out catalogues of their machinery in sections now, instead of in a general catalogue as formerly. These catalogues include "Setting Machines for Saw Mills," "Edgers," "Lath Mill Machinery," "Log Handling Machinery," and "Improved Shingle Mill Machinery." All of these catalogues are very neat in appearance and are well illustrated. Size, 6 x 9 inches.

"Browning" Motors. Leaflet illustrating and describing the "Browning" motors and dynamos manufactured by the Northwestern Mfg. Co., Milwaukee, who are represented by the D'Olier Engineering Co., New York.

Industrias y Productos De Westinghouse. A very handsome catalogue printed in Spanish, describing and illustrating some of the products of the Westinghouse Electric & Mfg. Co., Pittsburg, Pa.

Polyphase Induction Motors. June, 1906, bulletin of the Stanley G. I. Electric Mfg. Co., Pittsfield, Mass., illustrating and describing in detail their latest design of polyphase induction motor.

Westinghouse Railway Motor. Circular No. 1035 illustrating and describing the Westinghouse No. 12A railway motor, being a revision of the circular issued in November, 1904.

A.C. and D.C. Motors. Catalogue of Westinghouse alternating and direct current motors for various purposes, issued by the Westinghouse Electric & Mfg. Co., Pittsburg, Pa.

Centrifugal Exhaust Heads. Bulletin No. 138, of the B. F. Sturtevant Co., Boston, Mass., descriptive of their centrifugal exhaust heads. The method of separating the water from the steam in these exhaust heads is very interesting.

Flinn Steam Trap. Bulletin No. 137, of the B. F. Sturtevant Co., Boston, Mass., descriptive of the Flinn steam trap. This trap is of the differential type, with water column and diaphram.

Electric Hoists, issued from the general offices of the Wellman-Seaver-Morgan Co., Cleveland, Ohio. This is a booklet of 36-pages, 6 x 9 inches, with a fund of information upon the subject of electric hoists.

Locomotive Cranes. Catalogue of the Wellman-Seaver-Morgan Co., Cleveland, O., on their locomotive cranes, buckets and tubs. The catalogue is well printed and well illustrated. Size 6 x 9 inches.

Single Bolt Cutters. The National Machinery Co., of Tiffin, O., are sending out a bulletin with a full descriptions of their National single bolt cutters. Much technical information on the subject is included.

Iron and Steel Works Equipment. This is a beautifully printed and illustrated book just issued by the Wellman-Seaver-Morgan Company, of Cleveland, Ohio. It deals with open-hearth and reheating furnaces, and contains many fine illustrations of installations which the Wellman-Seaver-Morgan Co. have made in different parts of the United States and Canada.

Miller Gas Engine. General catalogue of the Miller Improved Gas Engine Co., Springfield, O., illustrating and describing the Miller improved gas engine. The catalogue is well illustrated and the engine is described in detail.

Keyseat Milling Machines. Catalogue No. 44 of the Newton Machine Tool Works, Philadelphia, U.S., illustrating and describing the Newton keyseat milling machines. A new style of milling machine for the rapid milling of keyseats for feather keys or short splines is illustrated and described besides the ordinary machines. Size, 6 x 9 inches.

Stone Tools. Catalogue 19 of the Chicago Pneumatic Tool Co., Chicago, illustrating and describing the pneumatic tools used in cutting and carving stone. This is a very complete catalogue, and is well illustrated. Size, 6 x 9 inches, 48 pages.

Pumps, Gasoline Engines. Catalogue E. of the Brandon Pump & Windmill Works, Brandon, Man., illustrating and describing the products of the firm, which include pumps of all kinds, windmills and gasoline engines.

Electric Hoists. General catalogue of Yale & Towne, 9-15 Murray street, New Yorw, illustrating and describing their electric hoists for all classes of work. Size, 6 x 9 inches, 24 pages.

Steam Gas Electricity Compressed Air Water

WESTINGHOUSE VARIABLE SPEED MOTORS.

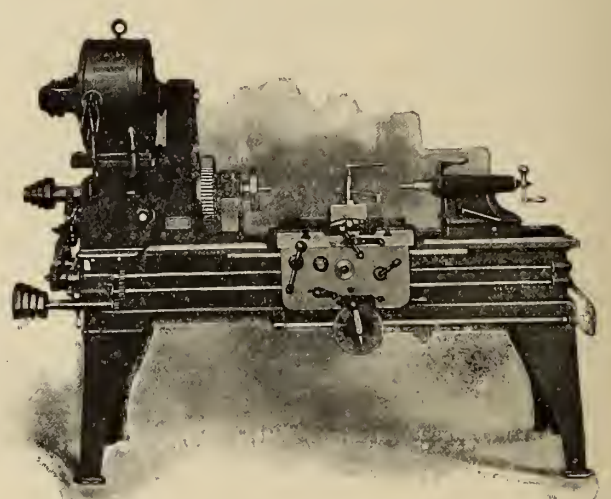
THE rapidly increasing use of individual motor drive on machine tools has led manufacturers of late years to spend considerable energy on the production of a variable speed motor. In individual drive there are several methods of obtaining speed change for the machine. Either a constant speed motor or a variable speed motor may be used for individual drive, change of speed in the case of the constant speed motor drive being obtained through a gear box; while speed change is obtained in the variable speed motor in different ways, according to the style of the motor. The speed of a motor is changed by varying the voltage applied to the motor or by varying the flux density. The applied voltage can be varied in two ways, either by switching the motor from a line of one voltage to a line of another voltage, or by changing the resistance in the armature circuit. It is a combination of these two methods that has been most commonly used. That is, a three-wire system of power distribution is used, thus allowing the applied voltage to be changed by means of a controller from 220 to 110, or the other way round, the intermediate speeds being obtained by varying the armature-circuit resistance. The outstanding disadvantage of this method is its inefficiency, because of the increased heat loss caused by the addition of resistance to the armature circuit. The regulation of speed is accomplished most economically by varying the magnetic flux. This is, of course, done by varying the current through the field coils by varying the resistance in the field circuit. The objection to this method in the ordinary motor is that in consequence of the distortion of the magnetic field caused by the changing of the flux density the brushes will tend to spark, and the greater the change the more sparking there will be. This sparking is caused by the brushes not being on the neutral points of the armature, the neutral points naturally changing as the magnetic field is distorted.

The interpole motor was designed to overcome this difficulty. In this style of motor a small pole is placed in between each two ordinary poles, the winding on which is in series with the armature winding. The polarity and strength of these poles is such that their action counteracts the effect of armature reaction upon the magnetic field when the resistance in the field circuit is changed. Thus, with these motors, a large speed variation can be obtained by means of field control without undue sparking at the brushes.

The type S. A. motor of the Canadian Westinghouse Co., Hamilton, is of this style. These motors are the same in design and construction as the Westinghouse type S motor, except for the addition of the auxiliary or interpoles. These poles are bolted to the frame midway between adjacent main poles. The coils are machine wound and are insulated in the usual way before being placed upon the poles; they are held in place by the auxiliary poles and the projecting tips of the main poles. The auxiliary poles and coils can be removed without in any way disturbing the main winding, by disconnecting the coil connections, withdrawing the bolts which hold the poles to the frame and sliding the poles and coils out in a direction parallel to the armature shaft.

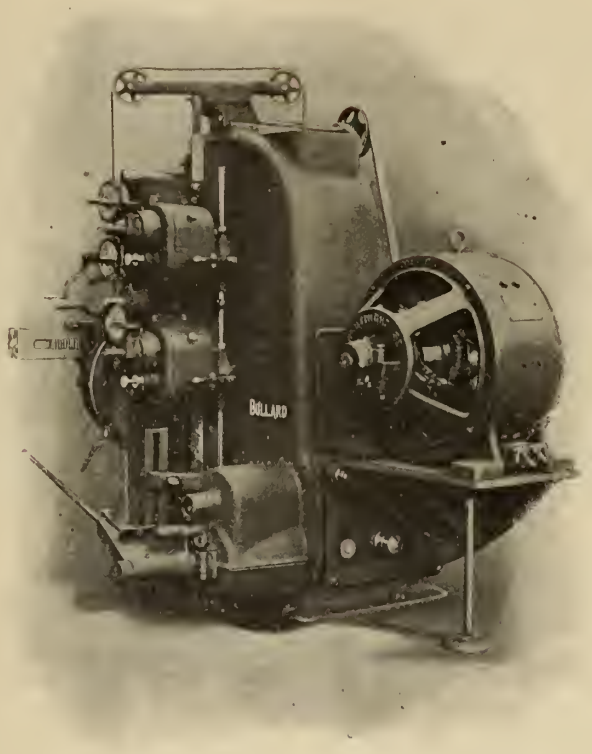
Since the winding of the auxiliary poles is in series with that of the armature, their magnetising effect will be proportional to the armature current. The arrangement of the poles is such as to apply the corrective influence of the auxiliary windings at the points where the distorting effect of the armature current is greatest, and this influence is directly opposed to that produced by the armature current. Thus the resultant field is made up of three components: that due to the shunt winding and proportional to its ampere turns; that due to armature reaction and proportional to the ampere turns of the armature winding, and that due to the auxiliary poles and proportional to the turns of the auxiliary coils. The field distortion produced by the armature reaction as the resistance in the shunt field current is changed is counteracted by the action of the auxiliary coils, and thus the resultant position of the magnetic field is maintained as formed by

Westinghouse Type S. A. Motor.



Lathe Equipped with Type S. A. Motor Showing Method of Remote Control.

the full field, no matter what the speed of the motor is within its limits, and consequently the motor will operate at full load at any speed within its range; and the auxiliary series windings give such control over commutation that the motor will carry momentarily fairly heavy overloads without serious sparking.



Vertical Turret Lathe Equipped with Type S. A. Motor.

The fields of the S A type of motor are made of cast iron yokes, with four inwardly projecting poles of laminated steel bolted to the frame. The field coils are machine formed and are interchangeable. The armature is of the slotted drum type, with laminated cores and machine-wound coils. The bearings are babbitt-lined and self-oiling. The controllers used for this type of motor are the drum type, the Westinghouse railway controller.

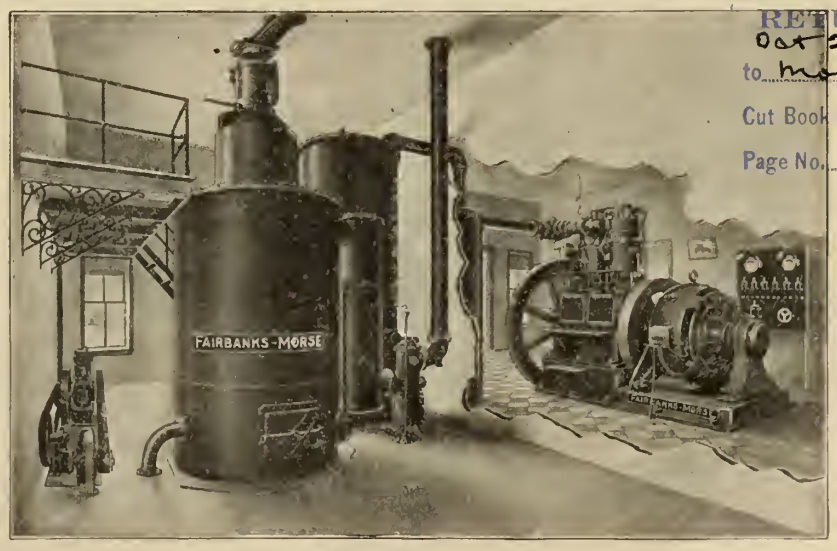
FAIRBANKS-MORSE GAS PRODUCING PLANT.

THE accompanying illustration gives a good idea of the appearance of the Fairbanks-Morse suction gas plant, representing the Fairbanks-Morse vertical producer gas engine direct connected to a Fairbanks-Morse dynamo. The Canadian Fairbanks Co., Limited, of Montreal, are installing a plant similar to this one in a large manufacturing establishment in Montreal. The producer itself will be of 100 h.p. capacity and will feed two 43 h.p. vertical producer gas engines, which will be directly connected to 30 k.w. generators. These in turn will operate motor-driven machines throughout this establishment and also furnish light for the plant. This represents a very neat layout lor a power plant, as will be seen by the description. There is a wall dividing the producer room from the engine room proper, and the coal is fed from an overhead hopper. An overhead gallery is easily reached by a stairway, and gives the operator in charge access to the top of the producer for the purpose of feeding in coal and poking the fire. Directly to the left of the producer is shown a Fairbanks-Morse 2 h.p. gasoline engine which is belted to an air pump and blower. This does away with the necessity of a hand blower for blowing the fires in the producer, and the air pump is used to fill an air tank, enabling the operator to start the engine by compressed air. In many cases these 2 h.p. gasoline engines are also used to operate a small elevator for carrying the coal to an overhead bin, and owing to the small quantity of coal consumed it is only necessary to operate this engine and elevator at long intervals.

The rapidly increasing cost of the various kinds of fuel, and the ever-present necessity for reduced cost of production have lead to the investigation of means for securing power upon a more economical basis than even the most modern steam plant or most highly efficient gasoline engine. The development of a satisfactory gas engine having been effected, a simple, inexpensive and reliable source of gas was sought for, and this has resulted in the use of producer gas plants of the "suction" type and "pressure" type.

Each type of producer has its advantages and limitations, but the suction type of producer is the more popular for supplying gas engines.

A suction producer is practically limited as to fuel to the use of either anthracite, charcoal or coke, because bituminous coal and all low grade fuels contain by-products which must be eliminated from the gas by mechanical processes; but the limitation of the suction producer as to the kind of fuel is offset by the advantages which that plant enjoys in comparison with the pressure producer. The advantages claimed for the suction producer over a pressure producer are



Fairbanks-Morse Gas Producer Plant.

RETURNED
Oct 23/06.
to Montreal
Cut Book No. 56
Page No. 65

briefly: Smaller cost of installation and less space occupied; higher efficiency because of the smaller amount of power consumed in bringing the gas from the producer through the cleaning processes to the engine; there being no steam under pressure, there is no danger from explosions; there is not the difficulty of regulating the supply; there is no danger of gas leakage because the gas is under less than atmospheric pressure nearly all the time.

The Fairbanks-Morse suction gas producer consists of the producer, the vaporizer, the scrubber and the gas receiver. The vaporizer is situated around the upper part of the producer, the steam being brought down to the base of the producer, and there mixed with the air before being drawn up through the bed of incandescent fuel. From the producer the gas passes through the trap or seal up through the scrubber. The scrubber contains coak which is sprayed from above.

The upright gas engine shown in the illustration of the installation is a four-cycle engine. The engine is governed by a special governor controlling the proportions of the fuel mixtures. The engine is of the enclosed, dust-proof type, but all parts are readily accessible. The frame is split transversely to facilitate handling, aligning and repairing. The main bearings are carried in the frame, and all bearings are adjustible for wear and alignment. The trunk pistons are of universal length and are provided with a special lubricating device. The pistons are accurately centred to equalize the wear on the cylinders. The valves and igniters are operated by single cam shafts. The engine is provided with an improved oiling system with graduated sight feed for each principal bearing, the oil being removed and filtered for re-use. The engine is started by compressed air. There is a carefully conducted shop test for load, regulation and efficiency before the engine leaves the factory.

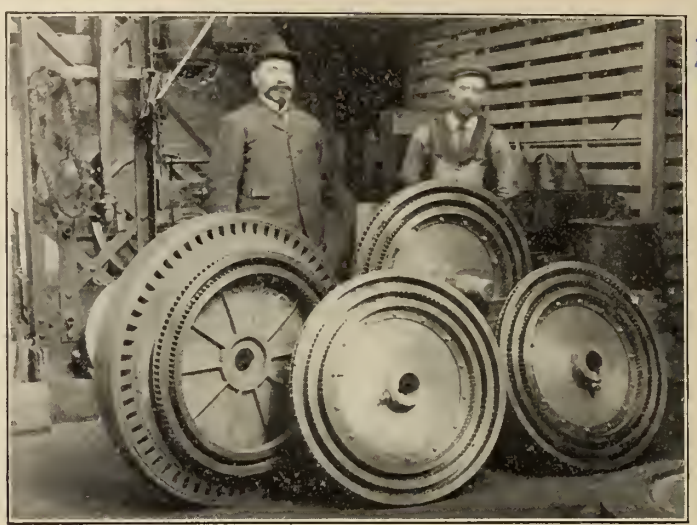


Fig. 1.—New Rotary Engine.

NEW ROTARY ENGINE.

STILL another rotary engine is being developed. A Montreal engineer, V. Filteau, has invented and patented a rotary engine, which has some new and interesting features. The inventor calls it a compound turbine engine. Figure 1 gives an outside view of the engine, and figure 2 is a sectional view.

The engine consists of a series of chambers, each chamber containing a piston device and means for connecting this device to the shaft, and the steam being supplied from one chamber to another through ports which increase in size or number as the steam progresses from one chamber to the next. The piston device consists of a disk (a) having a number of vanes or buckets (b) carried upon the periphery of the side next the exhaust end of the engine. Each of the piston wheels is keyed to the shaft. Any number of chambers may be used according to requirements, but the inventor says that an engine with twelve chambers appears to be the most satisfactory. The ports for the communication of steam are cut through the walls in the annular space between the vanes and the circumferential walls as shown at (c). These ports are placed at different points around the annular space, and as their number or size increases with each chamber towards the exhaust end of the engine, the steam will be admitted in greater volume to each successive chamber. Each of these ports is provided with a nozzle as shown in the sketch, which directs a jet of steam upon the buckets opposite each nozzle. The series of baffle plates (d) are to prevent the steam, after once having impinged upon the buckets, from again doing so from

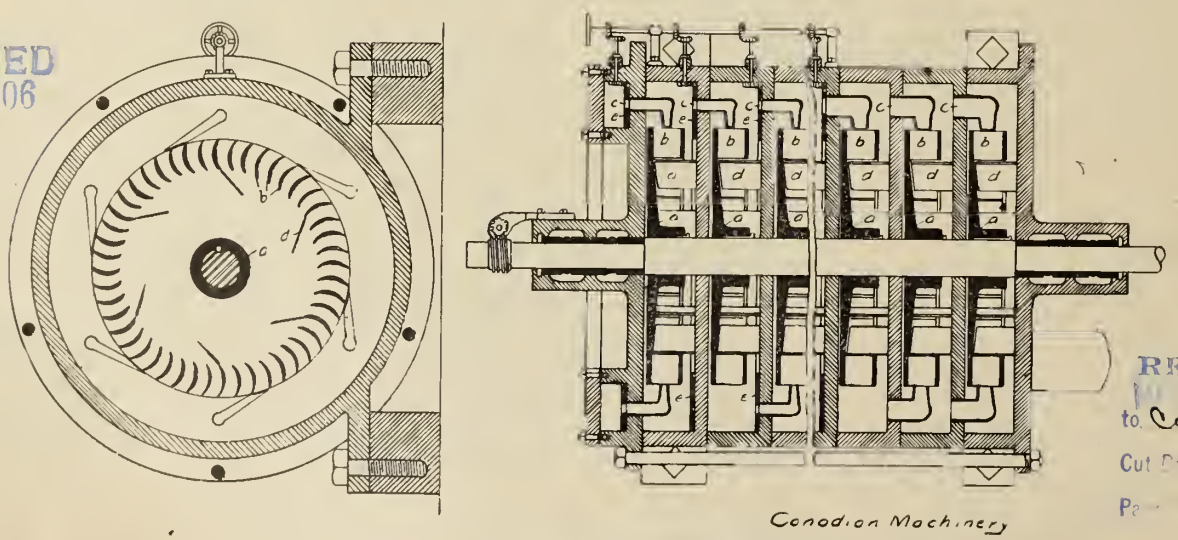

Fig. 2.—Sectional View New Rotary Engine.

the interior of the wheels. The exhaust port is situated in the last chamber of the series.

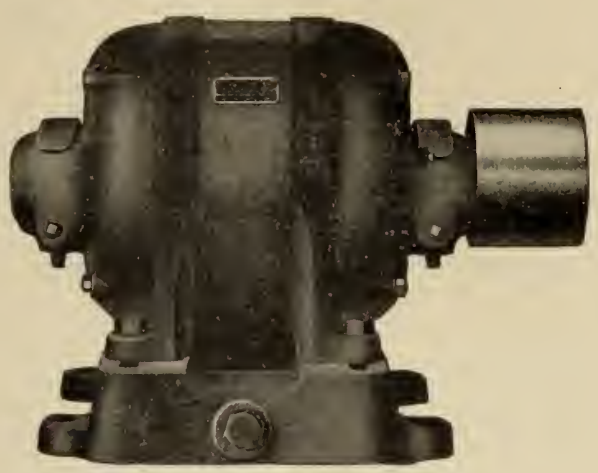
The engine is controlled by regulating the amount of port opening between the chambers, this being done by means of annular valve plates shown at (e), these plates being rotatively mounted upon the sides of the walls so as to be operated by the set of gears and rods as shown. The engine is governed by an automatic governor, which operates to close completely some of the ports, through the means before described, thus cutting off some of the steam jets and cutting down the power. This method of completely closing some of the ports instead of partially closing them all is adopted because in that way the efficiency of the engine is better maintained under varying load.

The radical difference between this turbine and well known types is in the compounding of cylinders. In the well known types of turbines the expansive qualities of the steam are utilized by compounding the cylinders, each successive cylinder being of greater capacity than the preceding one; whereas in this turbine each successive cylinder is the same size, the steam expanding through the increasing port opening area with each successive chamber.

STANLEY G. I. INDUCTION MOTORS

THE accompanying illustrations show an assembled view and a disassembled view of a new type of induction motor recently placed on the market by the Stanley G. I. Electric & Mfg. Co., Pittsfield, Mass. The distinctive feature of this type of induction motor is the dispensing with the cast iron frame which, in ordinary induction motors, completely surrounds the active part of the motor, consisting of laminated iron core and windings.

The method of supporting the active material in this type of motor is by means of end frames so arranged that the laminations are freely exposed to the air, thus allowing the heat to radiate with great dispatch. In the larger sizes the laminations are built up in sections, and for that reason the end frames are reinforced across the outer surface of the core by ribs to which the punchings are attached. But the smaller sizes are built up as shown in the assembled view of the motor. Here the



The Stanley G. I. Induction Motor.

end frames and the laminations are held together by means of a riveted construction, which leaves the laminated iron core freely exposed to the air around its entire periphery. This constitutes a rigid design.

In other respects there is nothing out of the ordinary in the construction of motor. The field windings consist of four wound coils, attention being paid to their proportioning so that when they are put in place there will be no undue strain upon the insulation. The field windings, after being placed in the slots, are thoroughly saturated with insulating compound, making them moisture proof and solidifying and unifying the windings, thus preventing injury to the insulation of individual wires in the windings.

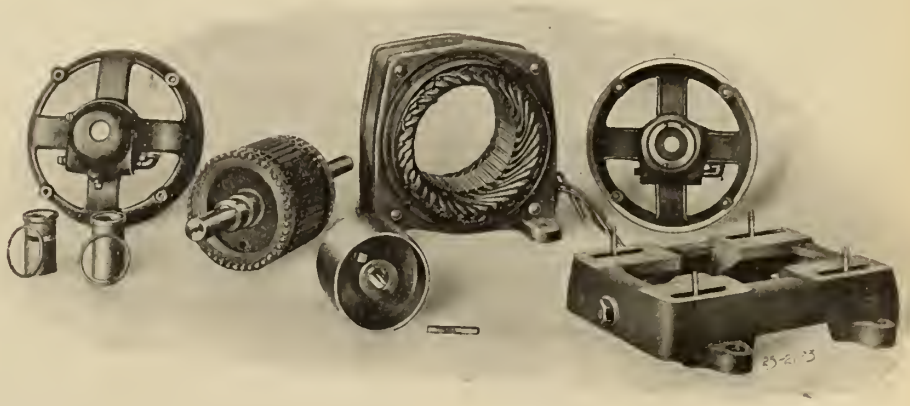
The end shields carrying the motor bearings are bolted to the end frames, which can be arranged to allow the motor to run on the floor, wall, or ceiling. They are also shaped so as to protect the ends of the coils. The bearings are self-aligning and are lubricated by the ring-oil method.

The rotor is of the usual squirrel cage type. The laminations are mounted directly on the shaft and held in position by a simple device. The conductor bars are placed in slots and are short-circuited with end rings, which rings are made up of several thin disks to facilitate the radiation of heat.

The chief advantages claimed for this style of design are improved ventilation and the curtailment of inactive material, thus securing smaller dimensions and lighter weight for a machine of the same power.

I. H. CO. MAKING GAS ENGINES.

The International Harvester Co., 7 F.F. Monroe street, Chicago, has but recently taken up the manufacture of gas and gasoline engines, and the reputation which the firm has acquired for its other lines of manufactures should be a warrant for the quality of the engine they are turning out. This company make a specialty of engines in the smaller sizes, and in these sizes the many good points of a gasoline engine will recommend them to the small power user. Some of these good points are: The readiness with which they may be started and stopped; they can furnish power at a moment's notice, and as soon as power is not required the engine can be shut down and all expense ceases.



Parts of Stanley G. I. Induction Motor.

The I.H.C. engines are adapted to use alcohol as fuel as well as gas and gasoline. The engines are made in various sizes in portable and stationary, horizontals and in verticals, thus adapting them for all classes of work.

The company are publishing an interesting booklet on the power question, which may be obtained from the International Harvester Co., 7 F.F. Monroe street, Chicago.

CORRESPONDENCE COLUMN

Canadian Patents.

Editor Canadian Machinery :—I would like to know what it would cost to take out a patent in Canada. I have a molding machine which I am getting covered here by patents, and wish to have it covered in Canada also. I wish you could get me some information concerning this.

JAS. F. WEBB.

Elkhart, Indiana.

(A simple invention can be patented in Canada for $45, the patent rights lasting six years. This $45 includes Government fees and patent attorney's fees. The inventor has only to supply the attorney with sketches or photographs of the invention and a description of it sufficiently explicit and in detail to allow the attorney to cover by the claims all points which the inventor wishes protected. By a simple invention is meant one which does not require very elaborate drawings to explain. In case the invention is very complicated, an additional fee may be charged by the attorney for the extra drafting involved. At the expiration of the first six years the government require another fee of $20 to protect the invention for a further period of six years.—Editor.)

* * *

Gas and Gasoline Engine Rating.

Editor Canadian Machinery :—We notice that there is some controversy in reference to the rating of gas and gasoline engines. We wish to say that in our plant at Galt we test all engines with a prony-brake and each engine is compelled to pull 20 per cent. more than its rating. We believe in giving more power than we claim we will, and therefore each and every engine that we ship out we guarantee will run successfully ten hours a day at 15 per cent. more than their rating. We are pleased to know that this subject has come up, and think that it will be good policy for the gas engine manufacturers in Canada to get together and agree to rate in no other way excepting by brake horse-power.

Iron Pyrites Mine in Hastings.

Editor Canadian Machinery : — Referring to your June issue, I am interested, as an expert in sulphite pulp making, to know where I can find the office or owners of the iron pyrites mine in Hastings County, from which ore there is made in Buffalo sulphuric acid. Where is the shipping place, and where is Hastings County ? I am a subscriber of Canadian Machinery and am willing to pay for postage expenses you may incur in getting the information. Kindly do your best for me in this matter.

"POSTOFFICE."

Ottawa, Ont.

(The owner of the iron pyrites mine in Hastings County referred to is the British America Development Co., Mail building, Toronto. All the ore is shipped by this company to the Contact Process Co., Buffalo, N.Y., who make the sulphuric acid. Hastings County is a county in Ontario situated on eastern extremity of Lake Ontario. Further information may be obtained from Mr. Cheesworth, manager of the British America Development Co.—Editor.)

* * *

Third Class Engineer Qualifications.

Editor Canadian Machinery :—Being a reader of your popular magazine, I would like to ask for some information as regards the qualifications of an engineer. I am a mechanic, age 22, well up in engine work, and have the theory of the management of boilers and power transmission machinery. What would be the best course for me to follow to obtain a third class certificate for engineer ? Any information you can supply concerning this will be appreciated.

W. A. WEEKS.

50 Richmond street, Montreal.

(By application to the chief engineer of the Board of Trade building, Montreal, may be obtained any information regarding the qualifications for an engineer. In the Ontario association the examination for the third class engineer's certificate is not at all severe, and in fact any person having had ordinary experience in engine running should very well answer all questions asked. A printed paper is submitted to the candidate, the questions on which must be answered in

THE MAN WHO SELLS.

WHAT means this prosperity? Sales. Sales necessitate transportation, which calls for power and vehicles. The results are felt in every part of the country. Sales light the furnace fires, blacken the sky with smoke, set machinery in motion, quicken the demands for labor, and spread the smile of plenty over the face of the land.

He who sells things is the apostle of happiness ; he is the bulwark of prosperity ; he fills the hotels ; he crowds the trains and he loads the freight cars with goods. The man who sells things is the best friend of everybody. He makes the people believe they need it; he is patient, tactful, broad-gauged, generous, good natured and tireless ; for him no whistle blows to sound the end of his daily toil ; for him there are but few peaceful evenings at his home fireside ; for him it is hustle, hustle, hustle ; he travels up and down the highways ; he seeks audience with and tells his tale to men of varying titles ; he runs the gauntlet of every conceivable degree of importance from the president to the office boy.

All honor to the man who sells things. Let us call him the commercial engineer. When he is not abroad in the land there is "nothing doing." His appearance foretells commercial activity, and just in proportion as he succeeds, the tide of prosperity ebbs and flows. The man who brusquely turns him down, or who affects to be bored by his presence, or who bars him from his office, does an injustice to the interests confided to his care, and also robs himself of a large amount of information that he needs in his business.—Geo. A. Post in "Graphite."

CONSOLIDATION OF FIRMS.

The Link Belt Machinery Co., Chicago, the Ewert Mfg. Co., Indianapolis, and the Link Belt Engineering Co., Philadelphia, have been consolidated into one company, to be known as the Link Belt Co., with headquarters at Chicago. The officers of the new company are : President, Charles Piez ; first vice-president, G. G. Howe; second vice-president, S. B. Beck; treasurer, S. Howard-Smith; secretary, Dyke Williams. The three plants will continue to be operated. The Chicago firm was organized in 1880, and two years later opened a branch in New York. The firm of Burr & Dodge, the Philadelphia representatives, were succeeded in 1888 by the Link Belt Engineering Co., and a new plant started at Mietown, four miles from Philadelphia. The Ewart Co. have been the manufacturers of the original link belting while the two link belt companies have operated along the same lines in the manufacture of conveying machinery.

ENGINEERING NEWS
AND SOCIETY NOTES

SOCIETY OFFICERS.

Canadian Mining Institute.

President, George R. Smith, Thetford Mines, Quebec; secretary, H. Mortimer Lamb, Victoria, B.C.; treasurer; J. Stevenson Brown, Montreal.

Toronto Branch A. I. E. E.

Chairman, R. G. Black; vice-chairman, K. L. Aitken, secretary, R. T. McKeen.

Marine Engineers.

Grand president, E. J. Henning, Toronto; grand secretary, Neil J. Morrison, St. John, N.B.

Canadian Electrical Association.

President, R. G. Black, Toronto; vice-presidents, R. S. Kelch, Montreal, W. R. Ryerson, Niagara Falls, Ont.; secretary-treasurer, T. S. Young, Confederation Life Building, Toronto.

Canadian Association of Stationary Engineers.

President, Joseph Ironsides, Hamilton; vice-president, Ed. Grandbois, Chatham; secretary, W. L. Outhwaite, Toronto.

Ontario Association of Stationary Engineers.

President, A. M. Wickens, Toronto; vice-president, W. A. Sweet; board of directors, W. Blackgrove, W. A. Sweet, A. M. Wickens and A. E. Edkins; treasurer and registrar to be appointed by board of directors.

Canadian Railway Club.

President, S. King; secretary, James Powell, chief draughtsman motive power department, G. T. R.; treasurer, S. S. Underwood, chief draughtsman car department, G. T. R.

Engineers' Club of Toronto.

President, F. L. Sommerville; treasurer, W. J. Bowers; secretary, Willis Chipman, Rooms 96 King St. W.

Canadian Society of Civil Engineers.

President, H. D. Lumsden, Ottawa; vice-presidents, M. J. Butler, Ottawa; C. B. Smith, Toronto; W. M. Walbank, Montreal; secretary-treasurer, C. H. McLeod. Rooms, 877 Dorchester street, Montreal.

Society of Chemical Industry

Chairman, Prof. W. H. Ellis; vice-chairmen, H. H. Van Der Linde, Milton; H. Hersey, A. McGill; hon.-secy., Alfred Burton, 44 York Street, Toronto.

Ontario Land Surveyors.

President, Otto J. Klotz, Ottawa; vice-pres., Thos. Fawcett, Niagara Falls; secy.-treas., Capt. Killaly Gamble, Toronto.

Engineers' Society, S.P.S., Toronto University.

President, K. A. McKenzie; vice-pres., B. J. McGugan, rec. secy., A. M. Damn; treas., G. E. Quance; cor. secy., A. E. Jupp.

CONVENTION OF C. A. S. E.

THE annual convention of the Canadian Association of Stationary Engineers was held in Galt on August 7, 8 and 9. Mayor Thomas, of Galt, opened the convention by an address of welcome to the delegates, to which A. M. Wickens, Toronto, made response. The morning and afternoon sessions of the first day were taken up by the president's address, the secretary's and treasurer's reports, and a discussion as to past presidents' privileges to act upon certain committees. During the afternoon and evening the delegates were entertained by a trip over the Galt, Preston and Hespeler Railroad to Hespeler, Preston and Berlin, and upon their return by a complimentary concert given by the Galt Kilties.

The paper on "The Engineer and his Boiler," read before the association on the second morning by A. M. Wickens, Toronto, was of considerable interest. The matter of the past presidents was again brought up, and after some lively discussion and the defeat of an amendment this resolution was passed, i.e., "that only immediate past presidents be entitled to a vote and the privileges of the association. In the afternoon a visit was paid to the large plant of the Goldie & McCulloch Co.; and in the evening a banquet was held at the Imperial Hotel.

The last day's session, as is usually the case, was a busy one, considerable new business being transacted as well as the election of officers. A committee was appointed to look after the organization of an official organ in the form of a monthly magazine which will be devoted to the work of the association.

The election of officers resulted as follows: president, Joseph Ironsides, Hamilton; vice-president, E. Grandbois, Chatham; secretary, W. L. Outhwaite, Toronto.

The convention will be held in Guelph next year.

CIVIL ENGINEERS' EXCURSION.

AN excursion on a somewhat large scale has been proposed by the Canadian Society of Civil Engineers, and will be carried into effect starting Saturday, Sept. 8, at 9.00 a.m. The Canadian Pacific Railway has placed a special train at the disposal of the society and it is expected that about 150 members will take part.

Going west it is proposed to visit Winnipeg, Calgary, Banff, Field, and Glacier, and to reach Vancouver about Sunday, 16th September. Such stay will be made at these places as will enable the party to carry out the various local programmes. If it is found to be practicable a special excursion to Victoria and Nanaimo will be arranged. Returning, the party will leave Vancouver on Wednesday, the 19th, go down the Arrow Lakes, and visit points of interest in the boundary country and the Crow's Nest district. The train will be sent around to meet the party at Kootenay Landing. On the return journey, the only important stop will be at Fort William, where the terminal facilities of the Canadian Pacific Railway will be inspected. The train will reach Montreal on Thursday evening or Friday morning, 28th of September.

The cars will be available for the use of the members during the entire excursion, except for the trip down the Arrow Lakes and the visit to the boundary district. In the interval between the completion of the lake trip and rejoining the train at Kootenay Landing, ordinary first-class coaches will be used, and the party will stop over night at hotels at Rossland, Grand Forks, and Nelson. The ordinary rates will be charged on Lake steamers and the hotel accommodation will be an extra charge.

ENGINEERS MEET AT CARDIFF.

THE British Institution of Mechanical Engineers held their convention at Cardiff, Wales, from July 30 to Aug. 3, 1906. Some of the American engineers who had attended the meeting of the Iron and Steel Institute in London were present at the convention. A number of interesting papers were read and discussed, among them being: "Blast Furnace Blowing Engines," "Some Notes on the Equipment of Collieries," "Manufacture of Tin Blasts," "Railway Motor Power Traffic."

ELECTRICAL UNITS AND STANDARDS.

The Imperial Government has called an international commission to meet in London in October to consider the subject of electrical units and standards. The Canadian Government has been asked to appoint a representative and Mr. Ormond Higman, chief of the Electrical Standard's Laboratory of the Inland Revenue Department, has been chosen.

NEW TREATMENT OF IRON ORE.

A new process of treating iron ore in the production of malleable iron and steel has been invented and tested in Australia. This process, the Heskett-Moore, is a continuous process, and it is claimed that a saving of 25 per cent. is effected in the manufacture of iron and steel by this process. It is also claimed that a smelting plant arranged for this process would cost less than one-fourth that of ordinary smelting plants. Patent rights for this process have been applied for throughout the world. The Department of Trade and Commerce, Ottawa, have a number of copies of a detailed description of this process, which will be available to those interested in the investigation of this process.

PERSONAL MENTION

Commissioner of Industries and Publicity.

A Department of Industries and Publicity has been established by the civic authorities of the City of Toronto. The council has finally recognized the importance of having the city advertised as an industrial centre, and of having a department at the City Hall which will be a general information bureau for manufacturers already established in the city and for manufacturers who are looking for sites. Mr. Jos. E. Thompson has been appointed Commissioner of Industries and Publicity, and the policy of the department has been left largely to his discretion. At present everything in connection with the department is in its primitive stages, and Mr. Thompson is in a receptive mood for information or

MR. JOS. E. THOMPSON,
Commissioner of Industries and Publicity, Toronto

suggestions which will be of use to him in the organization of his department and in the laying down of a definite policy to be followed in the conducting of the affairs of the department. Mr. Thompson has, however, formed a general policy, the details of which will have to be worked out gradually as conditions and circumstances suggest. This policy might be outlined thus: To advertise Toronto so as to bring before manufacturers and prospective manufacturers the natural and artificial features of the city which go to make it a good manufacturing centre; to interest as many manufacturers looking for sites as possible, but not to induce a manufacturer to leave the municipality he is located in to come to Toronto by offering special concessions; to form a bureau to which manufacturers in the city may take their grievances and requests, and from which these grievances and requests will be started through the proper channels in the civic government.

Mr. Thompson has been in the civic employ for some time in the city treasurer's department, and while in that department has won for himself many friends around the City Hall and throughout the city. Mr. Thompson has the hearty and genial manner which makes him a pleasant man to meet, and has the capacity of holding one's best attention even in ordinary conversation, and these qualities argue well for his making a qualified success of the new department. There is a decided need for such a department, and with a capable man at the head of it, the city should find it a paying investment. However, it is a department in which there will be a lot of work done of which the general public will never hear, and from which there may be no apparent results, and for that reason the commissioner of the department cannot reckon too much upon public apprcciation of his efforts, but must be satisfied, at least during the initial stages of the building of the department, with a personal realization of well-spent energies in the best interests of manufacturers and the city. Mr. Thompson deserves the support of the manufacturers and all others interested, and will appreciate greatly any interest taken in his department in the way of useful suggestions and letters of encouragement and support.

* * *

Death of Louis Cassier.

Among the victims of the appalling railway disaster on the London & Southwestern Railway near Salisbury, Eng., was Louis Cassier, founder of Cassier's Magazine, New York. Mr. Cassier was on one of his many trips from New York to London, and was one of those to leave the steamship New York to take the fast night express from Plymouth to London. As is known, the train left the track at Salisbury, resulting in the death of twenty-three passengers and the injury of many others. Besides founding and developing Cassier's Magazine, now so well known on this continent and in England, Mr. Cassier purchased the Electrical Age, the enterprise with which he inspired it accounting for the standing it now holds among electrical periodicals.

* * *

The Montreal office of Canadian Machinery was recently favored with a visit from Mr. Thos. Nopper, representing Canada machinery agency, who while there renewed a school boy acquaintanceship of thirty years ago. Mr. Nopper is a native of Western Ontario and a thoroughly practical man. He entered the selling end of the machinery business some time ago and has met with no small success.

* * *

New General Manager.

With the rapid industrial growth of Canada the younger men are coming more and more to the front, and assuming positions of responsibility formerly held only by those more advanced in years. This was demonstrated by the recent appointment of Mr. R. J. White to the general managership of the Frost & Wood Co., Ltd., Smith's Falls, Ont. Mr. White who has for some time past been assistant general manager, has been with the Frost & Wood Co. for the past sixteen years, during which time, by his

RETURNED
SEP 19 1908

R. J. WHITE,
General Manager Frost & Wood Co.

energy and executive ability, he has risen from post to post. In his present position he directs the affairs of one of the largest industrial concerns in Canada, and in this capacity has the best wishes of a large number of friends throughout the Dominion.

* * *

A Change all Around.

By a somewhat unusual coincidence three brothers, graduates in Science of McGill University, were appointed to new and much better positions during the course of a week. They are Messrs. A. A., G. Percy and L. Heber Cole, of Montreal, all being honor graduates from their alma mater.

Mr. A. A. Cole, for some years mining engineer and assayist of the War

Eagle and Centre Star mines, Rossland, B.C., has been appointed expert mining engineer to the Temiscaming and Northern Ontario Railway Commission, where his duties commenced on August 1st. This appointment is a recognition of Mr. Cole's high position in his profession. Mr. G. Percy Cole, who went to the United States to get the best experience obtainable in the electrical engineering field, and who has been assistant engineer to the Wagner Electric Mfg. Co. of St. Louis, is coming back to Canada, having engaged with Allis-Chalmers-Bullock, of Montreal, where he will act as assistant electrical engineer. After graduating last spring Mr. L. Heber Cole took up work at Victoria Mines, Ont., but recently was asked to go to Phoenix, B.C., where a position awaited him that would be welcomed by many graduates with several years' experience.

* * *

Mrs. Francis A. W. McIntosh, formerly advertising manager of the Standard Tool Company, Cleveland, O., and more recently connected with the advertising department of "Power," New York, now has charge of the publicity department of the Norton Company, Worcester, Mass., the appointment taking effect August 1.

Chas. H. Mitchell, C.E., Niagara Falls, Ont., late chief assistant engineer of the Ontario Power Co., has returned from an eight months tour through Europe, where he has been studying the many phases of hydro-electric power development in Central Europe. The absence of coal in Central European countries, especially Switzerland, and the many natural water powers, has occasioned the rapid advancement of hydro-electric power development. An idea of the cost of electro power in these countries can be obtained from the fact that in some localities where steam coal sells from $5 to $7 per ton, electric power can be obtained within 25 miles of the generating station in 500 horse power blocks of 24-hour power for from $25 to $35 per horse power per year.

A complimentary dinner was tendered Mr. Eugene Kibeler, at the Country Club, Dixie, Montreal, July 28, by the heads of the mechanical departments of Allis-Chalmers-Bullock, Limited, on the occasion of his leaving the employ of the company. Mr. Kibeler was formerly foreman of the machine shop, but left to accept a position in the west Allis shops of the Allis-Chalmers Co. in Milwaukee. After the dinner he was presented with a diamond pin and a purse of gold.

Cecil B. Smith has been engaged to superintend the construction of the Winnipeg civic power plant at a salary of $10,000 for two and a half years. He will be allowed to act as consulting engineer of the Ontario Power Commission for a period not exceeding three weeks each year.

Mr. R. I. Henderson, formerly secretary of the Henderson Roller Bearing Co., which was recently reorganized and an entirely new management appointed, is under arrest in Walkerton, Ont., in connection with charges of dishonest treatment by him of some of the original stock subscribers.

The firm of McLean & Sophus, who have been doing business as mechanical engineers and machinery experts at 301 St. James street, Montreal, for a little over a year, have dissolved partnership The St. James street business will be continued by Mr. McLean and associates under the firm name of W. B. McLean & Co. Mr. Sophus retains the agency for Schuchardt & Schutte, of New York, and W. T. Glover & Co., Manchester, England. He has opened an office and showroom at 13 St. John street, where he is already exhibiting a stock of split steel plate pulleys, Gronkoist drill chucks, leather shears, folding rules and high grade tools. A line which Mr. Sophus intends to push in this country is the "Vesta" cream separator, manufactured at the Swedish works of Schuchardt & Schutte.

INDUSTRIAL PROGRESS

MACHINERY AND MANUFACTURING NEWS would be pleased to receive from any authoritative source industrial news of any sort, the formation or incorporation of companies, establishment or enlargement of mills, factories or foundries, railway or mining news, etc. All such correspondence will be treated as confidential when desired.

E. J. Rodd will erect a two-storey machine shop in London.

Gourlay, Winter & Leeming will build a piano factory in Toronto.

The Forwell Foundry Co., of Berlin, will double the capacity of their plant.

Conrad Bros. have established a new planing mill at Lunenburg, N.S.

Randall & Greenshaw are going to erect a grist mill at Shoal Lake, Man.

The York & Sunbury Milling Co. are to erect a $20,000 saw mill at Gibson, N.B.

The Arcola Wood-working Co., of Arcola, Sask., are building a sash and door factory.

The Sisters of St. Joseph will build an infants' home in Toronto to cost $46,000.

E. C. Horn, of New York, has the contract for a $70,000 vaudeville theatre in Ottawa.

The Calgary Cement Co's plant has been destroyed by fire. The loss will be $100,000.

The Peterboro Steel Rolling Mills Co. have been looking for a site for a plant at Peterboro.

The grist mill of McCraken Bros., Tiverton, Ont., has been almost totally destroyed by fire.

The British Columbia Electric Railway Co. will build a branch sub-station at Ladnor, B.C.

The Goderich Lumber Company will rebuild their saw mill, which was destroyed by fire.

The Frontenac Gas Co. have acquired land in Quebec City for the erection of a large gas plant.

The Harmsworth pulp mills at Grand Falls, Newfoundland, were destroyed by fire. Loss $30,000.

J. P. Hall and E. C. Perry, two Americans, will establish a soap factory at Saskatoon, Sask.

A syndicate, headed by John A. Moore, of Seattle, will erect saw mills on Moresby Island, B.C.

The Wade Mfg. Co., Dundas, have commenced the manufacture of gold and silver plated novelties.

The Davis Dry Dock Co. have ordered a duplex pump from the Smart-Turner Machine Co., Hamilton.

The Sherwin-Williams Paint Co. have secured a two-acre site in Winnipeg for the erection of a factory.

The Sudbury Foundry Co. will in a short time be erecting their foundry building in Sudbury, Ont.

The Western Canada Cement & Coal Co. will erect a half million dollar cement plant at Exshaw, Alta.

The contract has been let for the building of the Listowel branch of the Guelph & Goderich Railway.

The Miramichi Lumber Co. are erecting a large new rossing mill at Chatham, to cost about $75,000.

The Quebec Gas Co. have ordered a coke crusher from the Smart-Turner Machine Co., Hamilton, Ont.

The False Creek Lumber Co., of Vancouver, will build a new saw mill near the city at a cost of $15,000.

The Canada Plate Glass Co. will erect a glass bending factory on Ashbridge's Bay land, Toronto.

The St. George Pulp & Paper Co., of St. George, N.B., had their mill destroyed by fire. Loss $25,000.

Battleford, Sask., citizens will vote on a by-law to expend $30,000 for installing a water works system.

Fire has damaged the paint warehouse of Sanderson, Pearcy & Co., Toronto, to the extent of $10,000.

The John Inglis Co., Toronto, have ordered a duplex pump from the Smart Turner Machine Co., Hamilton.

The Peterborough Steel Rolling Mills Co. are considering the claims of Peter-

borough, Port Hope, Cobourg and Lakefield as the site for rolling mills that will be established soon.

The J. B. Gateman Co's button factory was destroyed at Berlin. Loss $8,000 to $10,000, partially insured.

The Locomotive & Machine Co., Montreal have just completed a $1,600 steel pavilion at Lansdowne Park, Ottawa.

The Hamilton Bridge Works have ordered a standard duplex pump from the Smart-Turner Machine Co., Hamilton.

A large addition will be made to the Waterous Engine Works factory at Brantford by about 4,000 square feet area.

Work has been begun on the construction of the Clergue Railway, the Manitoulin & North Shore, on Goat Island.

John. Fell Mills, of Buffalo, is negotiating with Welland, Ont., with a view to establishing an automobile factory there.

Fire damaged the pulp mills being erected at Grand Falls, N.S., by Sir Alfred Harmsworth, to the extent of $30,000.

Randall & Greenshaw, Shoal Lake, Man., ask the municipality for a loan of $15,000 to build a grist mill and elevator.

The Fairgrieve Co., Toronto, are being supplied with a duplex pump, built by the Smart-Turner Machine Co., Hamilton.

The Cannon Granite Co. have ordered a 10-ton hand-power traveling crane from the Smart-Turner Machine Co., Hamilton.

The comb and novelty works of J. B. Gettman, Berlin, Ont., have been destroyed by fire. The loss will amount to $8,000.

The J. Coulter Co. have purchased a site on Lombard street, Toronto, for $15,000, and will erect a jewelry case factory on the site.

The Smart-Turner Machine Co., Hamilton, are supplying the Port Arthur Sand, Lime & Brick Co. with a standard duplex pump.

The Toronto, Hamilton & Buffalo Railway are making arrangements to enlarge and improve their railway yards in Brantford.

W. J. Holliday, Gananoque, Ont., is reported to be starting the manufacture of a brand of leather not at present made in Canada.

The Smart-Turner Machine Co., Hamilton, are supplying the Lake Simcoe Dredging Co. with a duplex, outside packed, plunger pump.

The Fred. Armstrong Co., Toronto, have ordered an automatic feed pump and receiver from the Smart-Turner Machine Co., Hamilton.

Negotiations are in progress whereby the Detroit United Railway will purchase the franchise of the Windsor and Tecumseh Electric Railway.

A Pennsylvania steel forge company is negotiating with Toronto civic officials for a two acre foundry site on Royce avenue. Fifty men will be employed if the industry is established.

The Town of Napanee, are installing a Smart-Turner independent jet condenser and duplex boiler feed pump in their electric lighting plant.

Alderman J. G. Watson, of Calgary has purchased a site for a stone cutting establishment for which he is now in the east purchasing machinery.

A large saw mill with a capacity of 100,000 feet per day, will be erected at Cumshqua Inlet, B.C., by a syndicate headed by John Moore, Seattle.

The Smart-Turner Machine Co., Hamilton, have received an order for a side suction centrifugal pump, from Messrs. C. Winger & Son, Springvale, Ont.

The Smart-Turner Machine Co., Hamilton, have received an order from the Amherst Malleable Iron Works, Amherst, N.S., for ten tumbling barrels.

The Havelock Electric Light Co. installed another water wheel in their powerhouse last week thereby increasing their plant to the extent of 300 h.p.

Crozier & Elliott, representing the Adjustable Boiler Flue Co., are negotiating with Portage la Prairie with a view to establishing a factory in that place.

Orillia's water works and lighting plant last year made a clear profit of over $2,500, after providing for principal and interest on debentures totalling $318,824.

Southampton ratepayers voted by-laws to lend $15,000 to a furniture company, $10,000 to Sol Knetchel for a machine shop; $5,000 to Chas. Williams for a grist mill.

The Huron & Ontario Electric Railway Co. propose to run their electric line from a point on Lake Ontario to Sarnia, via Beeton, Flesherton, Owen Sound and Goderich.

The planing mill and residence of Mustard Bros., at Websterville, Ont., were burned to the ground together with a large quantity of lumber. The loss is estimated at $12,000 with insurance of $6,000.

The Steel Fence Post Co., of Toronto, has been granted an Ontario charter to manufacture all kinds of wire fencing material and machinery. The directors are H. Buckel and T. Patterson, all of Toronto.

The Smart-Turner Machine Co., Hamilton, have received an order from the Corporation of Port Elgin for their water works pumps, consisting of a compound duplex engine, a boiler feed pump, piping, etc.

The Hamilton & Brantford Electric Railway Co. have contracted with the Dominion Steel Co. for steel rails to be used from Hamilton to Brantford. The contract amounts to [illegible]. eighty-pound rails will be used.

A large deposit of rich iron ore has been discovered south of Verner in the Nipissing district by W. A. Cockburn, Sturgeon Falls. The ore is present in great surface quantity and in a locality convenient to the railway.

Donald Fraser & Sons have decided to rebuild the Aberdeen planing mill at Fredericton, N.B., which was destroyed by fire some time ago. The mill will be equipped especially with machinery for making clapboards, etc.

The Dominion Carriage Co. will build a $60,000 factory in Toronto Junction, instead of in Toronto, because the structural steel in the building was judged too light to comply with the building regulations of the city.

A dynamite manufactory is to be erected on the shores of Burrard Inlet, not many miles from Vancouver. A company of local business men has been formed with R. P. McLennan at its head, which will establish the new industry.

The Golley & Finley Iron Works, Leamington, Ont., have the installation of their machinery about completed, and they will soon be in a position to do all kinds of machine and foundry work. J. J. Hartigan is plant superintendent.

The woodworking factory of Mattinson & Son, Thompson Station, near Amherst, N.S., has been destroyed by fire, causing damage to the extent of $14,000, there being very little insurance. It is not probable that the plant will be rebuilt.

The first open hearth furnace and first blooming mill and combined rod and merchant mill in the vicinity of Montreal will shortly be erected in connection with the Dominion Wire Manufacturing Co. and will cost about half a million dollars.

It is stated that Canada will excell all countries, with the exception of England, in its representation of natural products and manufactured goods at the New Zealand International Exhibition, to be opened at Christchurch, New Zealand, on Nov. 1.

The new buildings of the Alberta Portland Cement Co., Calgary, together with the machinery installed have been burned. The work of rebuilding will be commenced at once. The loss is estimated at from $75,000 to $100,000, with insurance at about $28,000.

A dry kiln, with a capacity of 25,000 feet, has recently been added to the saw mill and planing mill plant of A. McDonald, Peterborough, by the McEachern Heating & Ventilating Co., boiler and engine have recently been added to the equipment.

It is said that a well-known Pittsburg Co. intends going into the electric smelting industry in Canada at some point where power can be obtained at minimum rates. Plans are also being laid for the establishment of electric smelters in Mexico and the United States.

A new stove foundry is to be established at Dorchester, N.B., under the management of Wm. Dowd and H. R. Ficks, formerly of Moncton, but more recently of the United States. The site has been procured and three foundry buildings are now being erected.

The Canadian Pacific Railway Co. have placed orders at their Angus shops for increased passenger equipment, including 20 coaches, 10 baggage and express cars, and 25 box baggage cars.

Messrs. Beatty, shipbuilders, Welland, Ont., have just completed a dredge for the Canadian Dredging & Construction Co., and they have another dredge under construction. Messrs. Beatty will soon be installed in their new works, where the facilities for work will be doubled.

The Oster File Co., of Hamilton, have recently completed a new factory on the corner of Bay and Strachan streets. This step was necessary on account of growing business, making the former quarters too small. A new equipment of machinery for file cutting has been installed.

Woodstock, Ont., will on Sept. 12, submit a by-law providing for a loan of $25,000 to the Canadian Bearings Co., of Hamilton. The company agree to erect three buildings at an expenditure of $10,000, and to install machinery worth $30,000. They will employ at least fifty men.

The Central Foundry Co., an American firm, have decided to locate in Port Hope, the town offering exemption from taxation, with the exception of school taxes. The company are refitting an old radiator plant, and expect to commence manufacturing in a couple of months.

The British Columbia Marine Railway Co., of Esquimalt, has been given the contract by the Dominion Government for the hydrographic steamer to be used on the Pacific. The price is $143,000. The Victoria Machinery Co. tendered at $191,000 and the Polson Iron Works at $202,000.

Steps are being taken towards the fulfillment of the plans of the Shipbuilding Investment Co., Halifax, N.S., for the establishing of a shipbuilding yards at Dartsmouth. Swan & Hunter, the large shipbuilding firm at Wallsend-on-Tyne, Eng., have a controlling interest in the Shipbuilding Investment Co.

The British Columbia Copper Co. has received one of the three mammoth furnaces which it is installing at the smelting works, and it is now on its foundations. The other two will follow soon from Milwaukee, where they are being manufactured. The improvements at smelter and mines will cost about $400,000.

The Montreal Motor Co., Limited, have leased quarters in Montreal, where they will manufacture automobiles. The entire automobile will not be manufactured in Montreal, but the plant will be chiefly for assembling. The engine used will probably be a French one, and the rest of the car will be English.

The Woodstock city council is negotiating with the Canada Furniture Manufacturers, which company purposes to establish at Woodstock a large furniture manufacturing plant, at which from 300 to 600 men will be employed. The city is asked to provide for the loan and the matter will be referred to the ratepayers at an early date.

The British Columbia Power Co., Limited, Vancouver, B. C., have commenced the erection of a dynamite mill on Burrard Inlet, where dynamite will be made which will be different from anything at present on the Canadian market. In the manufacture of the dynamite, nitro glycerine is used with silicate of aluminum as absorbent.

The Canadian Buffalo Forge Co., Montreal, have just completed an installation of down draft forges for the Northern Electric Co., Montreal. This equipment consists of forges with cast iron hoods through which gases are drawn by a suction fan. The forge shop is by this method kept as free from gases as any other of the work shops.

A company who will manufacture stoves, heaters, ranges, etc., has been organized in Owen Sound with a capital stock of $200,000. Allan J. Ross, hardwareman of Owen Sound, will be general manager, and W. S. Hampden, Toronto, superintendent of works. Different improvements and patents are held by the company, which it is said will materially reduce the amount of fuel used.

Allis - Chalmers - Bullock, Limited, Montreal, have been awarded the contract for the electric and hydraulic machinery for the new power house of the Quebec Railway, Light & Power Co., Quebec, which is to be situated one-half mile above Montmorency, on the St. Lawrence River. The power house equipment will consist of a 2,225 h.p. turbine water wheel and a 1,500 k.w. A.C. generator.

W. W. Murray, of the Majestic Wire Fencing Co., a Michigan concern, has been making a trip through Western Canada and has decided to establish factories at Winnipeg and Edmonton for the manufacture of wire fabric for concrete reinforcement, and all kinds of farm and lawn fencing. Mr. Murray expects to have his factories in operation this Fall, and to employ at least 100 men.

Armstrong Bros.' Tool Co., "The Tool Holder People," of Chicago, have just shipped two orders received recently from the Isthmian Canal Commission, aggregating almost one thousand Armstrong tool holders, many heavy sizes being included. They have also received recently an order for universal ratchets for use in the Canal zone. Many smaller shipments had preceded these later and larger oders.

The preliminary arrangements for the Electrical Trades Exposition in the Fall of 1907 were made at a meeting of Montreal firms interested in the proposition, which took place this week. Five thousand dollars, a sum larger than will be required for the preliminary work, has already been subscribed. At the exposition there will be exhibits of all electrical apparatus, as well as that of allied trades.

Sturgeon Falls, Ont., has secured the works of the North Ontario Reduction & Refining Co., which has been organized with a capital stock of $500,000, to provide for the Cobalt and Sudbury districts the smelting reduction and refining works so necessary for that part of the country. It will no longer be necessary to export the ore, and thus the mine owner will save not only his freight charges, but also the valuable by-products.

The Canadian Pacific Railway have in view the running of a line of steamers between Fort William and Goderich, and already contracts have been let for the reclaiming of several acres of Lake Huron for the construction of docks. A large grain elevator will be constructed on the docks, and it is expected that there will be traffic over the steamboat line and over the new C.P.R. between Goderich and Guelph within a very short time.

The Montreal office of the Canadian Westinghouse Co. has had a busy Summer, among the recent installations made by them being a k.w. turbo-generator at the Montreal Light, Heat & Power Co's Queen street station, a switchboard at the Westmount incinerator plant and a four panel switchboard at the Saraguay Electric Light & Power Co's plant, Cartierville. They are also putting in all the electrical equipment for the Soulanges Canal.

There is great difficulty experienced in getting bolts and nuts just now. Factories are rushed to their fullest extent and have contracts for months ahead. The demand has become so large that firms who have heretofore depended upon Canadian manufacturers for their supply now find it impossible to make contracts for anything like early delivery, and have had to place contracts with British firms. All this, of course, tends to firm up prices, and it would not be surprising to see a further advance before long.

The Quebec Railway Light & Power Co., finding that its power from Montmorency Falls proves inadequate at certain times, has entered on an extensive development about half a mile higher up the river. To provide for the season of low water the company has erected there, according to the plans of E. A. Evans, chief engineer and general manager, a dam 84 feet high, the highest in Canada, for such a purpose. It is 67 feet 4 inches wide at the base and 12 feet wide at the crest and will hold back 52,000,000 cubic feet of water.

The firm of Brown, Boveri & Co., Limited, electrical engineers and contractors, Baden, Switzerland, are establishing a branch company in London, Eng., of the same name, to look after the interests of the parent firm in Great Britain, Canada, and other colonies. This company will take over the contracting business of Whiting, Eborall & Co., London, and Mr. A. C. Eborall will be managing director of the new firm. The English Brown, Boveri & Co. will have the whole of the resources and experience of the Swiss company behind it, which firm is now a concern with a capital of £640,000, having works in Baden, Mannheim, Paris, Christiana and Milan.

Companies Incorporated

The Renwick Co., Limited, Toronto; capital, $40,000; purpose, to build and operate steam vessels. Directors are: A. W. McKenzie, D. B. Hanna, L. W. Mitchell, all of Toronto.

Sydney Steamship Co., Sydney; capital, $40,000; purpose, to build and operate steam vessels. Directors are: R. Harrington, J. A. Young, H. C. Harrington, all of Sydney.

The Multi Scale Co., Limited, Guelph; capital, $40,000; purpose, to manufacture scales, known as Multi Scales. Directors are: H. Wright, Geo. Henderson, David Anderson, all of Guelph.

Alfred Prendergast, Limited, Montreal; capital, $20,000; purpose, to manufacture and deal in clothing. Directors are: Alfred Prendergast, S. Munroe and A. Paulin, all of Montreal.

Monarch Motor Co., Limited, Montreal; capital, $250,000; purpose, to manufacture and repair automobiles. Directors are: L. D. Robertson, J. S. Mackenzie, J. D. Warrington, all of Montreal.

The St. Lawrence Canadian Navigation Co., Limited, Montreal; capital, $1,000,000; purpose, to build and operate steam vessels. Directors are: Wm. Paul, L. Lacouture and Jos. Jean, all of Montreal.

Hunt Bros., Limited, London, Ont.; capital, $145,000; purpose, to carry on a general flour and grain milling business. Directors are: C. B. Hunt, J. I. A. Hunt, C. R. Hunt, and G. E. Hunt, all of London.

The Saunderson Mfg. Co., Limited, Sydney; capital, $45,000; purpose, to manufacture and deal in all kinds of roofing material. Directors are: A. E. Collas, A. A. Saunderson, A. L. Melvin, all of Halifax.

The Canada West Coal & Coke Co., Limited, Winnipeg; capital, $2,000,000; purpose, to carry on a mining business. Directors are: J. S. Hough, A. C. Ferguson, C. Williams, and Max Finklestein, all of Winnipeg.

The Arundel Lumber Co., Ottawa; capital, $100,000; purpose, to carry on a lumbering business throughout Canada. Directors are: G. H. Perley, W. G. White, C. E. Read, and F. W. Avery, all of Ottawa.

The Dominion Portland Cement Co., Limited, Montreal; capital, $1,000,000; purpose, to manufacture and deal in cement. Directors are: Henry Domville, J. H. Redpath and H. E. Borradaille, all of Montreal.

The Lamb-Watson Lumber Co., Winnipeg; capital, $800,000; purpose, to carry on a general lumbering business. Directors are: C. R. Lamb, Minneapolis; Otto Lachmund, Arrowhead, B.C.; G. D. Minty, Winnipeg.

British Columbia Timbers, Limited, Montreal; capital, $100,000; purpose, to carry on a general lumbering business throughout Canada. Directors are: A. L. MacLaurin, G. A. Forbes, R. H. Fulton, all of Montreal.

Dominion Carriage Co., Limited, Toronto; capital, $50,000; purpose, to carry on a general carriage manufacturing business. Directors are: Henry Horsman, Toronto; A. G. Horose, London, and J. D. Dort, Flint, Mich.

The Read Timber & Lumber Co., Ottawa; capital, $1,000,000; purpose, to carry on in Canada the business of lumbering. Directors are: C. E. Read, W. G. White, G. H. Berley, F. W. Avery, and Wm. Anderson, all of Ottawa.

Ottawa Pulp & Paper Co., Limited, Ottawa; capital, $25,000; purpose, to manufacture and deal in ground wood pulp, sulphite pulp, paper, cardboard, etc. Directors are: Douglas Armour, V. E. Mitchell, E. T. Surveyer, all of Montreal.

Henry Morgan & Co., Limited, Montreal; capital, $3,000,000; purpose, to manufacture and deal in all kinds of mechanical devices, machinery. Directors are: James Morgan, Montreal; C. D. Morgan, Maisonneuve, and H. M. Morgan, Montreal.

The Canadian Converters' Co., Limited, Montreal; capital, $3,000,000; purpose, to manufacture and deal in all kinds of linen, woolen, cotton, silk or other textile goods. Directors are: A. H. Sims, J. P. Black, G. H. Harrower, all of Montreal.

Berlin Machine Works of Canada, Limited, Hamilton; capital, $500,000; purpose, to manufacture and deal in all kinds of machinery. Directors are: P. B. Yates, L. D. Forbes, F. L. Lane, all of Beloit, Mich.; John Patterson and S. D. Biggar, Hamilton, Ont.

Maple City Oil & Gas Co., Chatham; capital, $40,000; purpose, to prospect for oil and gas and to develop oil and gas finds. Directors are: T. K. Homes, James Innes, A. D. Chaplin, G. W. Cowan, Jas. Simon, W. E. Rispin and M. Egan, all of Chatham, Ont.

The St. Lawrence & Great Lakes Dredging & Wrecking Co., Limited, Montreal; capital, $350,000; purpose, to manufacture and operate dredging plants and dredges. Directors are: H. W. Prendergast, Montreal; W. J. McWhinney and E. P. Brown, both of Toronto.

Allith Mfg. Co. has been incorporated under Ontario charter with a capital stock of $40,000, for the purpose of manufacturing door hangers, hardware specialties, etc. The provisional directors are J. D. Spence, G. A. Walker and J. F. McKee, with head office at Hamilton.

The Canada Metal Co., Toronto, have been granted an Ontario charter with a capitalization of $100,000 to manufacture and deal in metals, and aequire the business carried on by Wm. G. Harris under the name of the Canada Metal Co. The directors are A. G. Harris, F. Harris and W. G. Harris, jr.

New Idea Buckle Co. has been incorporated under Ontario charter with a capital of $60,000, for the purpose of manufacturing all kinds of buckles and lines of hardware. The provisional directors are T. J. McKeown, H. Siemens, B. R. Hawley, R. S. Beaver and Rhoda B. Hall, with head office in Toronto.

The Canada West Coke & Coal Company have been incorporated under Dominion charter with a capital stock of $2,000,000 for the purpose of mining and dealing in coal, oil and metals. The provisional directors are J. S. Hough, A. C. Ferguson, Chas. Williams, Max Finklestein and W. M. Graham, with chief place of business at Winnipeg.

The Page-Hersey Tube & Lead Co., Guelph, has been granted an Ontario charter with a capitalization of $2,000,000 to take over the business of the Page-Hersey Iron & Tube Co., and manufacture and deal in all kinds of metals. The directors are S. P. Grosch, R. C. Donald and T. A. E. World, all of Toronto.

The Dominion Portland Cement Co. have been incorporated under Dominion charter with a capital stock of $1,000,000 for the purpose of manufacturing cement and by-products. The provisional directors are Henry Dornville, J. H. Redpath, H. E. Borradaille, H. N. Chauvin and C. A. Duclos, with chief place of business at Montreal.

St. Canut Lumber, Light & Power Co., Limited, St. Canut, Que.; capital, $250,000; purpose, to manufacture lumber and make furniture, doors, sashes, shingles, etc., and to carry on the business of an electric light, heat and power company. Directors are: S. A. D. Sabourin, E. F. Surveyer, J. N. Weldon, and S. J. LeHuray, all of Montreal.

The Desmarteau Plumbers' Supply Company have been incorporated under Dominion charter with a capital stock of $195,000 for the purpose of manufacturing and dealing in plumbers', tinsmiths' and ironmongers' supplies. The provisional directors are J. A. Desmarteau, H. Hebert, P. Bilaudeau, H. Hamel and J. B. Robert, with chief place of business at Montreal.

The Leclare Lumber Mills, Limited, St. Bonaventure, Que.; capital, $145,000; purpose, to manufacture lumber and carry on a general lumbering business. Directors are: J. L. B. Leclare, Sorel, Que.; A. Daigle, St. Moise, Que.; and J. F. Bugeauld, St. Bonaventure.

The Ambwisen Hydraulic Construction Co., of Canada, Limited, Montreal; capital, $100,000; purpose, to carry on a contracting business in the line of water power development and dredging of all kinds. Directors are: D. S. Walker, R. S. Lea, E. Bradshaw, all of Montreal; W. L. Church, Newton, Mass.; and C. H. Eglee, Brookline.

The Stave Lake Power Co. are building a large dam on Stave River, British Columbia, where an electrical generating station will be built to develop 40,000 h.p. The dam will be 47 feet in height.

TO ELECTRICAL ENGINEERS.

ONE of the oldest European electrical manufacturing companies, having five works in different countries, and whose name, exceptiona reputation and experience are known throughout the engineering circles of the world, is desirous of appointing representatives in British North America. It is considered that responsible agents with sound technical knowledge and used to big undertakings can undoubtedly handle its leading lines with success, notwithstanding the existing competition from Canadian firms. Applications emanating from well-established engineering firms, having branch offices in the different cities of Canada, will alone be considered. Replies to be addressed to Box 49, CANADIAN MACHINERY, Toronto. [9]

TECHNICAL BOOKS.

BOOKS for Engineers, Mechanics, Draughtsmen, etc. Send address for our latest catalogue of practical, up-to-date works, forwarded post free to any address. Technical Publishing Co., Ltd., 287 Deansgate, Manchester, England. [9]

BUSINESS CHANCES

INDUCEMENTS SOUGHT—A firm employing over a hundred hands, would like to get full particulars of inducements offered by Canadian towns and cities to branch of reliable and well established concern. Reply to Manufacturer, c/o CANADIAN MACHINERY, Toronto. [8]

PROPERTY FOR SALE

FACTORY site or subdividing property; 26 acres or 200 lots; in Industrial St. Catharines; clean, level, dry, square block; inside city; water and rail facilities; electric line passes property; cheap electric power and natural gas; exemptions, best labor conditions; bargain; W. B. Clark, trustee, Port Dalhousie, Ontario. [8]

SITUATIONS VACANT

TECHNICAL men's league, Tacoma, Washington, requires a number of talented men for members, to fill high-salaried office and technical positions in Pacific coast cities.

WANTED — Capable young man with fair knowledge of mechanics, and good appearance as city traveller in Winnipeg. Good position for right man. Box 57 CANADIAN MACHINERY, 511 Union Bank Building, Winnipeg.

FOR SALE.

SASH and door factory, running every day; situated on the O. and N.Y. Railroad, twenty miles from Ottawa. For further particulars enquire W. C. Millar, Russell, Ont. (9)

ELECTRIC light plant for sale—Steam power; thriving town; Eastern Ontario A snap if sold quick. Address J. G. Delong. lock box 120, Elgin, Ontario. (9)

ONE 50-horsepower Westinghouse motor—wired for alternating current; two transformers and starter; will be sold cheap, owners now using steam power. Apply Tait-Carss Lumber Co., Orillia, Ont.

FOR SALE

"LITTLE GIANT" turbine water wheels, machine-cut wood and iron tooth gearing; power transmission machinery orders executed with despatch; get catalogue and prices. J. C. Wilson & Co., Glenora, Ont.

150 HORSEPOWER Heine boiler—in first-class condition; also pump, shafting, belting, pulleys, heater, etc.; all used by the Canada Biscuit Company; for sale by Smith, Baggs & Heaven, corner King and Bathurst streets, Toronto, who are now the owners of the property, and do not require power.

PEERLESS self-oiling engine — 15" x 14"—150 h.p. at 250 revolutions per minute; automatic governor; balanced valve; pulley 66"x 14" c.f.; extended subbase for direct connection to 100-k.w. generator, 5" steam pipe, 6" exhaust; run only for a short time; in first-class condition. Belleville Portland Cement Co., Ltd., Belleville, Ont.

WHEELOCK engine—11 x 28—sailor governor; flywheel pulley; now running; reason for selling, putting in larger; a bargain. Jos. Knox & Co., Stayner.

Deseronto Iron Co.

LIMITED

DESERONTO, ONT.

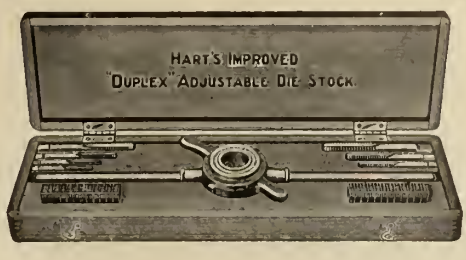
Manufacturers of

CHARCOAL PIG IRON

BRAND "DESERONTO."

Especially adapted for Car Wheels, Malleable Castings, Boiler Tubes, Engine Cylinders, Hydraulic and other Machinery where great strength is required; Strong, High Silicon Iron, for Foundry Purposes.

A THREADING OUTFIT



THAT is suitable for general shop use—the "DUPLEX" BOLT DIE STOCK SET "A," range ¼ to ¾ in. It contains dies that adjust without a wrench, and require no reversing when cut is finished. A variety of sets with desirable ranges.

—MANUFACTURED BY—

THE HART MFG. CO., 25 WOOD STREET, CLEVELAND, OHIO, U.S.A.

A Wealth of Information

is contained in the catalogues of our advertisers. Much of this is of the greatest value.

Get the Habit

of dropping a post card to the different firms for their catalogues. It will help you more than you imagine. It will be the means of your getting in touch with them and establishing a relationship that will probably mean business in the future or right away. It takes but a minute to write a card. Your enquiries will receive careful attention.

CANADIAN MACHINERY & MANUFACTURING NEWS,
TORONTO

Moreau Pulp Wood Barker

for peeling soft or hard wood of all dimensions from 3 inches up, and all lengths from 36 inches up.

Can be run the year round in dry, green or frozen wood.

Capacity, 3 cords per hour, with 2 men and 6 horse power.

Good Agents Wanted for Canada and U.S.A.

C. MANSEAU, MITCHELL STATION, P. Q.

Sole Selling Agent for The Moreau Barking Machine Co. for Canada and the U.S.A.

"Redstone"

High Pressure

Sheet Packing

A packing that will hold. For use in highest pressures for steam, hot or cold water and air. Packs equally well for all.

From actual tests, we believe that this packing is the most durable and satisfactory of any on the market. Try a sample lot and see for yourself.

Manufactured Solely by

THE GUTTA PERCHA & RUBBER MFG. CO. of TORONTO, LIMITED

HEAD OFFICES,
47 Yonge Street, Toronto.
Branches: Montreal, Winnipeg, Vancouver.

If You Desire all The Good Things of Current Literature Between Two Covers You'll be Interested in What is Said Below.

As the number of magazines increases the **more** difficult it becomes for you to secure a representative selection of articles, i.e. if you subscribe **for** individual magazines.

As the number of magazines increase the **less** difficult it becomes for you to secure a representative selection of articles, i.e. if you subscribe **for**

The Busy Man's Magazine

This magazine is an epitome of the world's best thought **today.** It contains the very selections you want to see but have no time to look for in individual magazines.

In addition there is an alphabetical index of magazine articles for the month.

For the sum of $1.50 any subscriber to Hardware and Metal can get The Busy Man's Magazine for **one year.**

You would have to pay $150.00 to get **The Busy Man's** (the contents) **Magazine** in the ordinary way.

Get in your subscription in good time.

Two Better Than One

Two heads are better than one. The influence of two people is better than that of one of them.

Advertisers in a technical newspaper receive value in proportion to the buying influence of its readers.

A paper read by the general manager or proprietor, and by the superintendent or foreman, is doubly strong.

Canadian Machinery and Manufacturing News fills this bill—its advertisers have double assurance of reaching the man who buys.

The publicity that pays is secured through this strong medium.

TECHNICAL BOOKS

Have you noticed that the owners, managers and superintendents of manufacturing concerns who are constant readers of the best technical works, are the ones who succeed, who get the most out of their plant, their men, their material? It's a fact.

Keep in the front rank. Keep posted by reading the best technical books. Get them from

SADLER & HAWORTH

TORONTO MONTREAL

The **Best Selected Steer Hides, Tanned** by **Oak Tanning** make the **Leather** that **makes SADLER & HAWORTH BELTING.**

Through thirty years of practical **Belt Making**, we have found out all the "whys" and "wherefores."

It is to our interest to make **Good Belting,** and we do it.

We do not want you to buy only **One Belt.** We want to supply you with **All Your Belting.**

Our **Grades** will always be found to be **Uniform in Quality.**

We aim to make **Our Belts** a little better than the best. A trial order will convince you that **We Have Succeeded.**

Offices and **Factories** at **MONTREAL** and **TORONTO.**

IRON AND STEEL

Contractors' Equipment — **Iron and Steel Forgings**
Railway Specialties — **Engineers and Machinists**

All descriptions of Special Machinery manufactured to order

CATALOGUES AND QUOTATIONS ON APPLICATION.

Ontario Street, corner Moreau, Montreal

PAINT THAT IS PAINT

A MACHINE PAINT THAT WILL NEITHER CRACK NOR PEEL

Our Island City brand is known all over the country for its quality and durability.

It is easily applied and fills the iron firmly and well.

FOR MACHINERY it is made in paste form and can be used as a filler, applied with a knife, or thinned with turpentine and brushed on.

Make our acquaintance by writing for quotations and catalogue.

P. D. DODS & CO., Montreal and Toronto

Tangye Gas Engine

and

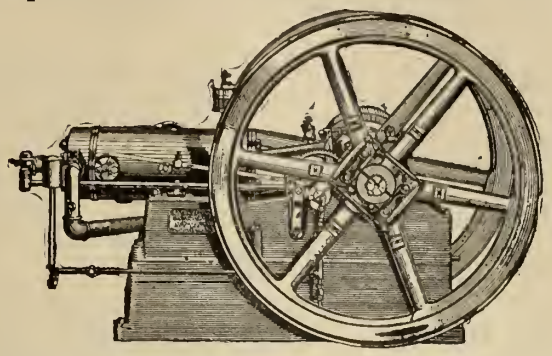
Dominion Gas Producer

THE BEST POWER COMBINATION IN THIS COUNTRY.

REMEMBER, the Dominion Gas Producer is built to use Pennsylvania and other anthracite coal with large percentage of ash and waste matter. Most of the others are only successful with high-grade coal that is hard to buy in this country and is more expensive :: :: :: :: :: WRITE FOR PARTICULARS

W. GILLESPIE, 98 East Front St., TORONTO

Dependable Power THE KIND YOU NEED



There is no better power available—
No more economical, steady and dependable power—
No power that will increase the capacity and decrease the cost of production so effectually—as that afforded by an

I.H.C. GAS AND GASOLINE ENGINE

Any man of ordinary intelligence can run an I.H.C. gasoline engine without previous experience
We would like to show you how much more simple they are than any other engines made—how much more easily they are operated and kept in perfect running order and why they develop more power from the same amount of fuel.
We illustrate and explain these points and every other detail in our complete catalogue. Every man who uses power or contemplates installing it ought to get this book.
You will find that the I.H.C line of engines includes just the style and the size best suited to your requirements.
Guaranteed to develop rated horse power.
Adapted to the use of gasoline, gas or denatured alcohol.
I.H.C. engines are made in the following styles and sizes:

Horizontal Engines—
Stationary—4, 6, 8, 10, 12 and 15 H P.
Portable— 6 8, 10, 12 and 15 H.P.
Vertical 2, 3 and 5 H. P.

Sylvester Gasoline Engines

Are the best that skilled labor can produce.

They are easy starting; they are simple and reliable; they will give full power in the coldest weather. Made in sizes from 4 to 32 horse power in portable snd stationary and from 1½ to 12 horse power in marine. They will run on gasoline, coal oil or distillates.

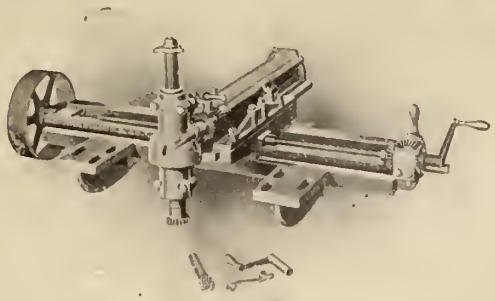
The SYLVESTER Engine inspires confidence because it is so simple in construction. It is the cheapest engine to buy because there is nothing to get out of order.

The SYLVESTER Engine is handsome in appearance, substantial in construction, marvelous in simplicity, unequalled for effectiveness and durability.

THE HIGHEST AND MOST PERFECT TYPE OF GASOLINE ENGINE BUILT.

If you require to purchase, write for Catalogue and our 1906 Calendar. We will then send our Travelling Salesman to you

THE SYLVESTER MFG. CO., Limited, - - LINDSAY, ONT.



Portable Milling Machine

Built of best material. Strongly geared. Does rapid and accurate work.
Can be used in any position. Run by hand wheel, small steam engine, air or electric motor.
Guaranteed to give satisfaction.

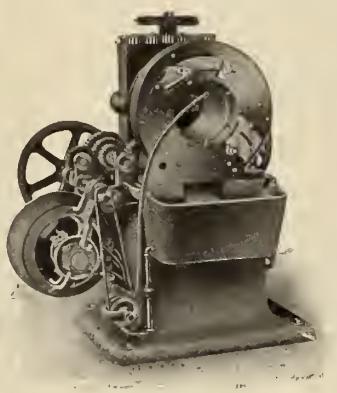
☞ More Information for the Asking.

H. B. UNDERWOOD & CO., 1025 Hamilton St., **Philadelphia, Pa., U.S.A.**

THE CAPACITY FOR WORK

of MERRELL PIPE THREADING AND CUTTING MACHINES—and this combined portable hand and power MERRELL in particular—is unlimited.

Remove the head from the base and use it as a portable hand machine if you wish. It will cut any kind of pipe.



Equipped with our standard quick opening and closing die-heads, improved cutting-off knife and new self-centering vise, this MERRELL will do more work in an easier, quicker and better manner than other machines.

As we make nothing but pipe threading machines we can guarantee each and every part of this machine to do its full share of work and not shirk. That's why we can afford to give it to you FREE for one month's trial.

Isn't this inducement enough?

Will you write to-day?

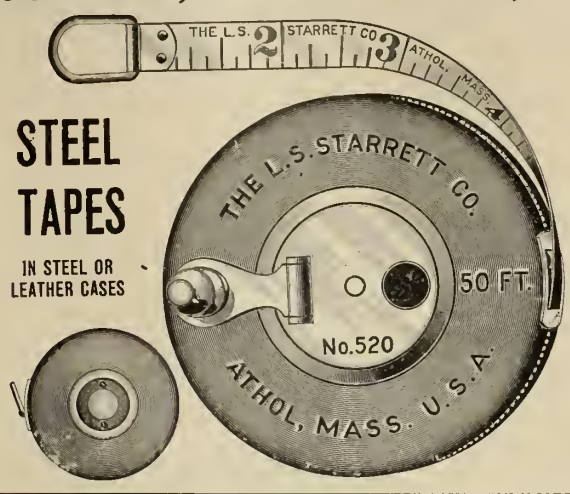
IMITATIONS ARE UNSATISFACTORY ——INFRINGEMENTS ARE UNLAWFUL

STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH



STEEL TAPES

IN STEEL OR LEATHER CASES

In our tapes the figures denoting feet are smaller than those denoting inches. Two reasons for this :

This dissimilarity of figures materially lessens (in fact ought to entirely prohibit) the liability to erroneous readings that frequently occur through the uniformity of all figures in steel tapes of other makers.

The smaller figures, denoting feet, allow the graduation line under each to be plainly visible, instead of being obliterated by the usual larger figure.

Graduated in feet, inches and eighths of an inch, or in feet, tenths and hundredths of a foot.

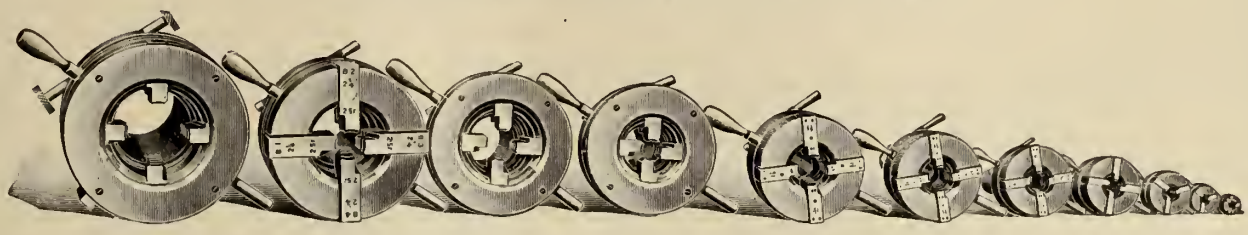
"BOYER" and *"KELLER"* Riveting Hammere

The Best Tools Ever Devised

for cutting **Duplicate Threads** of any diameter, on iron, steel, bronze or brass, are the **Geometric Self-Opening Screw Cutting Die Heads.**



SIZES TO SUIT EVERY REQUIREMENT.

Our Style "D" Die Head cuts right or left hand threads of any length—standard or special pitch. A micrometer adjustment assures the greatest accuracy and speed in changing the diameter of the threads. Dies are operated automatically by stopping the travel of the turret slide. Overcomes all the disadvantages of a solid die. Saves a lot of time when used on screw machines, turret lathes and the carriage of an engine lathe. If you want to reduce cost and increase output, send sample or blue print of your work—we will tell you size and price of the tool you need.

The Geometric Tool Co., New Haven, Conn.

Canadian Agents: WILLIAMS & WILSON, Montreal, Que. (Westville Station) **U.S.A.**

Instead of using Hack Saws that quickly overheat—that break easily—why don't you try a few **UNIVERSAL** Hack Saws?

UNIVERSAL Hack Saws are noted for their toughness.

They're fast cutters, and have sufficient clearance to cut easily without heating.

If you're looking for something better in Hack Saws

ENGINEERING:

AN ILLUSTRATED WEEKLY JOURNAL

Edited by WILLIAM H. MAW and JAMES DREDGE

PRICE SIXPENCE.

"ENGINEERING," besides a great variety of Illustrated Articles relating to Civil, Mechanical, Electrical and Military Engineering and Notes of General Professional Interest, devotes a considerable space in each issue to the illustration and description of all matters connected with the PRACTICAL APPLICATION OF PHYSICAL SCIENCE, and with its Wide and Influential Circulation in all parts of the world, this Journal is an

UNRIVALLED MEDIUM FOR ADVERTISEMENTS

SUBSCRIPTIONS (Home, Foreign and Colonial)

"ENGINEERING" can be supplied, direct from the Publisher, post free for Twelve Months, at the following rates **payable in advance**:—

For the United Kingdom - - - - - - - £1 9 2

For all places abroad:—

Thin Paper Copies - - - - - - £1 16 0

Thick " - - - - - - £2 0 6

Subscribers residing abroad are strongly recommended to order copies on thick paper, as the illustrations are necessarily very much less effective in the thin paper edition, and to remit, when possible, by Post Office Order made payable at Bedford Street, Strand, London, W.C. When Foreign Subscriptions are so forwarded, advice should be sent to the Publisher.

Foreign and Colonial Subscribers receiving Incomplete Copies through Newsagents are requested to communicate the fact to the Publisher, together with the Agent's Name and Address.

Cheques should be crossed "Union of London and Smiths Bank, Limited, Charing Cross Branch."

All accounts are payable to "ENGINEERING, LIMITED."

ADVERTISEMENTS.

copy

WE HAVE A FEW OF THESE MACHINES READY FOR IMMEDIATE DELIVERY

This machine is distinctly a cutter grinder, and was designed to fill the want for a machine to sharpen milling cutters of all kinds and shapes, without special fixtures or special-shape emery wheels, being heavy enough to eliminate all vibration and still be easily operated. It weighs about 1370 lbs. The table, which has a long bearing on the saddle, has a longitudinal feed of 20 in., cross adjustment of 7 in., with a vertical adjustment of 6 in. Cutters 1 in. to 14 in. can be taken between centres. The table can be used at different angles with the spindle in horizontal plane, by swiveling the knee around the column. The machine is compact, durable, adaptable and a necessity for the busy shop.

Have You Any Use For a Dictionary That Contains Definitions of About 5,000 Distinct Words, Terms, and Phrases Employed in the Practice of Electrical Engineering?

No matter whether you are an expert electrical engineer, or an every-day electrical workman, your answer cannot be other than "yes"—unless you already have a copy.

When you know that the dictionary of which we are speaking is called

STANDARD ELECTRICAL DICTIONARY

and is compiled by no less renowned an authority than Prof. T. O'Conor Sloane, you will readily understand why ten editions of the book have been issued.

In his preface the author says: "The science [electrical] has expanded so much that the limits of what may be termed strictly a dictionary of the present day, would a few years ago have sufficed for an encyclopedia." **There you have an idea of the scope of the "Standard Electrical Dictionary."**

Again: "Each title or subject is defined once in the text. Where a title is synonymous with one or more others, the definition is given under one title and the others appear at the foot of the article as synonyms. It may be that the reader is seeking the definition of one of these synonyms. If so, a reference to the index shows him at once what page contains the information sought for. . . . . Where a title embraces several words, all orders of the word will be cited in the index." **There you have an idea of the serviceability of the "Standard Electrical Dictionary."**

There are 682 pages, 393 illustrations, and the price (postpaid) is

$3 00

STRENGTH *and* BEAUTY

¶ The above view is typical of the two essentials in a good engraving, especially a Machine Engraving. Strength involves accuracy, sharpness, and correct detail, while Beauty means symmetrical lines and artistic finish.

¶ In other words, machine illustrations of the first quality demand the services of experienced Mechanical Artists. Ours have been at it nearly Twenty Years.

Send for Sample Proofs

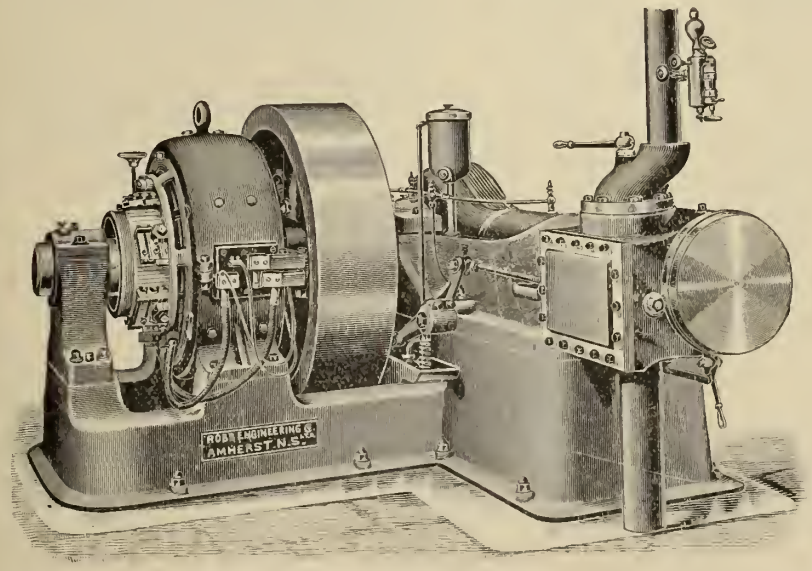
Not One Cent for Repairs!



An Experienced Engineer writes us as follows:

"After eighteen months of hard service, the 'Robb' engines are in excellent shape, running very smooth and without a bit of vibration. Up to this time they have not cost one cent for repairs, the only expense being for steam, oil and packing, and this lower than the average. Perfect alignment, parts well machined and good design, make the 'Robb' the most economical and labor-saving engine that has ever come to my notice."

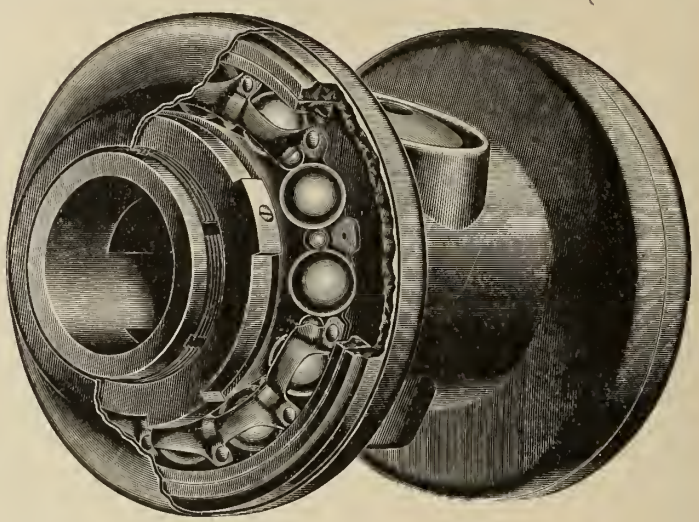
CHAPMAN DOUBLE BALL BEARINGS

Should You Not Use Them When You Can

Save

- 75% Shaft Friction
- 95% Lubrication
- 100% Re-babbitting
- Wear and tear on belting.
- Danger of Fire from Hot Boxes.



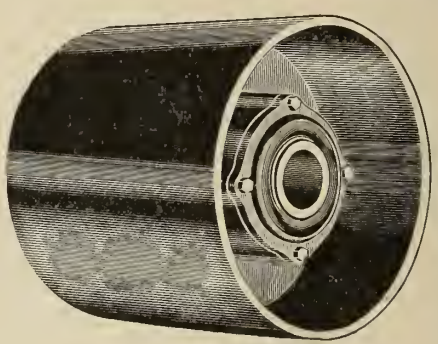
Let us tell you what it will cost to make these savings for you.

THE CHAPMAN DOUBLE BALL BEARING CO. OF CANADA, LIMITED

OFFICE—39 SCOTT STREET. TORONTO.

The Question You Must Decide is not How Well You Have Got Along With Friction Bearings, or None at All, but How Well You Can Get Along With

Dominion Henderson Bearings



So much power is necessary to turn out every bit of work in your shop. If you are reckoning that "so-much" on the true basis, because you are using Dominion Henderson Bearings, the waste element will not figure largely in your power expenditures.

If you are reckoning the "so-much" on the "untrue" basis because you are using old-fashioned friction bearings, or no bearings at all, the waste element will figure largely in your power expenditures though naturally you will not like the idea of calling it waste.

Nevertheless these are the facts and we are ready to consider them with you.

NOTE.—We are on the market to design special machinery of any sort, to develop inventions, and to do work on Cleveland Automatics, and Brown & Sharpe Grinders.

The Dominion Henderson Bearings, Limited, Toronto, Canada

Modern Canadian Manufacturing Plants.

ARTICLE XIX.—New Plant of The Fairbanks-Morse Canadian Mfg. Co.

THE latest large addition to the industrial development of Canada is the plant of the Fairbanks-Morse Canadian Mfg. Co., established on Bloor street west, Toronto. The last two or three years have witnessed the coming of several large American manufacturing concerns into Canada in the form of Canadian incorporated companies, in which there is more or less Canadian capital. This is done in order that the interest of these companies may be advanced in Canada. In these plants it is evident that as far as possible Canadian labor has been employed, and in the building and equipping of the plants Canadian firms have had the preference, except in the cases of special machinery which has in most cases been imported from the United States. In some plants, of course, this policy has been carried out more minutely than in others.

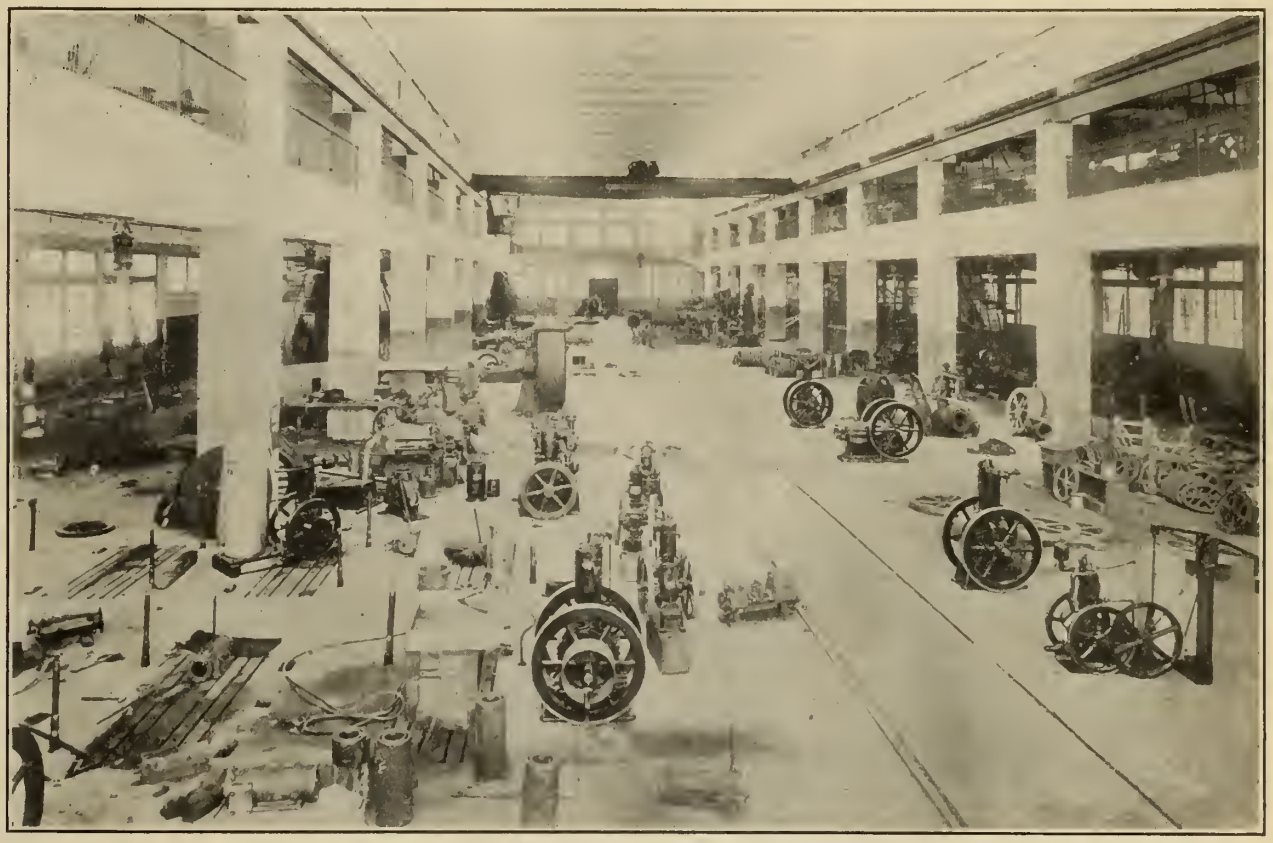

FIG. 1—Fairbanks-Morse Canadian Mfg. Plant—A General View of Machine Shop and Erecting and Testing Floor.

The Fairbanks-Morse Canadian Mfg. Co. has been incorporated in Canada to manufacture in this country the products made in the United States by Fairbanks, Morse & Co., although at present, at least, the product will be confined to gas, gasoline, and oil engines and steam pumps, in order that the advantages of specialization in manufacturing may be secured. The Canadian Fairbanks Co., who are sole Canadian selling agents, through their offices in Montreal, Toronto, Winnipeg and Vancouver, had found that the demand for the Fairbanks-Morse engine and pumps warranted the building of a plant in Canada for their manufacture, and that being the case made arrangements with Fairbanks, Morse & Co., Chicago, to erect a plant to manufacture their lines in Canada. The result has been the combining of interests to the extent of nearly a million dollars in a plant in Toronto.

The site of the new plant is situated between the Grand Trunk and Canadian Pacific Railways, at 1379-1387 Bloor street west, Toronto, on a lot 10 acres in extent, which will allow amply for extensions. The plant as at present established consists of four buildings—the machine shop, 285 x 106 ft.; the foundry, 72 x 130 ft.; the blacksmith shop, 72 x 98 ft., and the power house. The arrangement of the shops is shown in the accompanying plan, Fig. 2. The company have sidings from the G.T.R. as shown, and have tracks running into the south end of the machine shop, which section constitutes the erecting floor, and also tracks between the power house and foundry, as shown, to supply coal conveniently. Thus the company have good shipping facilities.

All the buildings are reinforced concrete construction, with concrete foundations and floors. This construction includes roof, roof girders, as well as columns and walls. For communication

between the buildings and around the yard, there is a system of industrial railways. The heating and ventilating system for the plant was installed by the galleries. Practically all the machines on the ground floor are placed under the galleries with the exception of the larger machines, which project

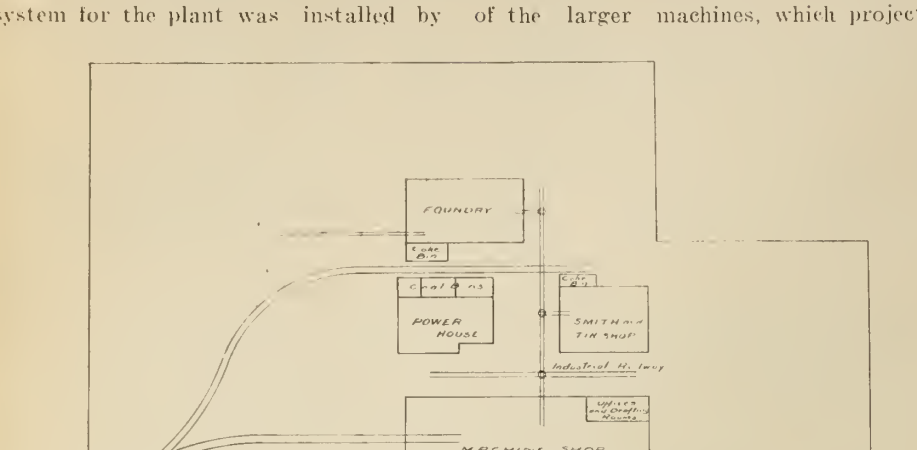

FIG. 2.—Fairbanks-Morse Canadian Mfg. Plant.—Plan of Plant.

the B. F. Sturtevant Co., and is the hot-blast system, the fan and motive power being a standard Sturtevant unit, and the hot air blast being conveyed to different parts of the plant through concrete conduits, which are tapped through the floor wherever necessary, the openings being provided with draft regulators and grating. The buildings are lighted by Adams-Bagnoll arc lamps, the system being installed by the Keystone Engineering Co., Toronto.

The Machine Shop.

The machine shop is situated in the main building, which constitutes the erecting shop and shipping department as well. This building might be said to consist of three bays, in that there are two lines of columns extending down the building, the centre bay being opened for the two stories, while the side bays are each provided with a gallery. The main or centre bay is served with an 8-ton Niles electric traveling crane, operated by Fairbanks-Morse D.C. variable speed motors, the travelways being supported on the reinforced-concrete columns. This shop is lighted by a double row of windows along the sides and ends, and by a skylight over the centre bay extending the entire length of the building. The windows and skylights are provided with metallic frames, with ribbed glass in the windows and wire glass in the skylight. The building is practically fire proof inside and out, the stairs to the galleries even being made of concrete. The floor of the building is concrete, as before mentioned, and is covered with three inches of pine and maple flooring. The machines in the shop are driven in groups, by D.C. Fairbanks-Morse motors operating upon the three-wire system, the sections of shafting running down the middle of the side bays under considerably into the centre bay. This leaves ample floor space for the handling of the parts to be machined. Looking down the shop one is impressed with the appearance of lightness and roominess which it presents. The shafting throughout the plant is equipped with Chapman double ball bearings, which are giving entire satisfaction. A general view of the machine shop, erecting floor and shipping department is given in Fig. 1.

One of the most striking features of the machine shop equipment is a large planer-type milling machine, built by the Ingersoll Machine Co. This machine is shown in Fig. 3, and is equipped, as may be seen, with four milling heads, two vertical and two horizontal. The machine is for general work, but is chiefly engaged in machining engine bases and water boxes. Other special tools are a Gisholt turret lathe, two American semi-automatic turret lathes, two Pratt & Whitney automatic turret lathes, a Bausch multiple spindle drill, a B. F. Barnes gang drill, a special radial drill built by the Fosdick Machine Tool Co., a horizontal boring mill made by Beaman & Smith, and Brown & Sharpe grinders, milling machines and automatic gear cutters. All the standard tools, including lathes, planers, drills, boring mills, key seaters and shapers, are John Bertram tools. Fig. 4 shows a group of these tools, including a large planer on which engine beds are machined, a number at a time, and also in the foreground a standard radial.

Tool Room and Grinding Department.

In the balconies are situated the tool room, the grinding room, and the small erecting floor and store room. In the grinding room is a group of four grinders made by the C. H. Besley Co. and the Gardner Machine Co., on which is done standard work usually performed on milling machines. For work that does not require extreme accuracy this grinding method of finishing certain parts is found to be very satisfactory. Each of the machines is provided with a suction draft dust conveyor, which eliminates the dust nuisance.

In the tool room are made all the tools and jigs used in the shops, and, therefore, it has a very complete equipment. This equipment consists of Brown & Sharpe grinders, Gould & Eberhardt gear cutters, Brown & Sharpe milling machines, American Tool Works shaper, two Hendley Machine Co.'s lathes and a Barnes drill. Fig. 5 is a view of the tool room.

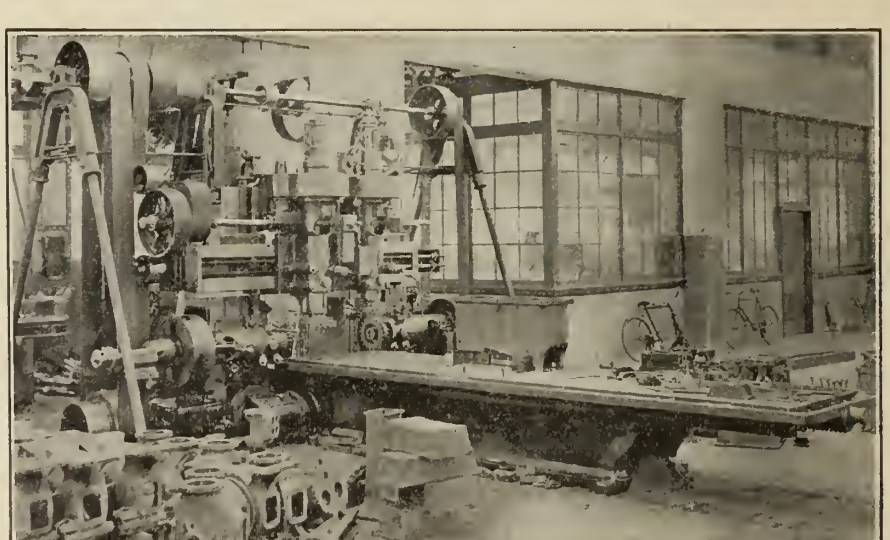

FIG. 3—Fairbanks-Morse Canadian Mfg. Plant—Ingersoll Machine Co.'s Milling Machine.

The Duplicating of Parts With Jigs.

A feature of considerable interest in this plant is the system of manufacturing parts for the engines. As is known,

the parts of the Fairbanks-Morse engines are standard, and each part is specified so that any part of an engine can be replaced by the company on request. In order that each similar part for one engine be accurately duplicated a special jig is made for the matching of each. The advantage of having parts of engines interchangeable is very apparent, and the value of this to the sales department makes up fully for the extra manufacturing investment. These jigs are kept in the tool storage room, and they are looked after in the same way that tools are. The tool room system adopted is as follows: Each mechanic upon entering the employ of the company is supplied with a number of tool-room checks, six in this case, for which he is held responsible. When he wishes a tool from the tool room he is required to substitute one of his checks for the tool. This prevents any one mechanic having more than six tools or jigs out at the same time. Of course all tools needing repairing go to the tool room, and while they are in his department the foreman of the tool room is responsible for them.

FIG. 4—Fairbanks-Morse Canadian Mfg. Plant—A Section of the Machine Shop.

Testing and Shipping Floor.

Before leaving the shop every engine is erected and given a thorough test, the method of rating being by brake horse power. For convenience in testing the testing floor is provided with cast iron bed plates, to which the engines can be bolted down, and close at hand are underground connections for gasoline, gas, water and exhaust. In the foreground of Fig. 1 are shown several engines ready for shipment and also several others undergoing a test.

The Foundry.

The company are well satisfied with the work being turned out from their foundry, and they have good reason to be. One has only to make a casual examination of one of the castings to know that good work is being done in that department. The chief features of interest in the foundry is the set of three Griffith molding machines, which are used in the molding of complicated parts. A complete description of these machines will be given in a later issue of Canadian Machinery. A view of the foundry is given in Fig. 6. The building is served with an 8-ton Niles electric crane, and it is also equipped with pneumatic hoists on travelways. The chipping and cleaning department is equipped with R. McDougall tumbling barrels, an important feature of which is the suction draft apparatus for removing the dust. The cupola was supplied by the Whiting Foundry Equipment Co. The charging floor of the cupola is reached by an electric elevator and the fan supplying draft for the cupola is motor driven.

The Forge and Tin Shop.

Here the crank shafts for the engines are forged, and the water and gasoline tanks for the portable engines are made. One corner is also used as a pattern shop. The outstanding features of the equipment of the building are a bulldozer made by Williams, White & Co., and a John Bertram steam hammer, which has of late been used as a pneumatic hammer. This department is also equipped with a shear made by the Niagara Machine & Tool Works, and a band saw and a surfacer supplied by H. W. Petrie. The shafting is, of course, driven by a D.C. Fairbanks-Morse motor.

Power House.

Undoubtedly the most interesting feature of this plant is the power house. Here there is in operation a complete producer gas electric generating plant, and there is not a sufficient number of these plants in operation in Canada to

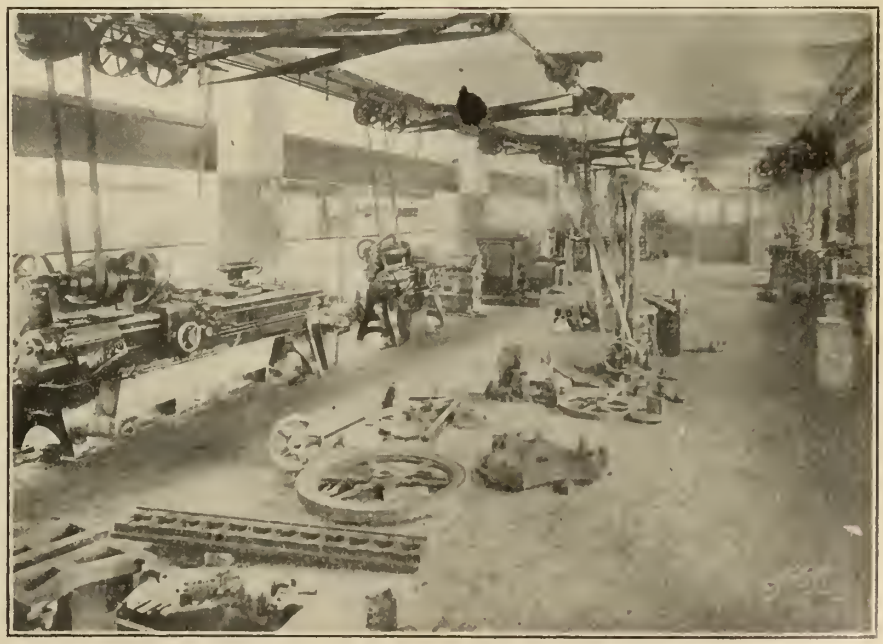

FIG. 5—Fairbanks-Morse Canadian Mfg. Plant—The Tool Room.

make this one otherwise than unique. It is of great interest to witness the operation of these gas plants in actual practice, and having done this one will realize more fully than he probably has before, what an important part the producer gas engine and the producer plant are to play in the field of prime movers. An interesting feature about the power plant itself is the fact that the complete equipment, from the producers to the dynamos, is furnished by one firm, the Fairbanks-Morse Co. A view of the complete plant is shown in Fig. 7, although only a glimpse of one of the producers can be obtained through the doorway.

FIG 6—Fairbanks-Morse Canadian Mfg. Plant—View of the Foundry.

The plant consists of two 150 h.p. suction producers supplying gas for the two 150 h.p. vertical, throttling, electric lighting gas engines shown in the view, and four dynamos, two run from each engine. Provision has been made for the addition of another producer and engine and two more dynamos.

A record of the coal consumption of this plant will probably be the most interesting feature to the power user, and perhaps the results obtained may surprise many. It is estimated that the coal consumption has averaged one pound of pea anthracite per brake horse power, which is one quarter pound better than the Fairbanks-Morse Co. guarantee their plants to operate upon, and at the market price of anthracite coal it is estimated that the average cost per brake horse power-year is $8.50. To all appearances the producers give absolutely no trouble, the only thing being to keep them supplied with coal and to poke the fire with a long poker through the top of the producer after each fresh supply of coal. In this plant this is done every half hour or so.

The power house is also equipped with two steam boilers used for heating the building, and there is, too, an air compressor, operated by an electric motor, supplying air for the pneumatic hoists in the foundry, and for the hammer in the forge shop.

A feature of this power house is the spacious coal bins, which are built entirely of concrete.

Offices and Drafting Room.

In one corner of the machine shop building are the offices and drafting rooms, which are commodious and comfortable. The time clock, supplied by W. A. Woods, Montreal, is situated just outside of the office door leading into the machine shop.

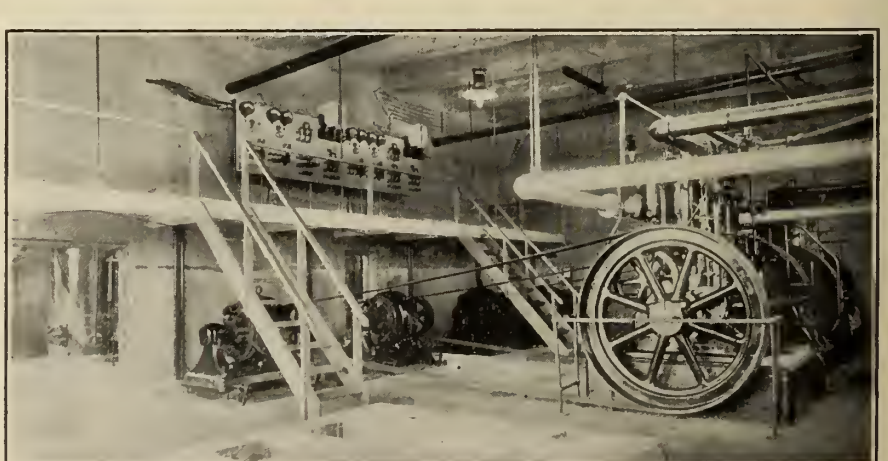

FIG. 7—Fairbanks-Morse Canadian Mfg. Plant—The Power House.

In this plant Canada has one more industry of which she might well be proud, and its establishment here is further evidence of the general industrial expansion of Canada at the present time.

FACTORY CONSTRUCTION.

In the construction of a factory at the present day, perhaps more than ever before, simplicity should be the one great feature, and this should be found not only in the arrangement of the machinery, but all through, from the time the lumber leaves the pile or kiln until it is loaded into the car. Life is too short and competition too keen to handle the product twice if once will do; besides, the extra handling does not usually improve the stock. The initial cost is not the only thing to be looked at in constructing and equipping a factory. The whole system of working is the main thing to be carefully systematized, and the proper time to do this systematizing is when the plant is being designed. Economy is a good thing, but it should be used only in its proper place. It should under no consideration be employed to the extent that we use a lot of unsuitable machinery just because we can save money on the initial cost. Put in the machinery that will give best results with the least cost for maintenance and operation. Have everything proportioned, but it is always well to figure on a little surplus power. Have everything strong, then keep it running. —The Woodworker.

Inquisitive French Bishop to Duke de Roquelaire, passing in haste through Lyons: "Hi! hi! Where have you come from?" "Paris." "What is there fresh in Paris?" "Green peas." "But what were the people saying when you left?" "Vespers." "Goodness, man, who are you? What are you called?" "Ignorant people call me Hi! Hi! Gentlemen term me Duke de Roquelaire. Postillion, drive on!"

*Gas Engines in Commercial Service**

By J. R. Bibbins

Gas vs. Steam.

TO obtain a full appreciation of the point at issue it is necessary to "figure back" from engine shaft to coal pile, taking a broad survey of the complete plant as a means for converting thermal energy into useful work.

In the chart, Fig. 1, the writer has attempted to make an approximate distribution of losses in various parts of the plant, based upon observations from numerous sources on each of its component parts. It is believed that the estimates are not unduly partial to either a gas or steam plant of moderate size. In every large and highly equipped plant the net efficiency would presumably be higher.

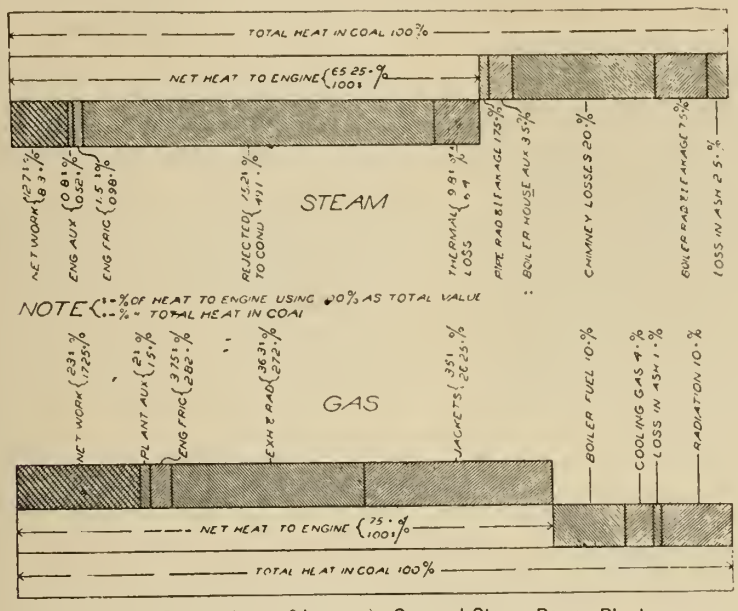

FIG. 1—Comparison of Losses in Gas and Steam Power Plants.

Starting with the heat in a fair grade of steam coal, 13,500 B.Th.U. per pound, we find 35 per cent. of this heat dissipated in the boiler plant and piping system, and 25 per cent. in the producer plant; 57 per cent. is, however, dissipated in a steam engine and approximately the same in the gas engine, leaving 8.33 per cent. net output for the steam plant and 17.25 per cent. for the gas plant. Thus, on a heat basis, gas is twice as efficient as steam.

Part of the advantage lies in the more efficient converting properties of the producer and the remainder in the higher thermal efficiency of the gas engine. In natural gas plants, where no producers are necessary, there is, of course, no question as to the superior economy of gas. An 800-h.p. gas central station at Bradford, Pa., several years ago, replaced steam power by a gas engine plant, the change resulting in an immediate reduction of gas consumption from 86 cu. ft. per kilowatt hour to 21.5 cu. ft., or 75 per cent.

Granted the superior economy of the gas plant, it does not always follow that the ultimate cost of power is reduced in exactly the same proportion, for it is necessary to take into account not only operating costs, but also investment costs or fixed charges to arrive at a proper conclusion. Without going into this economic problem here it is sufficient to say that plants of a few hundred kilowatt capacity may quite possibly cost more per kilowatt than a steam plant of corresponding size and character, but the saving in the operating expenses will soon wipe out the extra cost and eventually put steam "out of the running."

Power Plant Duty.

Two gas plants afford a good proof of the above conclusions. One is a small producer-gas power plant in industrial works service, less than 500 k.w. capacity. It uses a fair grade of bituminous coal costing $2.30 per ton, and gives 24 hours' service on a widely fluctuating load. The data includes all the coal used for the making of new fires and for all standby losses during Sundays and holidays. Operating on a station-load of from 50 per cent. to 75 per cent. the coal consumption is but little over 2 lbs. per kilowatt hour — certainly a remarkable economy for so small a plant. At 20 per cent. load factor 2.9 lbs. of coal and 80 per cent. load factor 1.9 lbs. per kilowatt hour is required.

Again, Fig. 2 summarizes the economic results of numerous tests of the St. Louis Fuel Testing Laboratory. These tests varied from 15 hours to 30 hours in duration, and included many grades of fuel from the poorest western lignites to the richest West Virginia bituminous coals. With a plant of only 175 h.p. capacity and of the belted type, the local consumption averaged between 2 lbs. and 2.25 lbs. per kilowatt hour within the ordinary range of steam coals. But observe that with the lignites, running as low as 6,500 B.T.U. per pound, the coal consumption has scarcely doubled. It would manifestly be impossible to run a steam boiler efficiently on such poor fuels, but the producer seems to be able to efficiently

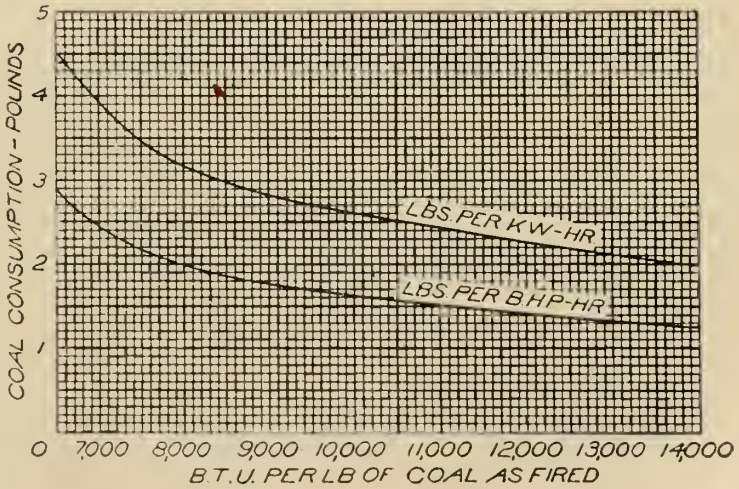

FIG. 2—Coal Consumption Curves for Producer Gas Plant in the St. Louis Testing Laboratory.

* Paper read before the Ohio Society of Electric and Steam Engineers.

gasify the poor fuels almost as well as the rich.

The Gas Engine in Service.

Granted again the superior economy of the gas power plant, there still remains the question of its ability to sustain the fluctuating loads and hard service required of a modern prime mover. The best answer to this question is a glance at the results that have been obtained in numerous plants both in this country and abroad.

Is the gas engine limited in its general application? Unqualifiedly, no! Within less than a day's ride of Pittsburg, gas engines may be found operating side by side with or in place of steam engines in almost every modern industry where power is used. In Pittsburg alone you may find gas engine plants of from 100 h.p. to 2,200 h.p. In industrial works service alone twenty plants are at work, representing some of the most conservative commercial organizations in the country, such as the Carnegie Steel Co., American Bridge Co., American Sheet & Tin Plate Co., McClintic-Marshall Construction Co., Riter-Conley Mfg. Co., and the four Westinghouse Companies.

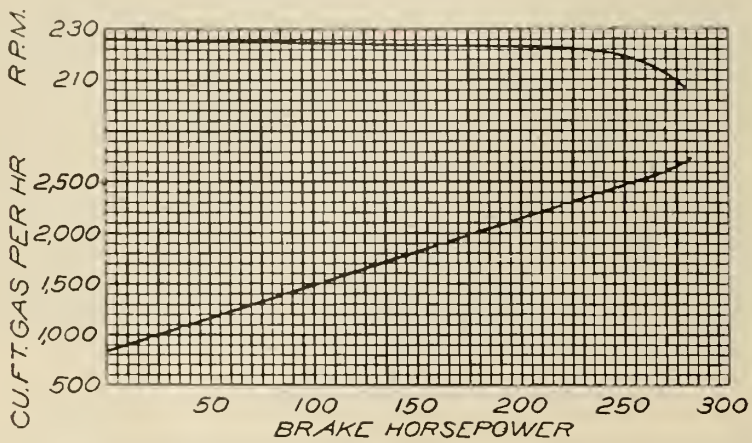

FIG. 3—Speed Regulation and Total Fuel Consumption of Typical Gas Engine.

Regulation.

Taking up now some specific points; probably more uncertainty exists as to the ability of the gas engine to drive electrical machinery, particularly alternation-current machinery, than regarding any other question in its application. Here again we may turn to field practice for light. Of the twenty Pittsburg plants mentioned above, the majority are operating electrical machinery, and in most cases, direct connected. Moreover, about half of this number are driving alternating-current generators in parallel upon a common bus bar. And it must be remembered that the service which these plants are doing in furnishing industrial power is more of a test of their running qualities than would occur in any electric lighting plant where the load increases and decreases gradually.

Most of these engines are of the three-cylinder single-acting type, and an analysis of the crank effort shows a resultant, so much more uniform than in the case of a single-cylinder engine that parallel operation becomes feasible where the single cylinder would be absolutely out of the question.

Most of the prejudice against gas engine regulation arises from acquaintance with small single-cylinder machines running on the "hit or miss" principle. This system has long since been absolutely displaced by the simple throttling system for electric work; in fact, any system, where the impulses are uniform, will give fairly desirable results. In the throttling method of regulation, the quantity of gaseous mixture delivered to the cylinder is directly proportioned by the governor to the load on the engine, but the quality of this mixture, i.e., the proportion of air to gas, is maintained quite constant for all loads.

Diametrically opposed to this method is the "impoverishing" system in which the gaseous mixture is weakened, i.e., as the load becomes lighter less gas is introduced. It has the disadvantage that the efficiency of combustion falls off rapidly on all loads except that at which the proportion of gas and air is just right for perfect combustion. Furthermore, on light loads the impoverished mixture becomes so weak that ignition is not always certain, as is clearly shown by experiment, a diminution of 5 per cent. in the gas results in a loss of over 20 per cent. in pressure. On the other hand, the throttling system is somewhat handicapped on light loads by the effect of the pump work which the engine must do to supply itself with the mixture, this work appearing as a negative quantity in the indicator diagram. Above half load, however, this pump work is of little importance, and full load can scarcely be detected on the card.

Regulation is much affected by the time lag of the gaseous mixture in reaching the cylinder. It must be remembered that every cubic inch of mixture that passes the governor valve must do work in the engine before the speed is again under governor control. Hence long passages of considerable cross-section between governor valve and cylinder tend to reduce the fineness of regulation. Manifestly, in multi-cylinder engines the ideal point for effective governor control is right at the admission valve, and in fact this idea has been carried out in a number of types of horizontal engines, such as the Westinghouse. Each end of each cylinder is independently controlled from the governor, and the functions of both admission and mixing valves are combined in a single valve of simple construction.

Another important principle in securing sensitive regulation is that the actual work of moving heavy valves should not be imposed upon the regulator itself. In the double-acting engine above mentioned, a relay type of control has been adopted with demonstrated success. A continuous enclosed oil pressure system, operating under 40 lbs. to 60 lbs. per square inch, does the actual work of valve movement by means of a double-acting oil cylinder. The control of this cylinder is vested in a small pilot valve actuated directly from the regulator. Thus the friction load upon the regulator is negligible, and, at the same time, comparatively unlimited power is instantly available

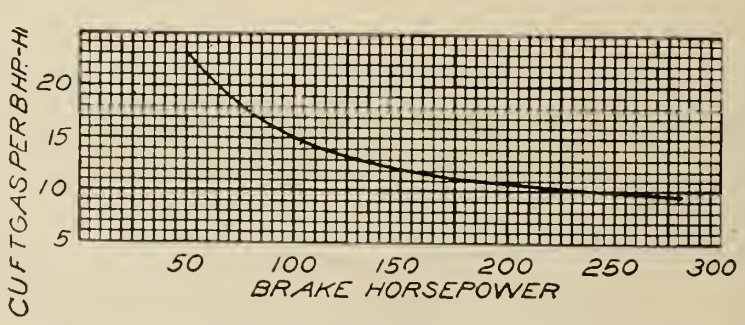

FIG. 4—Variation of Gas Consumption with Load.

at the main valves with the slightest change in speed.

This whole question of regulation may be best appreciated from actual speed, load and voltage records, taken simultaneously. It is one thing to tell you that on gas engines we obtain a speed variation of from 2 per cent. to 3 per cent. from no load to full load, and on horizontal tandem engines a still closer degree of regulation; but it is another to observe this for ourselves from actual records. Figs 3 to 6 give a resume of a typical test on a three-cylinder, single-acting gas engine taken at random from our records of over 1,000 gas engine tests. The speed curve, Fig. 3, shows a variation of 0.7 per cent. at half load, 1.4 per cent. at full load, and 2.7 per cent. at 18 per cent. overload; with still greater overload the engine began to slow down.

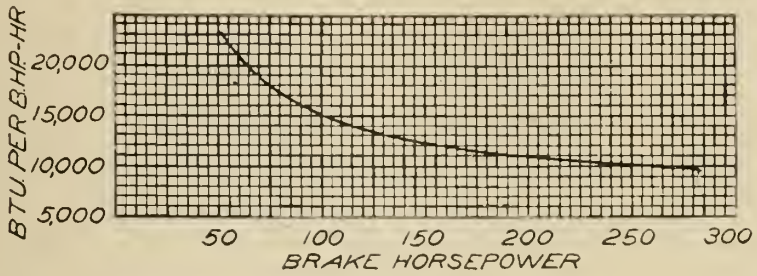

FIG. 5—Heat Consumption and Load.

An interesting case of mistaken prejudice against gas engine regulation occurred in an English spinning mill where a gas engine was installed to replace a steam engine. The former was a vertical two-cylinder double-acting engine, and the latter a horizontal tandem compound. The officials at first were very dubious about the ability of the gas engine to give sufficiently close regulation for spinning work. By tachograph records taken first on the steam engine, and later on the gas engine, showed a total cyclical variation of over 8 per cent. for the steam engine, and about 0.2 of 1 per cent. for the gas engine.

Maintenance.

A favorite argument of the steam engine enthusiast is that the cost of keeping a gas engine plant in repair is so enormous as to nullify the advantages accruing from its higher inherent efficiency. It is hard to offer rebuttal to statements of this kind because disparaging data is always available to those who have a purpose in view. It is only necessary to say that when maintenance cost is excessive we may look for faulty operation or design of the plant.

Results from the Bradford central station are apropos at this point. The plant which aggregates 800 b.h.p., with five belted units, is in its eighth year of service, yet the average cost of repairs on gas engines exclusively for the last two years was $92.70 per annum, which is equivalent to 11.6c. per horsepower year, or 0.0125c. per kilowatt-hour generated.

For service averaging 18 hours a day, it is found necessary to inspect the engines only once in twelve months. At each inspection, a set of piston rings is replaced by new ones, whether worn out or not. The present exhaust valves average one year's work without regrinding, and even then are not in bad condition. Some valves have run over fifteen months. Admission valves require practically no attention. Igniters average about nine months without repointing.

In the 2,000-kilowatt central station at Walthamstow, London, the annual expenses for repairs and renewals during 1904 averaged 0.065c. per kilowatt-hour generated, including repairs not only to gas engines, but also to producers, electrical machinery, switchboards, batteries, distribution system, and consumers' meters.

It will be of interest to know of a record run made in the State of Ohio by a 650-h.p. Westinghouse gas engine, which has been at work for several years compressing gas for long-distance distribution. Owing to a break down in another part of this plant this engine was compelled to run under maximum gas load continuously, day, night and Sundays, for forty days without shutting down. During this period not a mishap of any kind occurred, and upon examination of the engine at the end of the run no repairs were necessary.

Cost of Power.

Out of the several items constituting the operating cost of power, viz., fuel, labor, supplies and repairs, fuel is, of course, the most important, and it is worth while pointing out here how easily one may be fooled in making comparisons between steam plants and gas plants. In a high-grade steam plant, the cost of coal usually runs from 55 per cent. to 60 per cent. of the total cost. This leaves about 20 per cent. for labor, the same amount for repairs, and the balance for supplies. In a producer-gas plant on the other hand, the fuel item is proportionately smaller, in fact from 35 per cent. to 45 per cent. of the total operating cost. This necessarily places a larger per cent. of the costs upon the remaining items. Hence in comparing the distribution of costs between steam and gas stations it may readily occur that the latter shows a higher percentage in cost of labor, supplies, or repairs, whereas it is relatively superior in these respects.

Quoting actual figures, the operating costs of the 800-h.p. Bradford station, including heating of buildings, with the price of gas ranging from 12c. to 17c. per 1,000 cubic feet, and a station-load factor of less than 20 per cent., ranged between 0.8 and 0.9 cent per kilowatt-hour metered at the switchboard. The distribution of expenses averaged as follows: Fuel, 42.8 per cent.; labor, 43.7 per cent.; supplies, 8.0 per cent.; total repairs, 5.6 per cent., of which the repairs of the gas engine alone was 1.4 per cent. This plant is not particularly efficient. The machinery, with a single exception, is all old style and belted, but the station is run with care, and intelligent attention is given when it is needed, which in part accounts for the low cost of repairs.

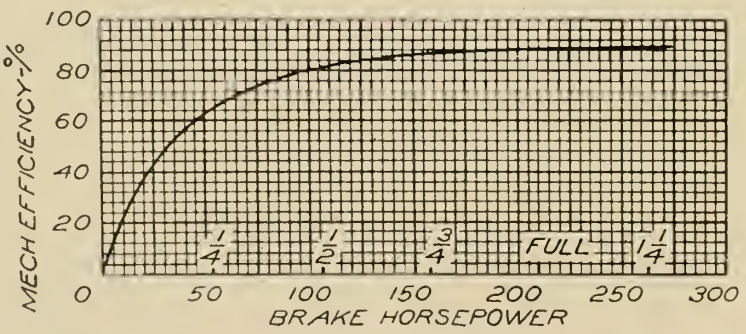

FIG. 6—Efficiency and Load.

That country is the richest which nourishes the greatest number of noble and happy human beings; that man is richest who, having perfected the functions of his own life to the utmost, has also the widest helpful influence, both personal and by means of his possessions, over the lives of others.—Ruskin.

SEPTEMBER METAL FEATURES.

ALTHOUGH the market of early September was calm and remained stationary for a much longer time than usual, the closing days of the month have contained sufficient excitement to make up. Many lines, both in ingot and sheet metals, are now commanding higher prices than they were a month ago, while it may be safely said that from pig iron to tin every commercial metal has improved in tone during September.

Copper has been advancing right along in primary market, and, although Canadian jobbers have made no change in their quotations, it is hard to see how they can long continue existing prices. Antimony has gone up about half a cent, and tin is firmer than has been the case for some time past. Zinc spelter has been affected here by a steady advance in Old Country markets, and higher prices are now being quoted. Pig iron, as is well known, has experienced a demand which has more than taxed the capacity of furnaces, both on this continent and in Great Britain. Nearly all the producing plants are booked for several months ahead, and many popular grades have been temporarily withdrawn from the Canadian market. Foundrymen and other consumers of pig iron have been so impatient for deliveries that importers who had stocks on hand were able to obtain stiff figures. But it has remained for pig lead to cap the climax. Prices are now fully 25 cents per hundred pounds higher than at the first of the month. In fact, not since 1888 has such a condition existed. More than that, it is almost out of the question to obtain prompt deliveries on any large quantities. All lines of sheet metals are active. Galvanized sheets have been advanced by manufacturers and importers, and booking for forward delivery in the Spring is very heavy. Sheet lead and sheet zinc have gone up, in sympathy with pig lead and spelter respectively, and tin plates have also advanced in primary markets. A shortage in galvanized Canada plates is being keenly felt. One of the leading interests in the country has informed us that not a box of these goods has been placed in their warehouse for weeks, most of their importations being snapped up even before reaching this country.

It is a long time since strength and firmness have been so generally felt on the metal market, and from all appearances quotations are bound to go much higher yet in several lines.

TECHNICAL EDUCATION.

IT has undoubtedly been a good move on the part of the Canadian Manufacturers' Association to take up the question of technical education. The rapid growth of Canada industrially necessitates that there be a more adequate means for the education of Canadian engineers and mechanics technically than at present exists; and the action taken by the association is a step in the right direction. The industrial development of a country depends very largely upon the skill of its engineers and mechanics, and the experience of Germany and other prominent industrial countries has proved that it pays to provide means of increasing and developing this skill. The technical education committee, at the recent convention in Winnipeg, reported that the Government will take favorable action along this line early in the coming session. So far, so good. But while the Manufacturers' Association as a body are considering the question, the individual manufacturer should not think himself relieved of all responsibility; he is not, because individual effort is required as well as combined effort. It is to the advantage

of each manufacturer to have his employes as skilled as possible in their respective trades or duties ; and he can take steps towards this end with very little trouble or expense to himself, and in so doing he would at the same time be advancing the general interests of technical education. A well known automobile manufacturing firm allow their designers and draftsmen an hour each day in a reading room provided with practically all the technical automobile periodicals published, as well as a small library of books relating to automobiling. No doubt this is a paying investment for this firm, and similar practices might well be adopted more generally. Even should a manufacturer not feel justified in such an investment of his employes' time, he might at least provide a small library of books and periodicals for reference purposes without any fear of the investment not being a remunerative one. Undoubtedly those concerned in the designing and those superintending the manufacture of the product would receive much benefit from such a library, which benefit of a necessity would be reflected to the manufacturer. Then, too, the mechanics in a plant should not be overlooked, and it would appear a feasible scheme to allow them access to a reading room during noon hour, where might be found copies of mechanical trade journals and a few copies of standard works on subjects in which their work would lead the men to be most interested. The happy results of such a scheme would be two-fold, namely, profitable employment during noon hour would be provided and at the same time the ambitious mechanic would be led to take a greater interest in reading than the average at present does. Such a scheme would certainly be advancing the interests of technical education, and would also be worth the investment to the manufacturer.

A NEW MACHINERY HALL AT THE EXHIBITION.

IN this issue we have devoted considerable space to the Canadian National Exhibition, taking up the discussion of the necessity of building a new and up-to-date Machinery Hall. We publish opinions given by a number of manufacturers and machinery dealers on this question, but owing to lack of time we were not able to make this as complete as we would have wished. In view of this we will be very pleased to have any of our readers send in a statement of their views on this question, especially if they have any suggestions as regards the size and style of a suitable building, which we will publish in our next issue.

DESCRIBING NEW MACHINES.

NO trade paper can be a force in its field if its editorial policy is influenced by its advertising campaigns. The only reliable policy is to build a paper for its readers, else it will not be read, and will be of no use to advertisers. That spells ruin sooner or later. But a paper should not be misjudged by its readers, which is done at times. There are those who object to the illustrating and describing of new machines in a mechanical paper because of the advertisement to the manufacturer. There is no ground for such an objection, that is if the new features of the machine are of sufficient interest to the readers to warrant the use of the space such a description occupies. To a manufacturer the description of a new machine or mechanical appliance is of interest because it may be a factor in the reduction of manufacturing costs ; and to a mechanic it is of interest because the more he knows of up-to-date machines the greater will be his wage-earning capacity. But it must be confessed that there may be a tendency to deprave this department for advertising purposes, but if this is done it will leave its mark on the department, which cannot long escape notice. Then an injustice is being done the readers, and they have a legitimate right to object, but not until then.

SERIES OF ARTICLES ON PRODUCER GAS.

WE would direct the attention of our readers to the first of a series of articles which is appearing in this month's issue on "Producer Gas : Its Production and Application," being prepared for Canadian Machinery by Mr. Emil Stern, consulting and installing engineer for the Economic Power, Light & Heat Supply Co. Mr. Stern has very recently come to Canada from Germany, where he has been in close touch with producer gas plants and gas engines for some time, having latterly been associated with the firm making the Pintsch producer. This series of articles will include an historical sketch of the producer gas plant, a description of the various up-to-date plants made by prominent German, English, French, and American builders, and an article devoted to hints as to the running of a producer plant. Should this series prove of sufficient interest to our readers it will be continued, producer gas engines, their development and methods of present day manufacture, being considered.

MANUFACTURING PLANT TO SUPERSEDE WAREHOUSE.

THE Canadian Northwest is regarded as a grain-producing and cattle-raising section, and up to the present her needs in the way of manufactured goods have been supplied from Eastern Canada and the United States, consequently the cities of the west have been warehouse and distributing centres and not manufacturing centres. However, within the last year or so the west has started to manufacture for herself, and in this respect a very significant statement has been made by C. C. Ballantyne, president of the Canadian Manufacturers' Association, after a recent trip to Winnipeg. He said :

"The warehouse period in Western Canada will soon be a thing of the past. Factories are being erected and more sites for manufacturing concerns are being secured. It is only a matter of time before the west will make the greater part of her own goods."

Quite recently several eastern manufacturers have been negotiating with a view to starting manufacturing plants in Winnipeg, and also American firms. Of course the chief object of manufacturing in the west is to save freight rates from the east and extensive warehouse expenses, and although there are difficulties to be overcome in manufacturing in the west which are not so apparent in the east, the policy of some of the manufacturers in regard to establishing plants in the west seems to indicate an advantage.

The cost of power is an important consideration in the establishing of a good many industries, and the prospected hydro-electric power development in the vicinity of Winnipeg will be a drawing card for that city. Then, too, the tapping of natural gas at Medicine Hat will provide a cheap source of power for that municipality, and the citizens have great hopes of making an industrial centre of their town.

Canadian Manufacturers Convention'

THERE gathered at Winnipeg over 300 members of the Canadian Manufacturers' Association to attend the thirty-fifth annual convention which has been this year for a second time held in that city. The convention was opened with the usual addresses of welcome, which were ably responded to; after which the president, C. C. Ballantyne, delivered his presidential address in a forceful but pleasing manner. The convention being over a large number of the delegates are making a hurried trip through the western provinces.

President Ballantyne's Address.

Mr. Ballantyne opened with a reference to the large and satisfactory increase in Canada's foreign trade. The total trade was $73,046,000 in excess of 1904-05, the exports increasing $53,270,000 or some $20,000,000 more than the imports. A gratifying feature was that the imports of British goods had increased more proportionately than imports from the United States. The speaker attributed the exodus of young Canadians to the States to the lack of towns and factories, and the inducements and opportunities they afforded.

"To-day the situation is completely changed," he continued. "We have begun to study our own resources. What do we find? Not only that nature had fitted us to be a great agricultural nation, but that our mines, our forests, our streams and our waterfalls destine us to stand in the front rank of the manufacturing countries of the world; that here, within our own borders, we have all the raw materials for the world's great industries, the necessary industrial opportunities for all our sons and daughters, and the greatest and best market for the products of our farms. Our neighbors to the south have recognized this even sooner than we ourselves. To-day they are returning to us our own.

"It is for us to say whether we will continue to purchase our manufactured goods in the United States, or put just a little more tariff on certain lines, and make the factories in the States build plants in Winnipeg, Saskatoon, Moose Jaw, Calgary, Medicine Hat, Regina, Edmonton or any other of the many centres in our great western prairies which have advantages to offer, and by this means keep the population we are getting. Last year our dutiable imports from the United States amounted to $94,200,167, the large percentage of which was manufactured goods, and might just as well have been made in Canada. As it is, the United States farmers, workmen, manufacturers and other citizens have just that much of our money that should have been kept at home.

The Fiscal Policy.

"It must be a matter of gratification to all patriotic Canadians that the fiscal policy has ceased to be a matter of partisan controversy. The leading politicians of both political parties now recognize the necessity of protecting Canadian industries of all kinds, and we may hope that when the members of our Dominion Parliament are called together in November to consider the revision of the tariff they will set aside all old prejudices and look at the question from the broad standpoint of Canadian interests, that they will consider what policy will best develop the varied resources of our country, give profitable employment to all classes of our people, and maintnin and advance the prosperity that now exists.

C. C. BALLANTYNE, of the Sherwin-Williams Co., Montreal, Retiring President of the Canadian Manufacturers' Association.

"We are sometimes asked what we mean when we say Canadian manufacturers do not demand a prohibitive tariff against the United Kingdom, but that we must at least have sufficient protection to put our Canadian manufacturers on an equivalent footing with those of Great Britain. Perhaps our meaning may be better understood when I cite the case of one of the members of our association who had large factories in Montreal and London, England. The difference in the wages paid in these two great factories of England and Canada is remarkable. Figures taken from the pay rolls, and strictly accurate, show that common labor is 82 per cent. higher in Canada than in England, gang leader or sub-foreman 70 per cent. higher, boys (16 to 18) 85 per cent. higher, machinists 64 per cent. higher, carpenters 40 per cent. higher, girls (by the hour) 33 1-3 per cent. higher, and girls (piece work) 66 2-3 per cent. higher.

"Are not these figures alone sufficient to show the necessity of maintaining an equalizing tariff against British goods? But if, while giving our manufacturers fair play in competition with British manufacturers, we make our tariff so high against all foreign countries that our surplus requirements, above what our own factories can supply, will be obtained from British manufacturers, a vast amount of money which now goes to enrich foreign nations will be turned into the pockets of British manufacturers and their workingmen."

Western Possibilities.

Mr. Ballantyne referred to a memorial presented by the Medicine Hat Board of Trade to the Dominion Tariff Commission to the effect that if the tariff were high enough to shut out the great influx of American goods, many United States manufacturers would start branch factories in Medicine Hat. The latter would not be the only town in the west to benefit by this policy. The possibilities of Winnipeg it would be difficult to exaggerate.

"To accomplish this," the president proceeded, "we want a strong Canadian policy that will benefit both east and west. What action the Government will take at the coming session of Parliament we cannot say, but we believe that the Government will give us the best and strongest Canadian tariff that we have ever had, and one that will give thorough protection to every Canadian industry."

Flaxseed was referred to as an article of great importance to the farmers of the west, but owing to its being on the free list was not produced to any great extent. The United States farmer pro-

duced 29,000,000 bushels of flaxseed during the last fiscal year, compared to a little over half a million bushels in Manitoba and the Northwest Territories, which are better adapted for its growth than any country in the world. Canadian flaxseed was shut out of the American market on account of a duty of 25 cents per bushel. Under these circumstances he asked: "Why do not our Canadian farmers ask our Government to place a duty on flax entering Canada and thus give them the home market which they are justly entitled to? There is from a million and a half to two million bushels of flaxseed consumed in Canada annually by our Canadian linseed oil crushers, and why should a million bushels or more of foreign seed be used instead of buying 'Grown in Canada' flaxseed, and grown right here in the west, the best that can be produced?

Canada's Varied Resources.

"Resources of every kind are at our hand. The mines, the forests, the seas, the farms and factories of Canada are all beckoning labor and enterprise from every part of the globe, offering not only healthy conditions and comfortable homes, but a citizenship which, in the freedom of its thought and institutions, is as broad and free as our great dominions themselves.

"Great as these resources are, they are all enhanced by our splendid position in the empire and the world of commerce. Nature has destined us to be a great producing country. Let us not forget that we possess the shortest routes to Great Britain on the east and the Orient on the west. We lie between the east and the west. We hold the strategic position in time of war, and we will hold the commercial supremacy in the time of peace. In the great Imperial preferential movement to which we are moving on, and in the commerce of the world, Canada must play an important part, and the life of this great association must be woven into her development from year to year.

"What a great task; what greater opportunities! To develop all our industries hand in hand, to cultivate and maintain a national co-operation between our now scattered provinces, to weld and strengthen the bonds which bind us to the other portions of the Empire, and all the while to keep pure and healthful our moral and political life. If we are faithful to the trust imposed in us we need have no fear of the future."

Mutual Insurance Endorsed.

The mutual insurance committee's report was particularly interesting. The action taken in adopting it and choosing provisional directors for the two companies to be organized was probably the most important work of the whole convention.

"It is almost impossible," the report said, "to present a statement that will convey an intelligible appreciation of the results of the work thus outlined, so much of it being intangible and difficult to place under any given heading, but in so far as a record is possible it may be thus summarized:

"(1) 146 insurances arranged and new schedules printed.

"(2) Direct annual saving in insurance premiums of $17,904.91, through improving risks or rearranging business.

"If the facts point to any conclusion at all it is in emphasizing the belief prevalent amongst manufacturers in Canada that the losses sustained by them in recent years do not warrant the high rates they are charged. Statistics are not available to make this belief an absolute certainty; the fire insurance companies themselves are the only source from which such figures can possibly be obtained, and, as they have never yet supported the contention so often repeated that 'Your class of risk does not pay' by the production of any confirmatory evidence of actual results, we can only accept the best evidence obtainable and form our opinion and judgment accordingly."

The failures of negotiations with the Fire Underwriters for permission to place risks with independent companies was recorded, and the necessity of ceasing to do a brokerage business with tariff companies pointed out.

Two Mutual Companies.

The report then referred to the executive council deciding to establish two mutual companies for the underwriting of risks in the senior and junior mutuals and of sub-standard risks on the lines of companies forming the National Association of Factory Mutuals.

In reply to communications to members 301 return agreements duly signed promising definite support to the proposed companies in sums varying from $1,000 to $100,000.

Thirty-four write approving the formation of the companies, and promising full support when organized if conditions are satisfactory.

Seven write discouraging the formation of the proposed companies.

"The 301 members sending definite agreements promise an aggregate insurance in each of the two companies of $2,371,000, of which about $1,250,000 will be available at the outset. Adding support from the members who have written, but who have not signed definite agreements, it is quite apparent that the two proposed companies will have at inception a minimum available insurance of at least $1,500,000 in each company, or three times the sum upon which it was thought the companies might safely commence operations.

"The committee, therefore, recommended that this meeting approve the continuance of the insurance department under plans to be approved by the executive council from time to time, and that the finance committee be authorized to provide whatever deficiency may arise in the expenses over the revenue of the department under such limits and restrictions as it may deem advisable.

"The revenue of the department for the year has fallen short of the expenses of the same period by $873.19."

Changes in Law Wanted.

It was recommended that the association ask for a change in the Insurance Act of Canada, to provide for:

(1) The incorporation and licensing of mutual fire insurance companies.

(2) The adoption of a paid, definite, and invariable standard insurance policy, protecting both the interests of the insurer and insured.

(3) The rejection of the aggregate liability assumed by fire insurance companies in cities and towns, so that in the event of large conflagrations the amount of such aggregate liability may be within the resources of the company to discharge.

The membership of the association was reported at 2,104, as compared with 1,839 last year. Of this total 1,257 were in Ontario.

P. H. Burton was named as chairman of the Toronto company and J. H. Burland chairman of the Montreal company.

Election of Officers.

The election of officers resulted as follows: President, Mr. Harry Cockshutt, Brantford, (acclamation); vice-president, Hon. J. D. Rolland (acclamation). Provincial vice-presidents were elected as follows: Ontario, Lloyd Harris, Brantford; Quebec, J. A. Vandry, Quebec; British Columbia, John Hendrie; Manitoba, L. C. McIntyre; New Brunswick, Chas. J. Macdonald; Alberta, A. E. Cross, Calgary; Saskatchewan, E. J. Brooks, Regina.

The next place of meeting will probably be Vancouver.

Friendship, like everything else, is tested by results. If you want to know the value of any friendship, you must ask what it has done for you and what it has made for you.—James Stalker.

ABOUT CATALOGUES

By mentioning Canadian Machinery to show that you are in the trade, a copy of any of these catalogues will be sent by the firm whose address is given.

Gas and Gasoline Engines.—Neat little catalogue issued by the Toronto Gas & Gasoline Engine Co., Dufferin street, Toronto, illustrating and describing their engines.

Alundum Grinding.—A leaflet issued by the Norton Emery Wheel Co., Worcester, Mass., describing "alundum," the material they are now using in the manufacture of their grinders.

Gisholt Lathes.—A sheet for the Gisholt Machine Co., Madison, Wis., reference book, illustrating and describing the 34-inch Gisholt turret lathe, specially designed for a railroad shop.

Armstrong Tool Holders.—The general catalogue and price list of Armstrong tool holders for all classes of work issued by Aikenhead Hardware, Limited, Toronto It is a neat size, 6 x 3 1-4 inches.

Canadian Lock Nut.—General catalogue of the Canadian Lock Nut Co., Limited, Pearl street, Toronto, illustrating and describing their locking nut. The work on the catalogue throughout is very fine.

Pumping Machinery.—Bulletin No. 4 of the Smart-Turner Machine Co., Limited, Hamilton, illustrating and describing their automatic feed pumps and receivers and their independent jet condensing apparatus.

No. 2 Plain Milling Machine.—Descriptions and specifications of No. 2 heavy plain milling machine, recently placed on the market by the Brown & Sharpe Mfg. Co., Providence, R.I. The catalogue is an exceptionally handsome one.

The Cushman Motor.—A booklet illustrating and describing the Cushman gasoline motors, marine and stationary, made by the Cushman Motor Co., Lincoln, Neb. The motors are very neatly illustrated and are described in detail.

The Jamestown Exposition.—A little booklet dealing with some features of the coming world's exposition to be held in Jamestown, Virginia, during 1907. It may be obtained by application to the exhibition authorities at Norfolk, Va.

Plain Milling Machine.—Catalogue of descriptions and specifications of No. 1 1-2 Brown & Sharpe plain milling machine, which is an addition to their line of plain milling machines, sent out by the Brown & Sharpe Mfg. Co., Providence, R.I. Size, 6 x 9 inches.

The Harris Patent Power Hoist.— A catalogue 6 x 9 inches, descriptive of the Harris patent power hoist and carrying machine, made in the United States by the C. S. Harris Co., Rome, N.Y., and which will be made in Canada by W. R. Perrin & Co., Toronto.

Bickford Radial Drills.—The 1906 radial drill catalogue of the Bickford Drill & Tool Co., Cincinnati, O. This catalogue is 6 x 9 inches and contains 41 pages. It is an exceptionally handsome catalogue, the illustrating and typographical work being of a very high order.

Nut Standards.—Bound specifications and drawings of the new standards for bolts, nuts and screws which have been adopted by the association of Licensed Automobile Manufacturers, 7 East Forty-Second street, New York. The matter is prepared in quite an elaborate style.

Lighting of Public Buildings—Is the title of a catalogue issued by the Westinghouse Co's publishing department, Pittsburg, illustrating and describing some installations of the Nernst lamp for the lighting of public buildings. The catalogue is 6 x 9 inches and is well illustrated.

The Hanna Riveter.—Catalogue No. 3. 1906, edition of the general catalogue of the Hanna Engineering Works, of Chicago, describing and illustrating different styles of the Hanna pneumatic riveter. The catalogue is gotten up in an original style, and is a handsome, well-illustrated one.

Expanded Metal.—An interesting paper published by the Associated Expanded Metal Companies telling of expanded metal concrete in the San Francisco disaster. The paper is profusely illustrated. A copy can be obtained from the Expanded Metal & Fireproofing Co., 100 King street west. Toronto.

Campbell Gas Engine.—A catalogue of the Campbell gas engines and suction gas producers gotten out by the Campbell Gas Engine Co., Limited, Halifax, England, illustrating and describing these engines and gas producers. A copy of this catalogue may be obtained from Wayland Williams & Dadson, 821 St. James street, Montreal, or from the Producer Gas Co., 11 Front street east, Toronto.

Sturtevant Economizer.—Bulletin No. 132, in the engineering series issued by the B. F. Sturtevant Co., Boston, Mass., illustrates and describes Sturtevant economizer installations in the power houses of the Interborough Rapid Transit Co., the New Orleans Railways Co., the Boston Elevated Railway Co., the South Covington and Cincinnati Street Railway Co., and the Burlington Municipal Electric Lighting Co.

BOOK REVIEWS.

The Management of Electrical Machinery.—This is a thoroughly revised and enlarged edition of "The Practical Management of Dynamos and Motors," by Francis D. Crocker, E.M., Ph.D., and Schuyler S. Wheeler, D.Sc., published by D. Van Nostrand Co., 23 Murray street, New York. Price $1.00. This book is 5 1-2 x 6 1-2 in. in size and contains 223 pages inclusive of the index. A complete revision of the former book was necessitated by the rapid progress of electrical engineering during the time since its publication. The arrangement and object of the matter in this edition is practically the same as that of the former edition, with the exception that a good deal of obselete matter has been eliminated.

An idea of the class of matter contained in this book is best understood from a review of its contents. It is divided into five parts, the first part deals with the selection and management of dynamo electric machinery including a review of the principles of generators and motors, installation of machines, foundations, and mechanical connections, the operation of generators, and the connections and operations of motors; part two deals with the inspecting and testing of the machines, including a consideration of adjustment, friction, balance, noise, heating and sparking, electrical resistance, voltage and current, speed and torque, and power and efficiency; part three deals with the localization and remedying of the numerous troubles which may be had with electrical machinery; part four takes up the consideration of constant current generators, including a description of the several types; part five deals with the management of railway motors.

To anyone having anything to do with the installing or operating of electrical machinery, this book should prove of exceptional value as a text book and also as a book of reference, because of the practical standpoint from which all problems are considered by the authors.

Milling Cutters: How They are Made, Used and Abused

By John Edgar

ARTICLE V.

MILLING cutters could not be treated in a complete manner without some mention being made of the special forms which have become commercial, in that they may be found in any well-kept stock, which has any pretentions of being complete. The very fact that it is possible to obtain on short notice such cutters make a description of them and their uses of great value to any who attempt to keep posted in milling machine practice.

In this article these cutters will be described and their use explained, bringing out points which may prove of value to users of them.

In the tool room use will be found for this class of cutters in the general run of work, as they are used in the production of tools peculiar to this department such as taps, reamers, drills, and other tools.

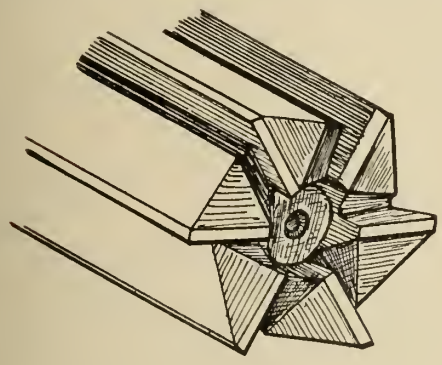

Fig 22.

"Centre Cut" End Mill.

A class of work that gives considerable trouble is that of milling slots from the solid metal, slots such as the drift-holes in collets or the roll grooves in cams. These slots are of such a nature and in such a position that it is impossible to mill them with the plane milling cutter, which cutter gives the best satisfaction wherever it can be used to advantage, but resource must be had here to the end mill, which when made in the ordinary manner does not act very well on account of its slow cutting properties and the clogging effect the chips have. Much better results are obtained by the use of the "centre cut" end mill, a sketch of which is shown in Figure 22. As will be seen, there is a large recess in the end of the mill, which allows the cutter to cut better when sunk into the work; but of course the depth of this sinking cut is limited to the depth of the recess. When the cutter is brought to the limiting depth it is fed along the work producing the slot to this depth, the

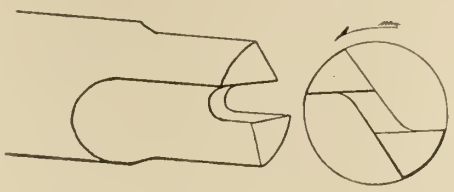

Fig 23

operation being repeated until the required depth of slot is obtained. These centre-cut end mills are also preferred by many for all work where an end mill can be used, and are undoubtedly better on cast iron on account of the much coarser teeth they have.

The "Cotter" Mill.

Another cutter that is much used and is preferred by many to the centre-cut end mill for milling slots, is that known as a "cotter" mill. This mill is illustrated in Fig. 23. It is used in the same manner as the one previously described. It has only two cutting teeth and these are given a very keen rake, which is of great value, since all the cutting is done by the end of the teeth. In sinking this cutter into the work there is produced a core which is removed when the cutter is fed along by the inner cutting edges of the teeth.

Gear Teeth Millers.

Probably the most familiar standard "formed" cutter is that for cutting the teeth of gears. These cutters are made according to two different systems of curves, the epicyclodial and the involute, the former being but little used in general machine work on account of the accuracy required in the preparation of the gear blanks and the centre distance of the shafts on which the gears are to be used. The latter has not these disadvantages, and the form obtained answers all the purposes of general practice. Gear cutters are also made to correspond to the two different styles of designating the pitch of the tooth, viz., the circular pitch and the diametral pitch. The circular pitch is used only is very rare cases where cut teeth are used, while the latter is almost universally used. Cutters made according to the metric system are numbered or designated as to pitch by the fraction

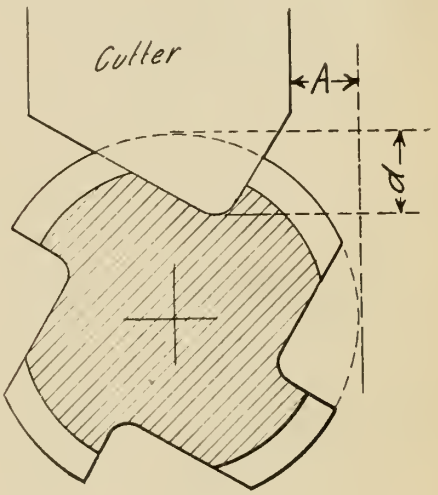

Fig 25

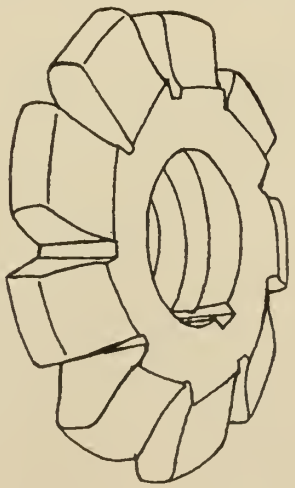

Fig 24.

produced by dividing the diameter in millimeters divided by the number of teeth. This fraction is called the "module."

Gear cutters are made in sets covering the range of wheels having from twelve teeth to the rack, and are ordinarily made with eight cutters to the set, ranging as shown in the following table:

Table V.

No. 1 cutter will cut wheels of 135 teeth to rack.
No. 2 cutter will cut wheels of 55 teeth to 134 teeth.
No. 3 cutter will cut wheels of 35 teeth to 54 teeth.
No. 4 cutter will cut wheels of 26 teeth to 34 teeth.
No. 5 cutter will cut wheels of 21 teeth to 25 teeth.
No. 6 cutter will cut wheels of 17 teeth to 20 teeth.
No. 7 cutter will cut wheels of 14 teeth to 16 teeth.
No. 8 cutter will cut wheels of 12 teeth to 13 teeth.

Some manufacturers are prepared to furnish cutters in half numbers, which still further reduce the range cut by any single cutter, but for general work the regular set of eight answers all the requirements of good practice. Figure

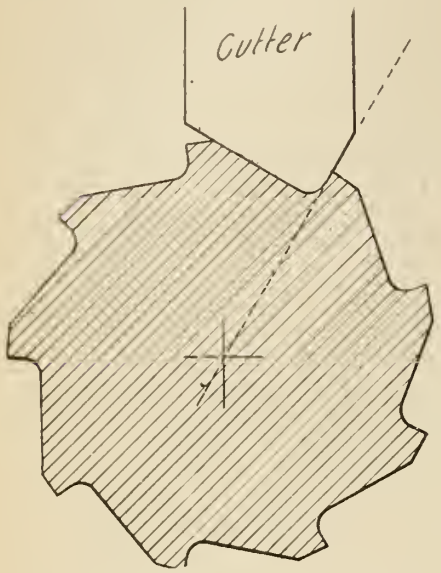

Fig. 26.

24 shows an illustration of one of these cutters.

Millers for Fluting Tops and Reamers.

A style of cutter for which there is much use in the tool room, is that used for fluting taps and reamers. Of these cutters there are several styles. Figure 25 shows the shape of a combination tap and reamer fluting cutter. Figure 26 shows the sectional view of

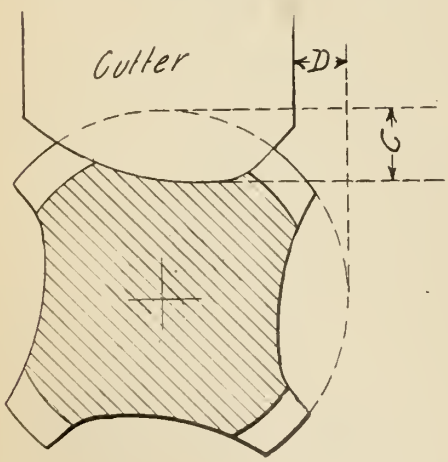

Fig 27

a reamer produced by this combination cutter, where comparatively few taps and reamers are made. This cutter will appeal to the buyer, as very good results are obtained at small expense. For use on taps, Brown & Sharpe give the figures shown in Table VI for the setting of the cutter relative to the blank. These cutters are made in sets of eight cutters, and are numbered numerically from 1 up, and take in a range of taps from ⅛ in. diameter to 2 in. diameter.

Table VI.

Data for setting combination tap and reamer cutters for fluting taps :

Dia. of tap.	No. of cutter.	A.	d.

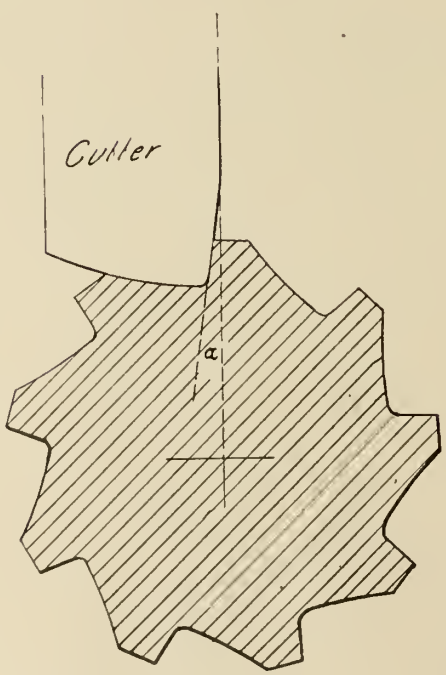

Fig. 28

In using the above figures it must be remembered that the tap must be cut with four flutes, as the data does not apply to any other number.

In cutting reamers it is left to the judgment as to the position of the cutter, it being possible to vary the number of teeth in the reamers; and the position of the fluting tool also determines whether the reamer has a clean

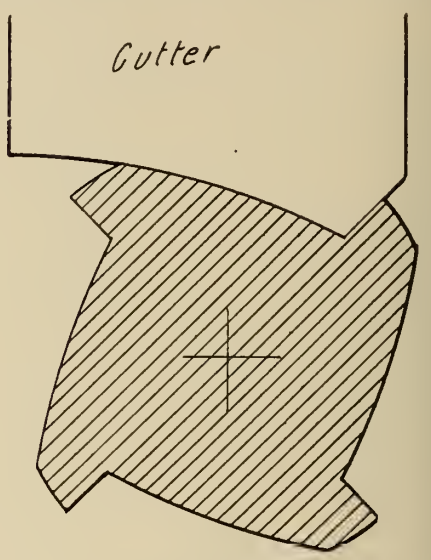

Fig 29

cutting action or the scraping action necessary in the reaming of brass and other soft compositions.

Special Cutter for Fluting Tops.

The best practice in design necessitates a specially shaped fluting cutter. This cutter is shown in Figure 27. This design makes a much stronger tap, as it does not remove so much metal from the centre of the tool. Data for setting this cutter is given in Table VII, obtained from the same source as the foregoing table.

Special Cutter for Fluting Reamers.

A cutter especially designed for fluting reamers is shown in Figure 28, and this cutter, when set as shown, will mill a flute giving the face of the tooth a negative rake which has the scraping action mentioned above. This rake may vary from 5 to 10 degrees, but is made on standard cutters about 8 degrees. This cutter produces a very good looking reamer, as will be seen from the cut.

Figure 29 shows a cutter for milling four lip twist drills, such as are used for drilling out cored holes. These drills are nearly always made with spiral flutes, the angle of spiral being from 15 to 30 degrees.

In Figure 30 we have shown the cutter used in grooving twist drills. This is a special shape which produces the straight lip drill, shown at the left of the figure. For small drills an ordinary circular-shaped cutter is used, and it answers the purpose very well; but for drills of larger sizes the cutter shown in Figure 29 should be used.

As mentioned above, these cutters are all "stock" cutters, and can be obtained on short notice.

Should They be Bought or Made.

It is always a question with the user of milling cutters as to whether it is better to buy or make them. There is but little doubt that milling cutters, such as are listed as standard cutters, can be bought more cheaply, and that a better grade of cutter can be obtained from makers of milling cutters than can be had in "home-made" tools. Why? For the very reason that manufacturers have special machinery at their disposal, and they are also familiar with the grades of steel used, so that the best results are obtained in both making and hardening the cutter. When we consider special cutters, it is a different matter, and whether it is cheaper to buy or make is dependent on the equipment the user has on hand, and upon whether the cutter is wanted immediately or not. It is wholly a matter that must be decided on the spot.

Last of Series of Articles.

This article is the last of the series, and it is to be hoped that the object of the series has been obtained, and that the reader has at least reaped as much benefit in reading as the writer has in the preparation of the several articles. It has not been the object to give more than a glimpse at the subject, merely familiarizing the reader with the ordinary run of practice in the art of milling.

Zinc and its Manufacture

IN a recent address before the Metallurgical Society at University of Birmingham, Eng., Professor Turner said there was no ancient metallurgy of zinc. It was the last discovered of the common metals. It possessed several peculiar properties, and one of the most remarkable at the present time was that it was not chiefly made in America. It was manufactured on a considerable scale in England, largely from British ore.

Zinc was first mentioned by Paracelsus in 1530, so that its history was comparatively recent, but as a matter of fact, it had been accidentally produced earlier on a number of occasions. It was not recognized, however, as a separate metal. In the ruins of Cameros, destroyed about 500 B.C., a girl's bracelet made of zinc was discovered. Up to the end of the sixteenth century zinc was only used on a small scale, and was brought from China and India. In 1625 Glauber knew that zinc could be produced from calamine, which was sometimes nearly white, but was generally colored. Calamine had been used for brass making in Birmingham, where the brass houses that used to stand in Brasshouse Passage were taken down less than a century ago.

Henckel in 1721 was stated to have been the first intentionally to make zinc, and of all western peoples the British first manufactured zinc on a large scale. A Scotchman named Lawson went to China and found out how zinc was made there, and on his return to England works were set up in Bristol in 1740 by Champion, and for some time England was the chief zinc-producing country in the world.

The process of extraction was very costly at first, and zinc sold for as much as ten times its present price. Zinc manufacture was introduced into Belgium by Douy a hundred years ago, and into Silesia by Ruhberg, who had learnt the process whilst on a visit to England. These processes continued side by side with but little improvement until about 1865, when gas-firing was introduced, from which time dated the really modern metallurgy of zinc. The various improvements introduced since then included the extended use of blende as a source of zinc, the more efficient preparation and concentration of ores by magnetic concentrators, oil processes (especially with the recent improvements with the use of the vacuum), and the flotation process by means of acidulation such as was used in the Broken Hill district. After referring to improvements in calcining-furnaces, especially those with multiple beds, and mechanically stirred, Professor Turner described in detail the Merton calciner, which has recently done excellent work with zinc ores. He also described other modern developments such as the introduction of gas-firing, including the use of natural gas, and of hot gas from producers attached to the reducing furnaces.

It was the introduction of natural gas in the Kansas industry that had brought the United States so much to the front in zinc manufacture in recent years. Professor Turner said that although he was very much impressed with the order, economy, and skill displayed in Belgium, he felt that the modern process of making zinc was not the best.

Positiveness is a virtue. It is well to have opinions of our own if they are well matured, and to hold to them with firm and tenacious grasp. A man with no opinions is sadly wanting in the quality of manly character. He never can be a force or an influence in the community. One must stand for something and people must know where one stands.—Busy Man's Magazine.

THREE-INCH PUMP VALVE TOOLS.

FIGURE 1 shows a 3-in. valve seat for the discharge heads in a large pump; and having three hundred of these to machine, we made the following tools in order that the job might be facilitated. Figs. 2 and 3 show the construction of the box tool, which is made of cast iron, and which is supplied with a machine steel shank. The cutters are easily adjusted by the screws, as shown in the sketch, and are made from $\frac{1}{4}$ in. to 1 in. steel. Figs. 4 and 5 show the die in detail, the body being of cast iron, with an inserted machine steel shank. The slots for the dies are machined, and a keyway 1-16 in. x $\frac{1}{8}$ in. is cut down the centre to locate the dies accurately, which is shown at (A), Fig. 5. It is easily adjusted for diameter by the screws, the dies being made with a raised piece on them to correspond with the slot in the holder. Before the dies are set for cutting the thread in the valve seat, a piece of .010 sheet iron 1-16 in. wide is inserted behind the dies at (B), Fig. 4; this provides for a clearance when the die is hardened and placed hard up against the holder ready for use. Figs. 6 and 7 show the box tool for turning the shanks and facing the seat, and also for cutting the shank to length. The first cutter, Fig. 7, turns the shank to size and allows it to pass into the box of the holder, coming in contact lower down with the second cutter which turns the smaller diameter on the shank. The inserted tool for facing the end to length is seen in Fig. 7, and also in the elevation, Fig. 6. The tool faces off the end until the seat is perfectly machined by the top cutter. All the cutters are easily adjusted by the screws. The body is cast iron with an inserted machine steel shank. The lines running at an angle shows the slot cored to that point to allow the cutter to be withdrawn. The first operation in the machining at the valve was to turn and thread the large end using the tools in Figs. 2 and 4, which are there shown in elevation and in a plane view in Figs. 3 and 5, the small end being chucked with the three arms supported by an extended piece from the chuck. The edge is first chamefered and then the box tool, Figs. 2 and 3, is put over it, finishing the outside diameter of the threaded part, and at the same time facing and turning the collar; the die is then run over it, which completes the operation. The second operation is to screw the valve into a master chuck and turn the shank, and face the seat, which was done with the tool in Figs. 6 and 7.—F. E. Lauer, Plant Superintendent, Dominion Henderson Bearings, Toronto.

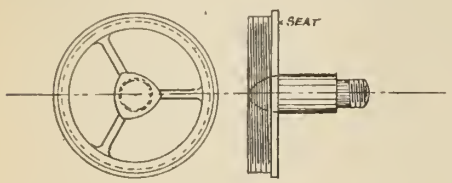

FIG-1

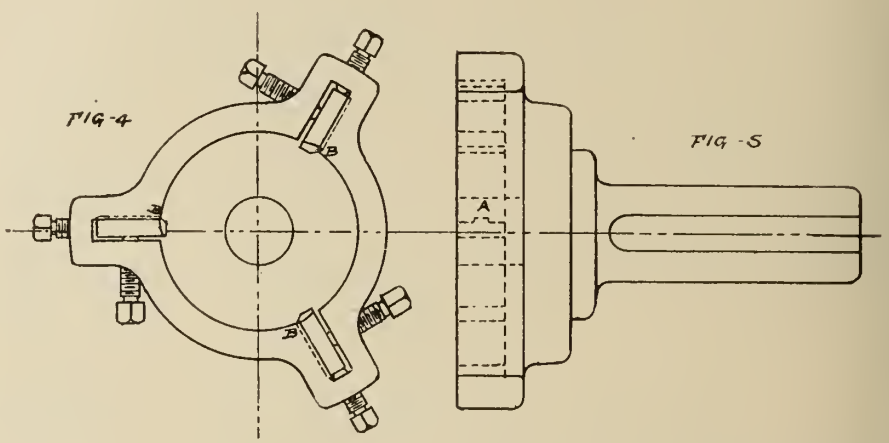
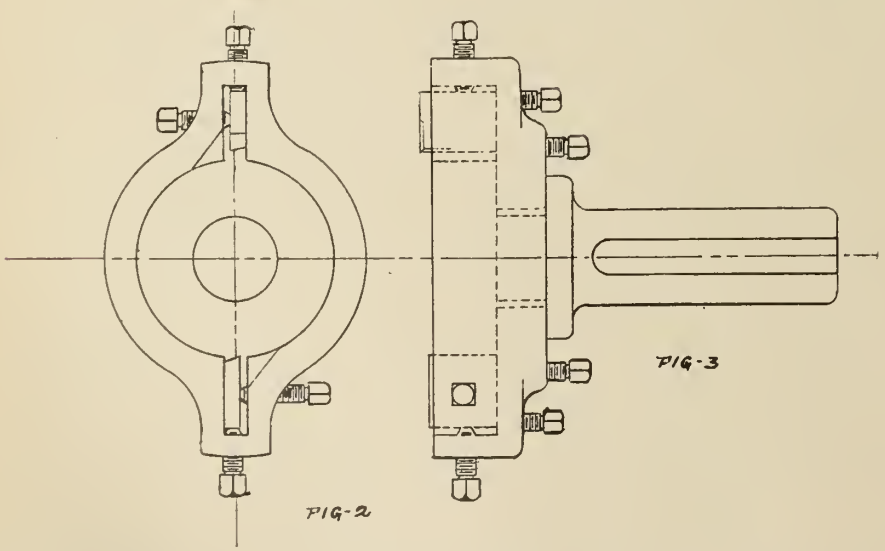




SYSTEM IN KEEPING TOOLS.

IN reading over the article on the above subject which appeared in "Tricks of the Trade" column in the September issue, it occurred to me that "J.C.A." has rather too much "red tape" about his tool room system, and it might prove of interest to suggest one which would be much less complicated and which is proving very successful in shops which I know.

The tools are arranged in the tool room, each tool having its place. Upon entering the employ of the company each machinist is supplied with a certain number of tool checks, which are his property as long as he remains with the firm. When he wishes a tool from the tool room he deposits one of his checks in place of the tool, and at one time he can have as many tools out as he has checks, and no more. The door of the shop is kept continually locked, with someone there to give out the tools and take in the checks, and look after the tools generally.

In some shops I have been in the door of the tool room is left open and each man gets the tools himself, and deposits the check himself, but this has not been satisfactory, because under these conditions too much is left to the honesty of the machinist, and the chief value of the system is lost. In starting a tool room system the locked door

system in the only one, but the changing from an open door system to a locked door system is sometimes hard, especially in a shop where the machinists have been in the employ of the company for a long time.—Machinist, Toronto.

WAIT BUT WORK.

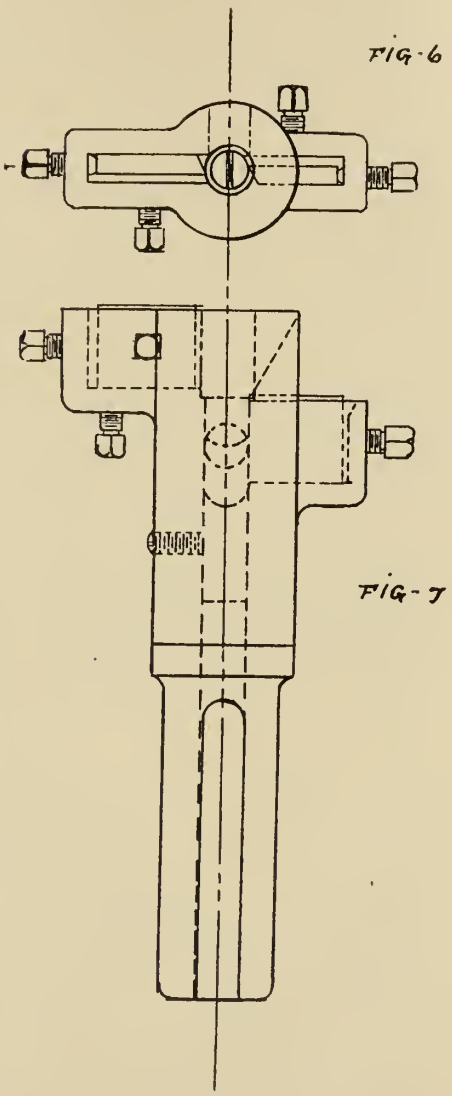
"ALL things come to him who waits," but the waiting must be done actively and not passively. This statement might, with reason, be revised to read: "All things come to him who waits and works." Some may take exception to this statement thinking that, while the waiting and the working are important considerations, cleverness is too important a factor not to be included. It is true that quickness of perception means a great deal to a person, but the cleverness of the cleverest person will not bring him position unless he has an aim, and works hard to accomplish that aim; and sometimes a supposedly dull person has as good a chance of reaching the desired position, because he has perseverance and the ability to work.

The law of compensation is noticeable on every hand; every person has characteristics which help him on and others that keep him back. In nine cases out of ten the very bright and clever person lacks the ability to apply himself unreservedly for any time, and this is as great a drawback to him as lack of quick perception is the dull person. It is natural that lack of stick-to-itiveness should be developed in a person who picks up his education quickly and easily, and that a dogged perseverance should be developed in one who has to work hard for all he gets.

The fable of the hare and the tortoise is no fable, but an axiom of life. Instances every day prove that a person with the right kind of ambition starting out handicapped leave a more lasting impression in the world than a person with the same ambitions, but in whose way there are no rocks. It is the overcoming of obstacles that develops strength of purpose.

This all goes to show that every apprentice in any machine shop has a legitimate right to aim to become foreman, or one of the foremen, of that shop, or to become draughtsman, or to secure some other position of responsibility; and that every machinist in a machine shop has a legitimate right to aim to better his position in the shop. Of course every one cannot be a superintendent, a foreman or a draughtsman, but to each individual this competition should prove an inspiration, nor will he who shrinks from competing with all ever win out. It is for each competitor to wait and work, and the way to work is to fill the present position in such a way as to prove to the superintendent one's ability to fill a more responsible one. Then, when there is a responsible position vacant, the superintendent will know whom to recommend.

The more interest a machinist puts into his work, the more pleasure he will derive from it, and the more he will feel like improving himself. In these days the machinist, if he wishes to rise, cannot be content with the knowledge he picks up during working hours. The advances in the processes of manufacturing of recent years have been the result of the increased application of scientific and technical knowledge, and the machinist of to-day must take advantage of the many opportunities given him of improving himself along these lines. The machinist who reads, with the idea of making himself a better mechanic, as much literature bearing directly on his line of work as he has time for, will have little trouble in keeping ahead of the machinist who depends entirely upon personal experience for his knowledge. Of course only he who is ambitious and who likes his work will spend much of his own time in improving himself. However, if success is to be attained one must court success with all one's might, and therefore it is that the ability to centre one's interests and work hard along that centre is the chief qualification to success. W.A.F.



THE WASTEFULNESS OF CHIMNEY DRAFT.

IN a discussion of the methods for the utilization of waste heat, the wastefulness of the usual method of producing draught by the ascent of heated air in a chimney must be considered.

Taking the boiler as the wasteful member in a steam plant, its efficiency varies from 60 per cent. in a bad boiler to 80 per cent. in a very good one, these proportions of the heat produced by the combustion of the coal being realized in steam available for the engine in each case.

The difference may be said, without greatly stretching the truth, to go up the chimney. It is not to be disputed that much of the waste heat might be caught and utilized, but there are reasons why it is not so caught. In the first place, the gases must be hot when they go into the chimney, or there will not be a draught.

As a matter of fact a draught got in this way is the most expensive possible, save one. The exception is a steam jet in the chimney. A fan can be run for about one-tenth of the power represented by the waste heat required to command a good draught. A tall chimney will cost from $5,000 to $25,000—very much more than will a fan plant. But the fan is not used and the chimney is, largely because it is essential to discharge the products of combustion high up in the air over the roofs of surrounding houses. This necessity must be taken into consideration in so far as factories are concerned, but it does not hold good of steam ships, yet we believe that in some cases a chimney stack 100 feet high would be sufficient, because with a fan combustion could be more easily controlled than is possible with a chimney, to the end of preventing the giving off of smoke.

Theory without practice is like experience without judgment, and theory without judgment is not likely to be worth much in practice. Theory in practice will work out in harmony and accomplish the desired ends, just as judgment and experience will do when combined; in fact, they are practically the same. Theory shows one side—practice shows the other, and neither is complete without the other.—The Woodworker.

Mechanical Reviews

OPINIONS AND STUDIES WORTH NOTING

AN IMPROVED PLANER DRIVE.

THE accompanying table shows how wasteful of energy is the ordinary pully rim of a planer, the size of planer taken for illustration being 84 x 66-inch x 17-foot stroke.

Fig. 1 illustrates a new type of drive, designed to largely reduce the waste of energy required to accelerate the moving parts of a planer, and bring them to rest at each end of the stroke. This is accomplished by arranging the driving pulleys so that the driven pulley may be reduced to one-half the usual width; in other words, to the width of a single belt. The pulley (A) driving the planer on the return stroke, is smaller than the pulley (B), which drives the planer on the cutting stroke, and is placed on a direct line between cutting pulley (B) and the planer pulley (C). This allows the return belt to occupy the position left by the cutting belt, and vice versa.

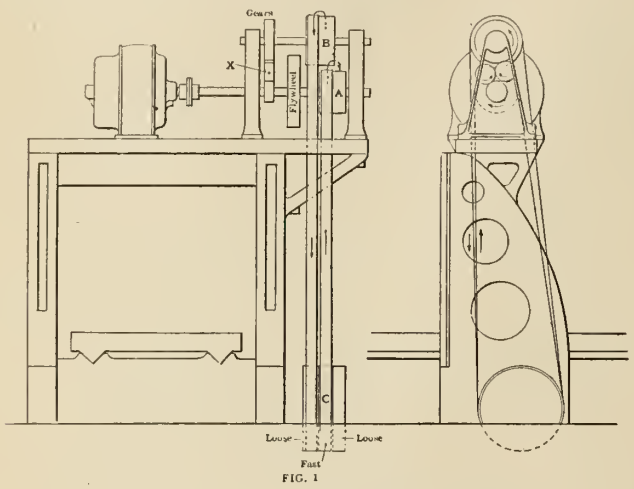


FIG. 1

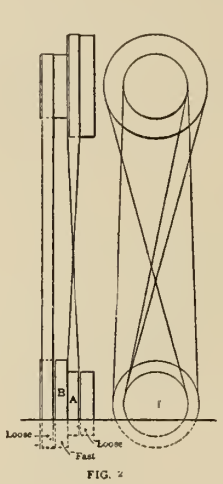

FIG. 2

A Improved Planer Drive.

Fig. 1 shows the planer equipped with a motor drive but it could easily be adapted for belt drive. The improved drive would be especially advantageous to planers equipped with an independent motor, for the size of motor is usually determined by the load due to continually reversing when the planer is working on short strokes, and not by the cut. The saving in the cost of the motor would pay for the extra cost of driving gear. The planer could have variable speeds by inserting change gears at (X).

Referring to the table, the figures in column 1 are taken from an up-to-date planer of 1904. The driven pulley is 10½ inches wide, the belt being about 4½ inches. The cutting belt works on one-half of the pulley, and when it is shifted, the return belt is moved onto its other half. The difference of speed between cutting and reversing is obtained by a difference of belt speeds obtained by overhead pulleys.

Column 2 gives the figures worked out for the same planer, but the improved drive illustrated in Fig. 1, and shows a saving of 28 per cent. in the total ing parts at the end of each stroke, and as the square of the velocity. Therefore, if the planer under consideration therefore a reduction of about 20 per cent. in the size of motor required.

Column 3 shows the figures worked out for the same planer, but using slower belt speeds, the driven pulleys being reduced from 3 to 2 feet daimeter, but increased in width from 5½ to 7½ inches to give about the same driving power, the revolutions per minute remaining as before and the drive being of the improved type as shown in column 2 and Fig. 1. This column of figures brings out very forcibly the advisability of keeping down the belt speeds to a moderate figure, and shows the great waste of energy often resulting when speeding up existing planers by simply increasing the speed of the belts, by putting larger pulleys on the line shaft.

The wastefulness of high belt speeds is aggravated somewhat in the case of a planer with pulleys arranged as illustrated in Fig. 2 and worked out in column 4. With this type of drive the highest belt speed is obtained with the belt on pulley (A), when the table is returning. If the speed of the belt on pulley (A) be 3,900 feet per minute, then the speed of the rim of pulley (B) when running idle, will be 5,200 feet, the energy in a moving body going up

FIG. 3—An Improved Planer Drive.

were equipped with this type of drive, it would require 24 per cent. more energy to accelerate moving parts than would be the case of a planer equipped with ordinary drive worked out in column No. 1.—W. H. Henley, in American Machinist.

CAST IRON GAUGES.

IN making up large plug gauges it is a usual custom to make them out of tool steel, hardened and ground, but I find that fine grey iron, carefully turned and ground, gives good satisfaction and lasts a long time; besides cast iron lends itself to cored construction which lightens the gauge. It is also convenient to change the handle from one to the other, in case there are different sizes. Fig. 1 shows a straight plug 3 inches diameter, and Fig. 2 shows a taper plug and shell gauge, using the same handle. In making taper rods and taper holes the gauges

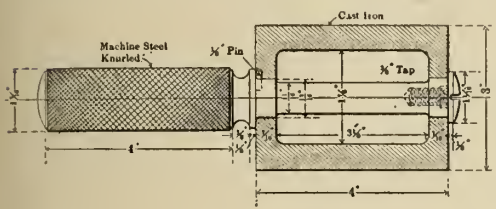

Fig. 1

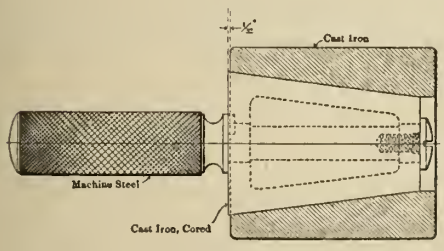

Fig. 2.

are used as follows: The plug is allowed to extend out of the hole 1-32 inch after reaming, and if the rod is fitted to within 1-32 inch of the shell, when they are tightened together, it will be about right to give them a good seat. Usually for brass I allow a little more than 1-32 inch.—I. N. Quire, in Machinery.

THE USE OF NAIL CORES.

THE use of nail cores in perforated cast iron strainers for the intake or suction end of pipes for pumps will be found a very simple and economical method of executing work of this character. While the manner of coring the holes is shown as applied to a strainer of cylindrical form as shown in Fig. 1, it can be applied to almost any form. It is particularly well adapted to flat work such as strainer plates, furnace door baffle plates, etc. The pattern is parted longitudinally and turned up as shown in Fig 2. It will be observed that the core print is turned with a shoulder (A), this being done to insure its proper setting into the mold. The mold

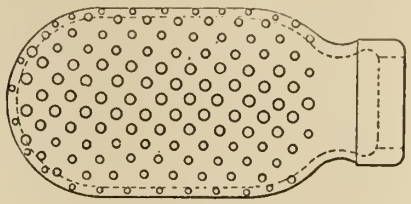

Fig. 1

having been rammed up in the ordinary manner and the pattern drawn, the nail cores, as shown in greater detail in Fig. 3, are set at proper intervals around the mold as shown in Fig. 4. The body core shown in Fig. 5 is then placed in position and supported by the nail cores. These cores are similar to those commonly used in coring babbitt anchorage in bearings.—H. J. McCaslin, in Foundry.

GAS TURBINES.

THE unsolved problem of the gas turbine, while calling forth a vast deal of theory, has hitherto been the occasion of very little practice. Some pertinent remarks made recently

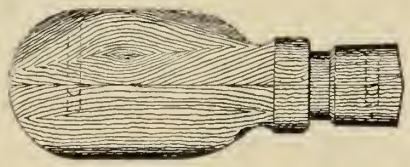

Fig. 2.

before the Societe des Ingenieurs Civils, by M. Sekutowicz are worth quoting in this relation. The author notes that M. de Laval, recognizing the suitability of his turbine for the purpose, proposed on perfecting it to construct a gas turbine on similar lines, but that hitherto no such turbine has come on the market. He also remarks, very justly, that although the difficulty of adapting a separate compressor should not be un-

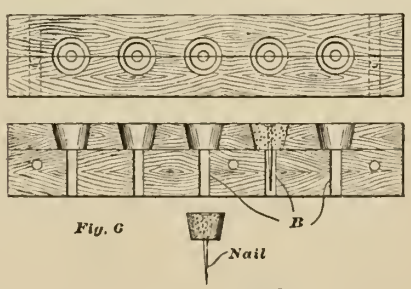

Fig. 6 Fig. 3

derestimated, it should not, on the other hand, be regarded as practically insurmountable. It is with this problem of separate compression that the matter rests at present. So far as can at present be judged, such an accessory is indispensable to a turbine of the de Laval type, and the work of reducing it to a practical form will have to be undertaken before a satisfactory or even, so to speak, a preliminary gas turbine can be produced.

M. Sekutowiez further remarks that apparently no sensational invention is to be looked for with regard to the gas turbine, i.e., no new application of the energy derived from the sudden expansion of the gas employed, which will enable a modified form of machine to be introduced without the accessories now deemed necessary.

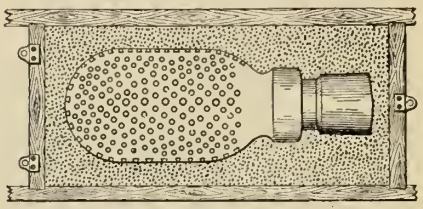

Fig. 4

The difficulty with the forms of gas turbine hitherto introduced has been the intermittent nature of the pressure, rendering the interposition of a piston in some part of the apparatus unavoidable. The theory on which the Diesel engine is based, i.e., the introduction of such a proportion of gas into a quantity of air that the combustion and consequent expansion is practically continuous, would seem to offer the most satisfactory indication of the direction for development. The accidental combination of brains (which are cheap) with money (which is dear) will ultimately result in the necessary experiments.—Le Journal de l'Electrolyse.

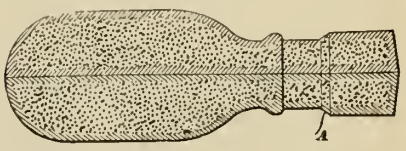

Fig. 5

MAKING THE BEST OF THINGS.

There is scarcely anyone who does not think but that he has been unjustly dealt with, in some respects, either by nature or fortune. What is to be done? If these individual imperfections can be remedied let us strive in every legitimate way to help ourselves. If not, why not make the best of them?

It is not so much our own actual condition of life that breeds happiness as the use which we make of our opportunities. Some people will be cheery and useful anywhere, and under any livable conditions. Others are correspondingly dismal. Therefore, as a matter of self-convenience at least, let us make the best of things.

Practical Questions and Answers

Automatic Engines.

Ques.—Why are certain engines called automatic engines? Wherein does the significance of the "automatic" lie?

Ans.—An automatic engine is one equipped with an automatic cut-off governing mechanism. The engine is governed by the automatic variation of the point of steam cut off. That is, should the load on the engine decrease, the governing mechanism cuts off the steam supply earlier in the stroke, thus decreasing the area of the indicator diagram, should a steam indicator be attached, which is an indication of a decreased amount of power transferred from the steam to the piston for that stroke; should the load increase, the cut-off is made to take place later in the stroke, giving an increased amount of power for that stroke.

Gasoline Vapor and Air Mixture.

Ques.—Suppose we have a mixture of gasoline vapor and air, the proportions of air to vapor varying from eleven parts air to one of vapor. Will any one of these mixtures completely burn if heated to the temperature attained by an exploded perfect mixture of gasoline vapor and air?

Ans.—To make the operations of a gas engine practical, ignition of every charge that is taken into the cylinder is necessary, consequently only mixtures most easily ignited can be considered. One to eleven is all right and comes within the range of easy ignition. But anything like one to 75 or 100 is entirely out of the question. And if such a mixture were completely consumed at the high temperatures referred to, what heat or power value could be expected from it? The gaseous vapor with about eleven parts of air might be consumed if the temperature were raised away above the ignition point of a perfect mixture, and the other 69 or 89 parts of air would simply be exhausted as heated air or gases, without having contributed anything whatever to the power value of the portion consumed.

Value of Reheating Steam in Compound Engines.

Ques.—Can you furnish data as to the exact value of reheating steam in its progress from the high pressure to the low pressure cylinder in a compound engine?

Ans.—The results of a test made by E. G. Miller, which were discussed in a paper by him before the Institution of Mechanical Engineers, in 1904, will probably answer this question. The engine tested was running at 65 r.p.m., and was operating on superheated steam at 155 pounds pressure per square inch, at a temperature of from 141 degrees to 450 degrees Fahr. During the tests the average indicated horsepower was 980, and the mean steam consumption obtained by measuring the water fed into the boiler was 11.3 lb. per i.h.p. hour. With the reheater in use the steam consumption was 0.51lb. less than when the heater was not used. The use and nonuse of the reheater considerably affected the relative outputs of the two cylinders. When the engine was working with steam in the reheater, the power in the high-pressure cylinder exceeded that in the low-pressure cylinder by about 17 h.p. On the subsequent test with the reheater out of use, the high-pressure cylinder developed about 103 h.p. more than the low-pressure cylinder, being about 44 h.p. increase on its previous load. Assuming that the point of high-pressure cut-off remained the same with the reheater in use as without the reheater, then under the latter condition, owing to condensation, a less quantity of steam would enter the low-pressure cylinder, and less power would be developed in the cylinder than with the reheater—that is to say, the reheater substantially increases the available power of the engine.

Why Dynamos Fail to Generate.

Ques.—What are the various causes why a dynamo will fail to generate current when operated; and what are the symptoms of each cause and the remedy?

Ans.—There are various reasons why a dynamo when operated will not generate a current or will not, within a reasonable time, build up the voltage for which the machine is designed. The chief reasons among these are as follows:

First, the risidual magnetism may be destroyed or may be too weak for the armature to generate a current. The symptom of this is the lack of attraction of the poles for a piece of iron placed in their vicinity. The remedy for this is to pass a magnetizing current from some outside source through the field coils.

The cause of the destruction of the risidual magnetism in the field of the machine are chiefly these: Vibration or jar, the proximity of another machine; and several other of minor importance.

Second, reversed connections or reversed direction of rotation. The symptom of this is that when the machine is running, the pole pieces do not attract a piece of iron. The remedy for this is to reverse either the armature connections or the field connections, but not both; or to move the brushes through 180 degrees for two-pole machine, 90 degrees for a four-pole machine; or reverse the direction of rotation.

Third, a short circuit in the machine or external circuit. The symptom of this is weakened magnetism in the poles which is usually to be detected by the lessened attraction of the poles for a piece of iron. If the short circuit is in the machine windings the only remedy is a careful inspection or test to locate the short circuit and then a proper fixing of it. If the short circuit is in the external circuit it will prevent the shunt-dynamo from building up its field magnetism until the external circuit is open, but with a series-wound motor the building up of the field magnetism will of course be hastened.

Fourth, field coils opposed to each other. In a case of this kind, if the pole pieces of a bi-polar machine are approached by a compass needle they both attract the same end of the needle; this shows them to be of the same polarity, whereas they should be of opposite polarity. In a multi-polar machine the same thing holds with each two consecutive poles. The remedy for this is to arrange the connections of the field coils so that when tested with a compass needle they will be alternately north and south.

Fifth, open circuit. If it is the external circuit which is open there is nothing to prevent the machine itself from working perfectly; but if the open circuit is in the machine itself the field magnetism will probably be very weak. The only remedy for this is to make a careful search for the open circuit, if it is external, and if in the machine, to test separately the field coil and armature with a cell of some kind for continuity of current.

Sixth, brushes not in their proper position. In a case of this kind the machine may not run at all, or if it does run, may generate only a fraction of its voltage and there will be sparking at the brushes. The proper position for the brushes depends upon the style of armature winding, and may be directly between poles or directly opposite the centres of the poles. Unless the style of winding is known this cannot be remedied in any other way than by trial. The brushes should be adjusted so that the machine will generate its normal voltage without abnormal sparking.

Foundry Practice

MODERN IDEAS FOR THE TRADE.

MULTIPLE MOLDS.*

By Jas. F. Webb, Elkhart, Ind.

THE first cost of rigging up for the multiple mold is not a great deal. You can use the same patterns that are used in a snap flask, the only change to be made is to put on two pins on the pattern board to the fit pin holes in the flask; and to put on an upright gate to connect the molds. It is good policy to have the upright gate ¼ inch shorter than the depth of the flask, and to cut through with the sprue cutter after drawing the pattern; if it is full length it interferes with the presser head. The next thing is to make a set of iron flasks. This is for molding machine practice. It is best to use iron flasks here as there is less chance for discount.

In railroad shops there is a wide range of work that can be made in the multiple mold. Fig. No. 5 shows some of our patterns rigged for multiple molds, all plain on top. In molding a 12x16 inch snap flask, 4 inch cope, 3 inch drag, there are 1344 cu. in. sand used to ram it up. In a 12x16 inch multiple mold 3 inches deep there are 576 cu. in. of sand, showing a saving of over 57 per cent. of sand to handle which is no small item in the course of a day, both in preparing it in the morning and handling it in the molds. Besides this there is the saving of floor spaee.

Twenty-four snap flasks 12x16 inches require a space of 32 sq. ft. to place them on the floor. Two multiple molds twelve high require a space of 4 sq. ft., allowing 4 in. between handles on the flask to operate them, which gives plenty of room for this purpose. This represents a saving of floor space of 87½ per cent. When business is good and room limited this is quite important.

Fig. No. 2 shows the comparative saving in floor spaee. Furthermore it illustrates how a great deal of hard work in pouring off is done away with. Snap flasks are commonly poured with a hand ladle of about 45 lbs. eapacity. Multiple

Fig. 1.—Multiple Moulds.

Fig. 3.—Multiple Moulds.

Fig. 2.—Multiple Moulds.

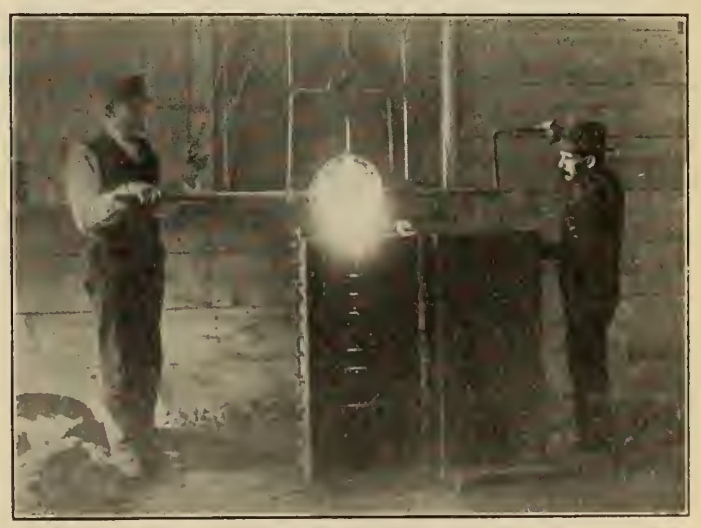

Fig. 4.—Multiple Moulds.

*Read at American Foundrymen's Convention Cleveland, Ohio.

molds may be poured with a larger ladle, say 200 lbs. capacity. An overhead trolley is a handy thing to have in pouring off.

Twenty-four snap molds that weigh 15 lbs. each mean 8 hand ladles for the molder to carry, and the same number in multiple molds means 2 ladles of 180 lbs. capacity to pour which makes it a great deal easier. (See Figs. No. 2 and 4) and the discount is not so great as in a snap flask, the loss being about 1 per cent.

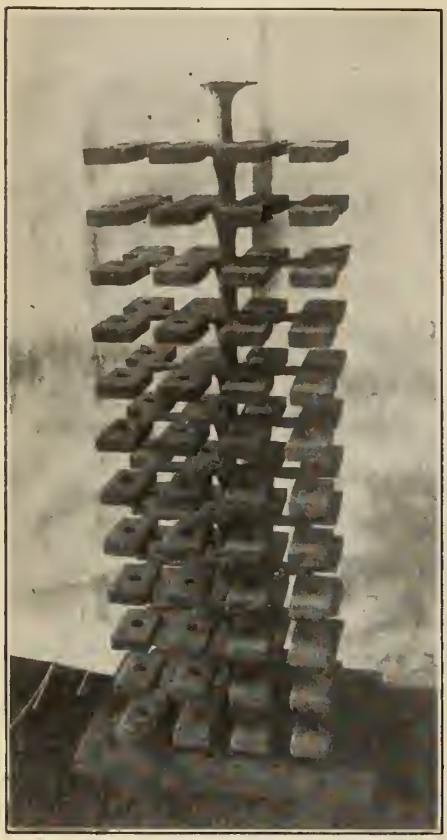

Fig. 5.—Multiple Moulds.

More patterns can be used in a flask, for they can come closer to the edge of the mold without danger of running out. See cut Fig. 5 as to quality of castings. We have patterns, where in a snap flask, twelve were as many as could be put in one mold, while in a multiple mold we now have eighteen, an increase of 50 per cent. output to each flask.

When making a multiple mold, the iron flasks must be arranged with a rib extending in about $\frac{1}{4}$ in. on the inside to hold the sand in the flask. When closing it down place the flask on the pattern board with the rib up, so that after it is rolled over it will be on the bottom. Have an iron frame to fit the top of the flask $\frac{3}{4}$ in. deep; riddle sand on your pattern and fill the flask flush with top of the iron frame. Put the presser head on and press your mold. Then take the frame off, strike off the sand even with the top of the flask, throw a little loose sand on top and rub down with a finish board, roll over, draw the pattern board and cut the gate, and place the mold on top as Fig. 2 shows. In making the bottom part of the mold use a regular bottom board and stop off the upright gate even with the other gate.

We are using the Farwell Molding machine to advantage in making multiple molds, and as it is not a high priced machine it will not cost much to try it out. One of them is shown in Fig. 1 with some of the patterns we are using in the multiple mold in connection with patterns we have on boards. We are using a brass frame on the outside of the board fastened at the corners.

The vibrator, which does away with all rapping by hand, we secured from E. H. Mumford & Co., who had just what we wanted and only cost $10.00. I don't know how we could get along without them, frame and vibrator attached being shown in cut Fig. 1 on the machine with knee valve fastened to lift the table at the right hand side.

In making these molds the gates leading to the casting want to be small enough to allow the iron to congeal and get set so as not to cause any undue strain or pressure. The metal in bottom mold gates want to set before the part above is filled. In making these molds it must be remembered that there are no bars in the flask, as they would interfere with shaking out. There should be enough sand under the pattern to keep it (the sand) from falling out. With a flask 3 in. deep we are making six castings in a flask 1 in. thick without any trouble. This allows 2 in. of sand under the pattern.

FOUNDRY COSTS

A DETAILED analysis of the costs of an iron foundry has been made at the Worcester Polytechnic Institute, Worcester, Mass., in connection with the course in mechanical engineering, and the important conclusion has been reached that the common practice of apportioning the burden cost per pound of castings produced leads the foundryman into two often unrealized errors, one that the cost of heavy castings is made too high, the other that the cost of light castings is made too low. The cost curves shown in the illustration, Fig. 1, one procured when apportioning burden per pound of product, the other procured when apportioning burden per molder's day, that is, on the basis of wages paid, show clearly the difference between the two methods of finding costs and the practical results of each.

Most iron foundries have a wide variety of work. Some of it is heavy, and the molder produces a large weight of castings a day. Some of it is light and intricate and the weight produced per day is correspondingly small. The usual practice in finding foundry costs is to lump all castings, large and small, into a grand total, and, dividing the total burden by the number of pounds produced in a year, or other given period, find the burden cost per pound. The Polytechnic investigation would indicate that much more exact costs can be procured by figuring in the burden on the basis of wages paid to molders. The total number of full days worked by all molders is secured by totaling the entire

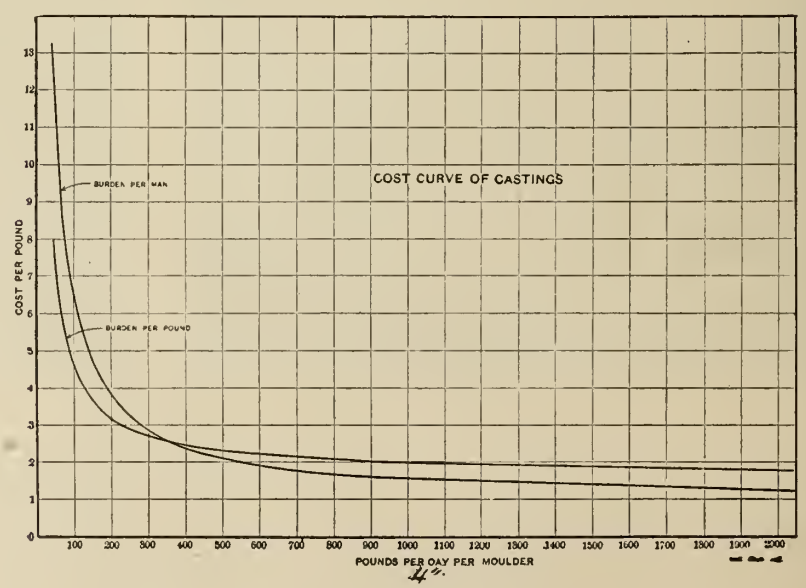

FIG. 1—Foundry Costs.

number of hours included in the molders' pay roll and dividing the total by the foundry day of so many hours. The result is the total number of days worked by all the men employed in molding. Dividing the total burden by the number of molders' days and the burden per day's pay is obtained; that is, the burden per molder's day.

The business of a foundry of moderate size was analyzed in its costs, the books of the company being available for the purpose. In the first place, as preliminary to plotting the cost curves, the costs were analyzed in great detail, with results as shown in the accompanying table, Fig. 2. In explanation of these figures it should be stated that the item of cost of iron includes every expense up to delivery on the foundry premises; the cost of melting everything to the delivery of the metal to the molders; and cleaning everything from the rough casting to the finished product, ready for shipment.

For the sake of convenience the wage per molder's day was arbitrarily fixed at $3, and the cost of iron at 1 cent a pound, melted, which thus includes both the items of cost of the iron itself and its melting. Consequently costs are reduced to three elements: Burden, molders' wages and melted iron. It makes no difference in using the burden item of the table that the cost of iron and wages are arbitrarily fixed. Percentages do not enter into the calculation, and correction must be made in any case from these two items if the curve were to be adapted for use with the cost of labor and iron in varying figures. The formula employed provides for variations in cost of labor and melted iron.

Having ascertained the burden per pound of castings produced and the burden per molder's day, as already explained, equations were formulated from which the curves were plotted. Let W represent weight of castings produced by a molder per day; C the cost per pound of iron melted; M the wage per day of the molder, and B the burden per day of a molder, and the following equation will permit the curve to be plotted from the books of any foundry, basing burden on molders' wages and not on volume of product in pounds:

$$p = \frac{(W \times C) + M + B}{W}$$

In securing the curve here shown, C is made to equal 1 cent and M $3. Substituting different weights as representing a day's work of a molder and the curve is obtained.

To secure the curve based on burden per pound of product, W represents weight of castings; C the cost per pound of the iron; M the cost per day of molder, and B the burden per pound of iron. The equation follows:

$$p' = \frac{(W \times C) + (W \times B') + M}{W}$$

The very marked difference between results obtained by figuring costs by the two methods is obvious from an inspection of the curve. As no objection is offered in the various systems of reckoning costs of manufacturing to apportioning burden on the basis of wages (in fact, it is the commonly accepted method) it is fair to presume that the curve of "burden per man" is a correct one. On the other hand, it is an universally accepted truth that where two products of the same manufacturing establishment vary in character it is not an accurate method to lump the two and strike an average based on any one factor. In such instances the best method, and consequently the most accurate, is to separate the departments in determining the apportionment of burden. This is true of the problem worked out in the two curves. It will be noticed that the two methods agree at only one weight of castings produced by a molder in a day, at 360 pounds. When the weight is greater than that figure the "burden per pound" curve runs high; at smaller weights, which means more costly castings per pound, the "burden per pound" curve runs low. For example, in figuring on some heavy work, which the molder can do at the rate of 1,500 pounds per day, it means a good deal whether the foundry figures on a cost of 1.4 cents or 1.9 cents. Half a cent a pound means a good deal in landing a contract. On the other hand, in figuring small work, or work so intricate that the molder can produce but a small weight of castings per day, the foundryman may lose money if he figures on the "per pound" basis. At 200 pounds the difference in cost between this method and the "burden per man" method is as 3.2 cents and 3.8 cents; at 100 lbs. as 4.5 and 6.6 cents; and at 50 lbs. as 7.5 and 11.4 cents. Such, at any rate, is a natural conclusion if the accuracy of the "burden per man" method is accepted, and, as already stated, cost systems usually take wages as the basis and not volume of product.

Doubtless many foundries which reckon costs on the burden per pound basis are making money, but it is argued that their profits are obtained from their heavy work, while light castings are bearing little part of the shop burden. The low prices at which many machine shops are getting their light castings is due to the fact that foundries are not working on the per molder day basis.

Suction Gas: Its Production and Application

A Series of Articles on Producer Gas, Its Production and Application as Shown by German, French, English, and American Practice.

By Emil Stern *

ARTICLE I.

IN view of the great interest which has been evoked in Canada in producer gas, it is in keeping that a series of articles of this kind should be written for Canadian Machinery at this time. This article deals in an historical way with producer gas. Later will follow articles dealing with the general gas-making process and the heat efficiency of producer gas, the principal constructions adopted by different manufacturers, showing their advantages and disadvantages, hints regarding the practical working of the producers, and comparison of gas with other forms of power as to installation, fuel consumption, attendance, depreciation and interest. Then, should the interest in the series warrant it, producer gas engines will be considered.

Shortly after the invention of the four cycle gas engine by Mr. Otto, Deutz, Germany, in 1876, it was seen that the gas engine could not compete against steam engines in large units. So very soon the idea arose to get a cheaper gas and to make oneself independent of the city gas mains, so as to be able to use to advantage the gas engine outside of large cities.

The first idea was to make oneself independent of the city mains by building a small gas works near the engine to make a low grade lighting gas, but this is really not practicable for the same reason that it is not advisable to have such a gas works in a residence. Gas of this kind would have to be made in retorts and with a plant of moderate size, and the rate of producing the gas would be far slower than the rate of consumption. It would, in fact, be necessary to make gas continuously night and day, and to store it in a gasholder of considerable capacity, to provide gas enough for the comparatively short period during which it would be consumed. Apart from this it would be necessary to keep the retorts and their brick setting at a high temperature, for if they were allowed to cool it would take a long time to get up the required heat again. The first invention providing a cheaper gas for running gas engines was the Dowson pressure gas producer only two years after the gas engine was invented.

In 1878 Mr. Emerson Dowson designed and constructed a gas-making plant of which Fig. 1 is a diagram. (B) is the gas producer containing small anthracite ($\frac{3}{8}$ in. to $\frac{3}{4}$ in. cube) or small gas coke. The gas is made by forcing through the fire in (B) a mixture of superheated steam and air, the steam being supplied from a little vertical boiler (A). The steam which passes through the fire is decomposed, owing to its oxygen having a greater affinity for incandescent carbon than for hydrogen. The oxygen of the air also combines with some of the carbon. The resulting gas consists of about 18 to 20 per cent. hydrogen, 1 to 2 per cent. marsh gas, 4 to 5 per cent. carbon dioxide, 22 to 25 per cent. carbon monoxide, and about 50 per cent. nitrogen. The process is continuous, so long as it is required, and on the gas leaving the generator (B) it passes through a water seal in the hydraulic box (C). This not only helps to cool and clean the gas, but the seal prevents gas from other parts of the apparatus being fired accidentally by the incandescent fuel in (B). From (C) the gas passes through a column of coke in (D), which is kept cool and moist by a spray of water. From (D) the gas passes through sawdust in (E), and then into a small gas holder (F). From the latter it is conveyed in a pipe to the engine, while some of the gas can also be used for heating purposes if required. The benefit of the gasholder is that it maintains a constant pressure of gas in all parts of the plant, it also prevents air getting into the plant, and it gives sufficient storage capacity to cover little fluctuations in the rate of production. A useful addition is the arrangement (G) for governing automatically the rate of producing gas to suit a varying rate of consumption at the engine. A jet of steam at the pressure from the boiler (A) is used to inject into (B) the air required for carrying on the combustion

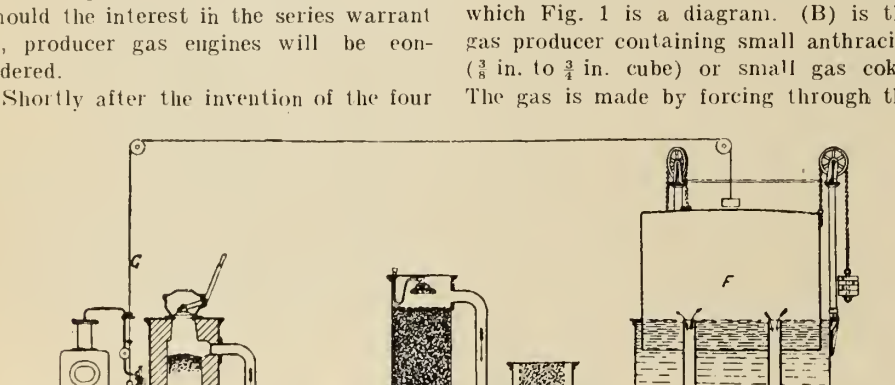

FIG. 1—The Dowson Gas Plant.

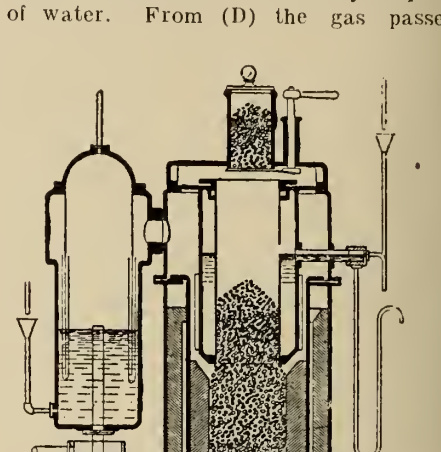

FIG. 2—The Bernier Plant.

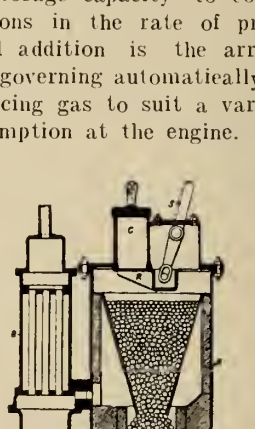

FIG. 3 The Taylor Producer.

* Consulting Engineer of the Economic Power, Light and Heat Supply Co.

of the fuel, and the rate at which gas is made depends chiefly on the quantity of steam and air sent into (B). By the arrangement (G) the rise and fall of the gasholder (F) raises or lowers a weighted lever which acts on the valve which admits steam to the injector on (B). It will be easy to realize from this that when the gasholder is low, and when the maximum production is required, the steam valve can be made to open fully, to admit the full supply of steam required. When, however, the gasholder is nearly full, and when less gas should be made, the steam valve is wholly or partly closed. In this way the rate of producing gas is regulated automatically to suit the varying load, and consequently the varying consumption of the engine.

The Dowson pressure plant, although being a success, was too complicated and took too much space and attendance to become popular. The separate steam boiler involves the consumption of about 25 per cent. more fuel than is actuall used in gas making within the generator. Nevertheless the importance of Mr. Dowson's discovery cannot be over-estimated when one considers first how rapidly the gas engine has developed in size and popularity in consequence of the resulting cheap supply of power gas; and second, how it has been possible by the experience gained from the larger engines thus called into existence to go on increasing the unit power per cylinder year by year until we may now see single and multi-cylinder gas engines in successful operation in sizes that seemed quite impossible then. These largest engines are operated with blast furnace gas but the gradual evolution from 20 h.p. to 2,000 h.p. unit has been made possible by the experience gained with those of intermediate power.

After Dowson's invention in 1878 the development of gas producers stopped for 17 years and no valuable improvements were made. Now his fellow engineers have used the position gained by his invention and have shown how a simpler apparatus can give practically similar service. The field has again been extended thereby, and now almost every power user, if he will, may take advantage of the most economical form of power yet devised and in doing so can save in working expenses a sum that, a few years ago, seemed quite impossible and incredible. And this with less risk of fatalities, fires or breakdowns.

In 1895 M. Bernier, of Paris, invented a gas-making plant working upon the Dowson principle of a simultaneous blast of steam and air through incandescent fuel, but designed to utilize the waste heat of the generated gas in making steam. This plant is shown in Fig. 2. It was M. Bernier's ambition to make all the steam from the sensible heat of the gas, as in the proper operation of engines gas has to be cooled in any case and until his experiments, all the sensible heat had been wasted. M. Bernier was successful in raising some steam at atmospheric pressure, but it was then evident that some apparatus had to be devised to force or draw the steam and air through the fire. He decided to provide an auxiliary piston by the side of the working cylinder of a gas engine, and arrange this to suck the gas from the plant and deliver it to the engine. He evidently did not consider whether or not the engine could draw its own ga or probably he thought to obtain all the power he could from a well filled cylinder even at the expense of loss in mechanical efficiency. M. Bernier's plant, while encouraging, was not very successful, although considerable improvements were made later on. M. Taylor & Co., of Paris, still further developed the producer, a view of which is shown in Fig. 3, and in their hands it became a commercial success both in France and in England. A few examples are still to be seen at work in the latter country.

In 1895 Messrs. Koerting Bros., of Koertingdorf, Germany, were also experimenting in the regenerative principles and as a result instructed their agent, C. Wiegand, of Hanover, in July, 1895, to take out patent rights for a producer which made gas only when air and steam were drawn through the fuel under the influence of a negative pressure caused by the piston of a gas engine during charging strokes. The results obtained from these experiments were discouraging and the patent abandoned. According to Mr. John Koerting, irregular working of the engine under light loads due to fluctuating low pressures through the plant, was experienced and it was felt that the pressure type was the more effective. In the light of the experience since gained it is not difficult to imagine the poor results achieved. The separate steam boiler was still an essential feature as was also a gasholder which, however, provided with balance weights and rollers, would give very unsatisfactory variations of pressures due to friction of moving parts and the inertia effects of the bulky "bell."

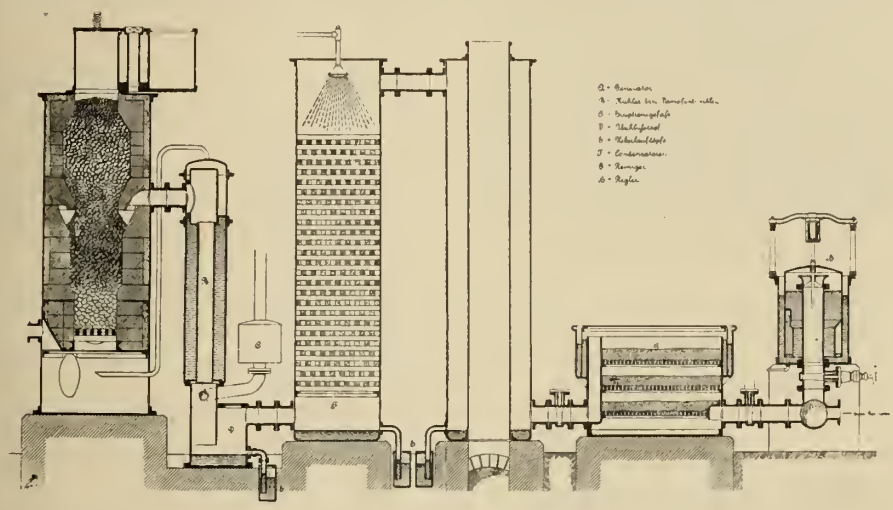

FIG 4—The Earliest Pintsch Producer.

In 1901 the firm of Julius Pintsch, of Berlin, made and erected a suction plant of their own design for T. Geotz & Conrad, to serve a gas engine driving an electric light and power plant at Heusy, a suburb of Verviers in Belgium. The T. Geotz Co., when accepting the order for the engine, were very doubtful about the proper working of the engine with the producer and made it quite clear from the first that, in their opinion, successful operation would only be obtained by the addition of a separate boiler and gas holder. After erection ten days were spent in trying to start the engine, and it looked as if the gas engine firm's distrust was justified. Mr. H. Gerdes, chief engineer to Messrs. Pintsch, was then sent for and after properly adjusting all details and superintending the proper blowing up of the fuel, he had the satisfaction of seeing the engine started off splendidly and the installation has ever since been in successful operation.

Fig. 4 shows a complete diagram of the Pintsch producer. (A) is the producer; (B) is the steam boiler, the steam being generated by the hot gases passing through it; (C) is a safety box which is left out on modern plants as unnecessary; (D) is a syphon; (E) are overflows; (F) is a wet scrubber filled with wooden grids; (F) is a special water separator; (G) is a sawdust purifier; and (H) is the governor. This plant is not much different from the type now manufactured by the same firm.

The advantages of the new system of generating power were so striking as to excite the whole world to competition, and really since that day, hundreds of manufacturers have been offering suction gas plants of any size and for any price.

Machinery Development

Metal Working **Special Apparatus** **Wood Working**

A NEW INSIDE MOLDER.

THE accompanying illustration is of a new molding machine which is now being placed on the market by the S. A. Woods Machine Co., Boston, Mass. The machine embraces a number of new features, which features the builders say have been thoroughly tested and proven good. These improvements qualify the machine to perform all the duties that modern practice would require of a molding machine, and it also may be used as a planer and matcher. One of the chief improvements in the new molder is the providing of special hold-down features and bar adjustment in order that the machine may be adapted to working flooring in an efficient manner. The features which make the machine adaptable as a planer and matcher are . vertical adjustment of the side spindles from above the frame while the machine is running ; edge guides and hold-downs, after cut, attached to matcher plates similar to planers and matchers; parallel adjustment of top pressure arms, also independent adjustment of either end and pressure-shoes; bar, after top cut, travels vertically with the top cutterhead; bar before bottom head adjustable on a horizontal plane from the outside by means of a crank; quick adjustment of all bars for more or less opening, as desired.

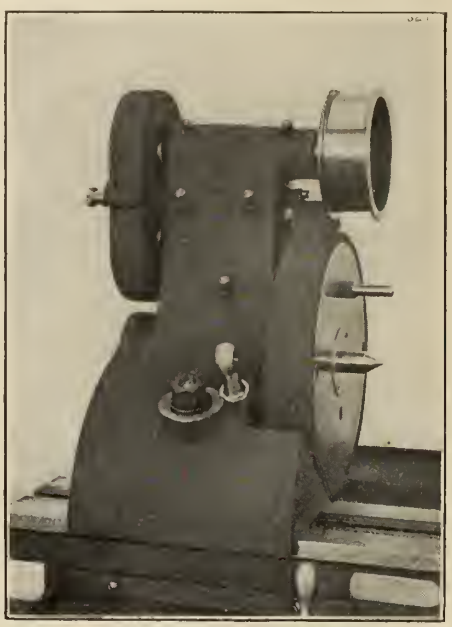

FIG. 1—New Style of Head Stock.

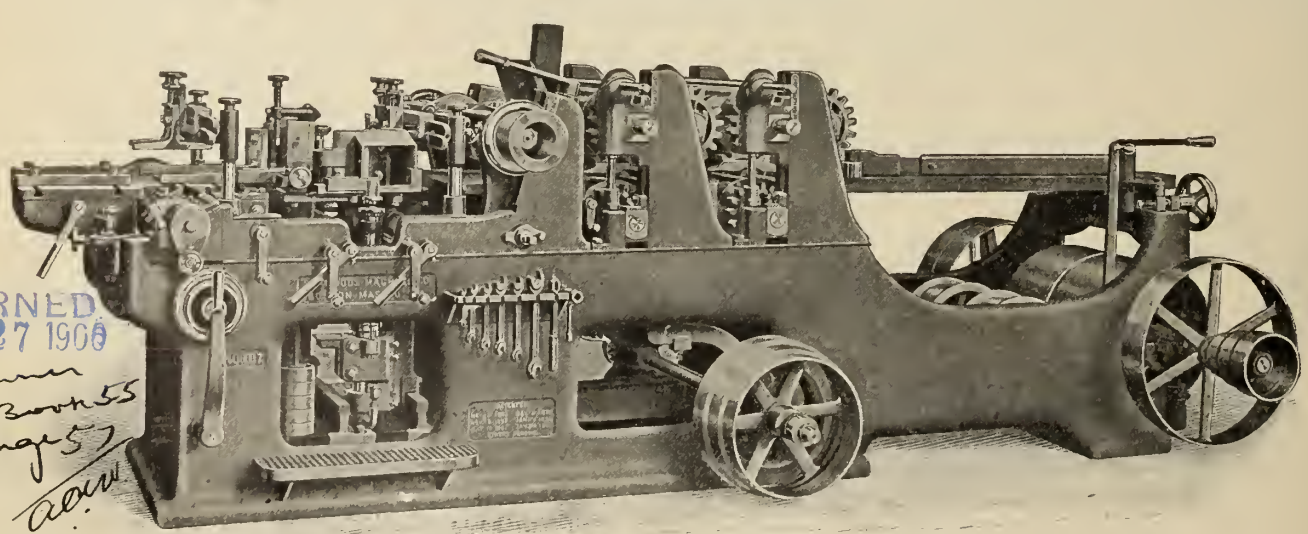
guides—provision also made for vertical adjustment; end table has independent horizontal movement and can be drawn out for access to cutters; patent adjustable knife-setting gauges; parallel plate under top head for projecting cutters; top chipbreaker fitted with sectional shoes, each independently adjustable, vertically, horizontally or on an angle; extra swivel to matcher works; swinging pressure-arm with screw adjustment for side heads. This new molder is built to work 12 or 15 inches wide by 6 inches thick, and with four or five heads.

NEW STYLE OF HEADSTOCK.

THE accompanying illustrations are of a new style of headstock now being used by the Landis Tool Co., Waynesboro, Pa., on their grinders. In the headstock formerly used the spindle was driven direct from the countershafting by belt, and it was found that sufficient power could not be obtained in this way to allow for the style of cuts that were warranted by the grinders. Then, too, an adequate range of speeds could not be obtained. To overcome these difficulties a geared headstock has been designed, the spindle being driven indirectly through gearing from the countershaft. In the arrangement the driving pulley can be run at a high rate of speed, and in the reduction of speed to the spindle a greatly increased torque on the spindle can be obtained.

This head contains five mechanical



A New Inside Moulder

RETURNED
SEP 27 1906

Other special features of the molder are : patent side wing, self-oiling, self-adjusting clamp boxes; belt-releasing device for matchers (patent pending); hoist for bottom head from working side, also independent adjustment of either end from same point; patent pin-setting guide; renewable and adjustable changes of speed, which are obtained by shifting a notch bar. The notches which engage the clutch pins are so spaced relative to the distance between

centres of the clutch pins that only one clutch pin can be engaged with its respective gear wheel at any one time.

Fig. 1 gives a view of the headstock, while Fig. 2 shows the class of work

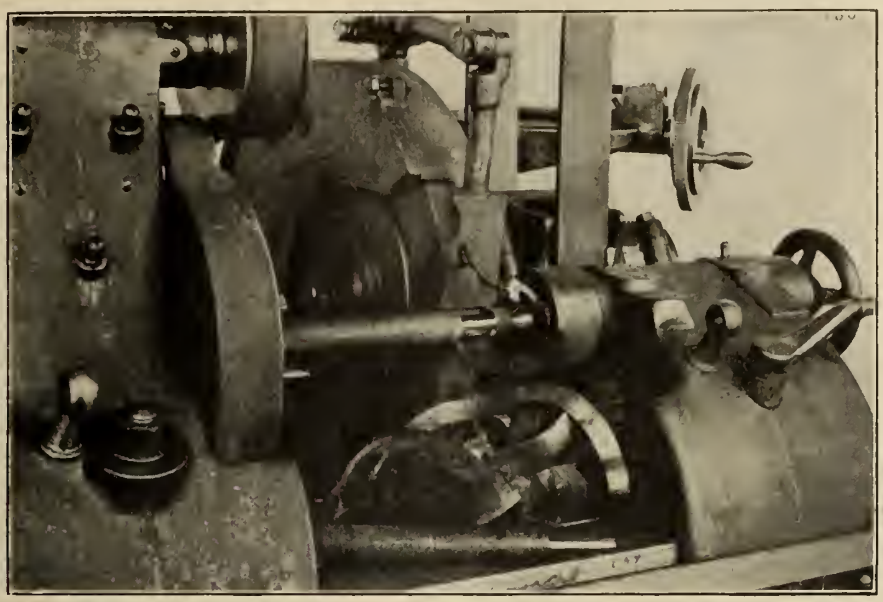


FIG. 2—New Style of Head Stock.

which can be accomplished with the Landis grinder when equipped with this headstock.

Corundum is used in the manufacture of their wheels, and some special wheels have been designed for heavy cutting, such as shown in Fig. 2.

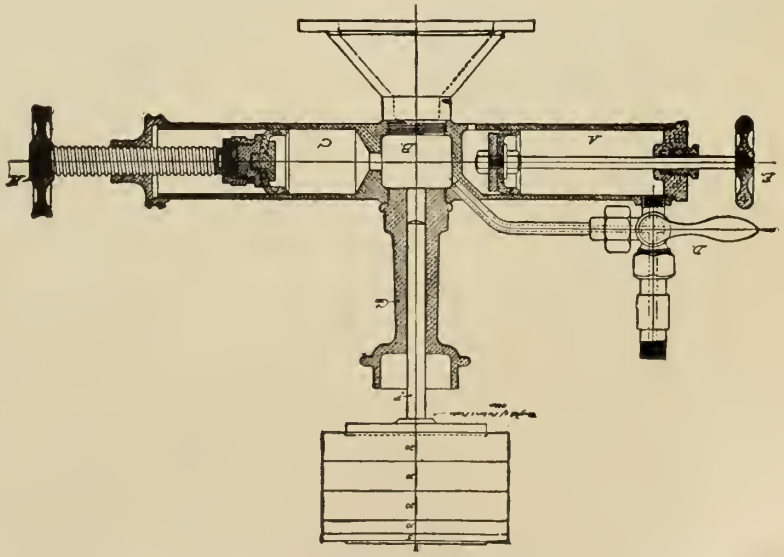
A NEW STYLE OF GAUGE TESTER.

AN improved dead weight gauge tester has recently been placed on the market by the American Steam Gauge & Valve Mfg. Co., Boston, Mass., which is shown in the two accompanying illustrations. The makers claim that it possesses all the advantages of the mercury column, enclosed in a much smaller space, and that it is perfectly accurate. The accompanying illustration is a sectional view of the gauge, and the following description of its construction and operation will be of interest :

The principal parts of the pump are a chamber, (B), connected directly with the gauge to be tested, and the cylinder (G), containing the piston (F), upon which the weights act, the cylinder (C) having a screw plunger for raising the piston (F) under weight and the auxiliary oil chamber (A) having a plunger for filling the connection between the gauge and the main chamber (G) through the three-way cock (D). The weights and the area of the piston (F) are proportioned to produce directly on the gauge to be tested the pressures indicated on the weights. The weight of the piston and the attached plate alone produces a pressure of 5 pounds, and additional weights, in sizes corresponding to pressures of 5, 10 and 20 pounds, are placed upon it to the required amount. By various combinations of the weights any pressure that is a multiple of 5 pounds may be obtained. The oil is contained within the pump at all times, eliminating the necessity of pouring it in and out before and after testing.

To place the tester in commission the chambers (A, B and C) are filled with a light mineral oil, chamber (A) being filled through the cock (D) when the handle is turned down and the plunger handle (E) is pushed clear in, and chambers (B and C) being filled through the cylinder (G) after removing the piston plate. A gauge to be tested is attached above the cock (D) by suitable connections furnished with the gauge tester. The handle of the cock being down—that is, at right angles to the supply pump (A)—the handle (E) is then pulled out until the gauge shows pressure and the tube is filled. Then by turning the handle of the cock (D) into the position shown in Fig. 2 the gauge is connected with the chamber (B). The weights are next added on the piston (F) until the desired pressure is reached. At all times during testing, the plate on the piston (F) should be kept about 2 in. above the cylinder (G) by screwing the hand wheel (H) in or out, which, of course, has no effect on the pressure, but it is not necessary to continually manipulate this plunger. It is usually sufficient to raise the table and plunger twice while testing to 500 pounds.

Before disconnecting the gauge the handle of the cock (D) is turned down and the handle (E) is pushed in. All oil is then drawn off or drained from the gauge tube into the chamber (A), preventing spilling of oil when the gauge is disconnected. The necessary wrenches, hand set, hand jack, four connection nipples and pliers accompany the instrument for connecting the gauge and adjusting it.

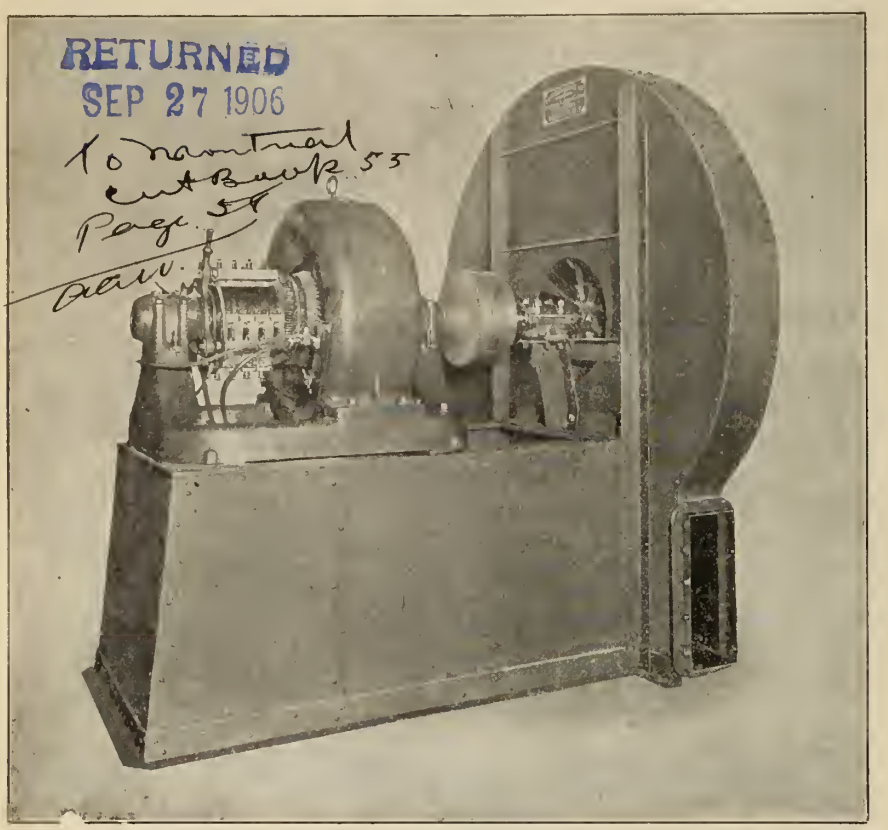


New Style of Gauge Tester.

A BLAST FAN OF UNUSUAL PROPORTIONS.

RECENTLY the Chicago, Burlington & Quincy Railway Co. were furnished with a blast fan of rather unusual proportions, designed of course to operate under special conditions. The fan was designed to furnish 7,200 cubic feet of air per minute at a pressure of ten ounces per square inch. The unusual proportions of the fan were required in order that it might be run at 830 revolutions per minute, the standard

speed of the Crocker-Wheeler motors, one of which was to operate the fan.



RETURNED
SEP 27 1906

A Blast Fan of Unusual Proportions.

The blower is equipped with three-quarter housing, as shown in the illustration, and is provided with a blast wheel 73½ inches in diameter, and 3 inches wide at the periphery. A complete test made on the fan showed that when delivering 7,200 cubic feet of air per minute the fan was capable of maintaining a static pressure of 11.8 ounces, a good margin above the specification.

This fan was built by the Buffalo Forge Company, and in Canada the Canadian Buffalo Forge Co. are in a position to build special fans of like kind.

A NEW RADIAL DRILL AND TAPPING MACHINE.

IN the accompanying illustration is shown a new radial drill and tapping machine being placed on the market by the Newton Machine Tool Works, Philadelphia. The features of importance in this machine might be summarized as follows: The spindles are 2 13-16 in. in diameter, and the drilling spindle, which has an automatic feed of 17 inches, is driven by spiral gears, the driving shaft being back-geared through gears on the radial arm. the tapping spindle is geared from the drilling spindle with a speed reduction of 2¼ to 1; the hole having been drilled by the drilling spindle, one turn of the hand wheel will bring the tapping spindle in line with the drilled hole, after which all that is required in tapping is to draw the tapping spindle down and drop in the clutch, and since the speed reducing device is contained in the head the correct tapping speed is obtained for whatever sized drill may be used; the tap is reversed and drawn by a quick power movement; the tool is motor driven, as shown in the illustration, by a 7½ h.p. variable speed motor, with which the necessary speed variations are obtained; the arm is 6 ft. 6 in. in length, and is fitted with conical roller thrust bearings, and is provided with quick power movement; the maximum distance from the end of the base is 38in. wide and 9 ft. long.

Experience is a good thing—almost an absolute requisite to our attainment of success! Yet how often do we see men who have had the experience of a lifetime and who never made a success of anything? Experience is an excellent burnishing on top of good, sound judgment. The two go well together; the one is dependent upon the other. There may be cases where experience counts for most, but they are few, if indeed there are any. The man who lacks experience can gain it, but the man who lacks judgment can not. — The Woodworker.

New Radial Drill and Tapping Machine.

The Canadian National Exhibition

The Pressing Need of a New Machinery Hall at the Exhibition

THE Canadian National Exhibition is a great exhibition. Everybody says so; and everybody knows. But there is nothing so great that it might not be greater; there is no enterprise so successful that it might not be more successful; and there is no exhibition so educative to the general public that it might not be more so. Thus it is with the Canadian National Exhibition at Toronto; it is a great exhibition; it is a successful enterprise; and it is educative to the general public. But there is one feature of the Exhibition which must be given more attention than it has previously received, and this is iron-working, wood-working and power machinery. To the general public, knowing practically nothing of machinery, the Machinery Hall, as it at present exists, is of passing interest, because there they see the wheels go round; but that class of interest is of little or no use to the exhibitors. To the mechanical man, however, there is nothing of sufficient interest, outside of the few exhibits, to hold his attention for any length of time. To him the hall is educative in a very small sense of the word. Why is this? Is it the exhibitor's fault; and is it because manufacturers of these lines cannot make exhibits of interest to mechanical men? Far from it. The reason is simply this: that there are not the facilities for making the exhibits, or, in other words, the reason is the woeful inadequacy of the Machinery Hall as a Machinery Hall.

Each year some improvement has been made in the way of new buildings; but each year the Machinery Hall has been neglected. A splendid Manufacturers' Building has been erected; there has been a new Dairy Building put up; lovers of art have been favored with a new Art Building; a natural history exhibit has been added; a new Process building has been erected, which is indeed a credit to the Exhibition; and now the contracts for a new Horticultural Building are about to be let. And all this time the Machinery Hall has stood on the hill, a monument to the neglected feature of the Exhibition. The progress of Canada along machinery lines is a living protest against the scant attention which has been paid to machinery at the Exhibition. Canada is a country of natural resources, and the chief agent in the development of these resources is machinery, and yet machinery at the Exhibition is forced to take a back seat. Think of the mineral resources of Canada, and look for at the fair the means of development of the resources, and it will not be found; think of the product of the forest, and at the Exhibition look for machinery used in the manufacture of this product into commercial commodities, and one will find but a very small showing, consisting of one exhibit of saw mill machinery, cramped into too small a space, and in addition one or two machines used in planing mills. Then think of machine tools, first essential of all iron working industries of any kind, and one will find that not a single manufacturer is exhibiting, and that the number of tools exhibited by machinery dealers is very limited, because of lack of space. Power machinery is better represented than any other class, but even here the exhibits, taken as a whole, are not representative, there being lacking adequate representation of one of the most important of prime movers, the steam engine.

Whether a new Machinery Hall should, or should not, have been built before some of the new buildings which have already been erected, or are being now considered, is a debatable question, but that now is a dead issue and need not be touched upon. At present practically all who would pretend to discuss the question are firm in the belief that a new hall is needed, and needed badly. And a new hall will be built, but the question now will be one of the time of building, and the cost. Now that those interested have waited so long it is in keeping that they should advocate strongly the erection of a building which will be a Machinery Hall in the true sense of the word. The first consideration will be that of the site, in the vicinity of the railways, so that sidings from both the C.P.R. and G.T.R. can be obtained. The second consideration will be that of size and plan. The size must be such as to include all the machinery exhibits now on the grounds, and also those of firms who would exhibit if space and machinery handling facilities were available. This year some of the most interesting machinery exhibits were to be found outside of the Machinery Hall, some in the Process Building and some in tents. This certainly should not be. The size of the building should also be such as to provide adequate space for each exhibitor, so that he will not be handicapped in making a suitable display of his goods, as nearly all the machinery exhibitors are at the present time. Then, too, there should be space for purely educative exhibits, the expense of which the Exhibition itself might have to stand. The shape of the building should be such as to provide for extensions, and at the same time not occupy too much space relative to the floor space of the building, and the shape should also be such as to provide for the proper handling of the machinery, and also for the classification of exhibits. The third consideration will be that of handling the machinery, and in this respect a siding into the building, electric traveling cranes and jib cranes are essential features. Heavy machinery cannot be handled to advantage without these modern conveniences. Only this year two firms were prevented from adding to their exhibits some very interesting but heavy machines by the lack of these facilities. The manner at present adopted of handling the machinery at the hall is certainly unsuited to the requirements.

The whole issue may be summed up in the statement that a new modern Machinery Hall is needed at the Exhibition, and this hall should be made of such decided interest to mechanical men that it will be a good investment for manufacturers and dealers in all lines of machinery and machinery supplies to not only occupy space but to go to sufficient expense to make their exhibit of decided educative value. The first phase of this question which will have to be considered by the Exhibition aulay. And in considering expense, and they must not expect to obtain a suitable building without considerable outlay. And in considering expense, aod returns for that expense, the question should be looked at from all points of view, and if this is done this conclusion will probably be reached, namely, that a liberal policy is the best policy.

As conclusive evidence of the widespread interest which this question of a new Machinery Hall has evoked among manufacturers, and others, the following opinions are printed, which were obtained by Canadian Machinery through letters sent out or in interviews:

H. W. Petrie.—Is very desirous of seeing a new and up-to-date Machinery Hall erected. He thinks that more space is required and better equipment for the handling of machinery, and that the location of the present building is out of the way, and that it is very improperly ventilated.

Canada Foundry Co.—Mr. H. O. Edwards has taken very considerable interest in the erection of the new Machinery Hall at the Exhibition, and in connection with Mr. H. G. Nichols, who is chairman of the Machinery Hall committee, has originated plans and speci-

fications for a hall, and have made estimates as to its cost. The style of building which they would suggest consists of four wings radiating from a centre, thus forming a cross. These wings would be 200 feet long by 80 feet wide. If at present all four wings were not required, three might be built and space left for the fourth. The location of this building would be arranged so that the main entrance to the southern wing would be directly opposite the northern entrance to the Process Building. Passing the entrance of the northern wing would be a railway siding. The building would be equipped with an electric crane running the entire length of the northern and southern wings, arranged so that it could pick up machinery from cars on the siding and convey it into the building. The eastern and western wings would be served by hand cranes, and where they were required jib cranes might be installed. The exhibits should be classified, and a department in the building set aside for each class. If a new building were erected the Canada Foundry Co., and the Canadian General Electric Co., would make a much larger and more elaborate exhibit even than they do at present.

The Canadian Fairbanks Co. — Mr. Brittain strongly advocates the building of a new Machinery Hall at the Exhibition equipped with the proper facilities for handling machinery, this equipment including electric cranes and jib cranes. He thinks that the machinery exhibits should be classified, and as a point in favor of this spoke of the unsystematic way in which gas and gasoline engines were exhibited at the Exhibition this year. He thinks that there should be a section devoted to gas and gasoline engines in the new hall. The Machinery Hall, he thinks, should have been given equal consideration with the new Process Building, and as a feature of the Exhibition it would have been at least equal in value.

The A. R. Williams Machinery Co.—A modern Machinery Hall should be built having all the necessary appliances for the adequate handling of machinery. The shafting, if possible, should be run under the floor so that the machines could be belted up from below, thus doing away with dangerous counter shafting and belting in the exhibit. If the new Machinery Hall were built it would be one of the most attractive features at the Exhibition, and in that case we would be in a position to use at least double the space we have at present. We would suggest that the Exhibition authorities induce the railway companies and locomotive works to exhibit locomotives.

The Consolidated Electric Co.—There is certainly a very great need of a new Machinery Hall at the Exhibition, with modern equipment and greatly increased space, having a more prominent position on the grounds. The Machinery Hall is of great importance to the Exhibition, and should be given consideration accordingly. If a new hall were built we would be in a position to take at least double the space which we have at present, and would in that case make a much more elaborate display; indeed we would build machines especially for the Exhibition.

The Economic Power, Light & Heat Supply Co.—We would like to obtain space in a new Machinery Hall.

London Machine Tool Co.—A new Machinery Hall is needed very badly, and if one were built we should be glad to use space.

Goold, Shapley & Muir Co.—In reference to placing machinery in a modern building at the Industrial Exhibition, we quite agree with your idea that a great improvement could be made by grading all the different lines to exhibit, and place them in as close proximity as possible. No doubt thousands of visitors come to inspect a certain line of machines that they are interested in, and to make fair comparisons it is impossible for them to do so intelligently if they have to run from one building to the other, the same as they have had to in our line of exhibit, viz., gas and gasoline engines. We trust that the stand you are taking in this matter will have influence from the industrial board and bring about this much needed reform.

The Dodge Manufacturing Co. — You have asked us our opinion as to the requirements of a new Machinery Hall at Industrial Exhibition grounds. In this connection we would say that we have been of the opinion for some time that the Machinery Hall was entirely inadequate. If we are to expect the machinery builders of this country to exhibit we must provide ample facilities, and this means in the first place a building so situated and designed as to permit of a railway siding running completely through it; next it must be of ample proportions, and so constructed and designed as to accommodate adequate over-head traveling crane facilities. It should be possible for such people as the John Bertram Co., Dundas, to ship a large machine tool into the building on a flat car, and the over-head crane facilities should be there to lift this tool off and lay it down in place at the company's exhibit. This also means that the floor of such a building should be of such a character as would permit of sustaining heavy loads. Such a building for the requirements might easily be six to eight hundred feet long by at least two hundred feet wide, steel construction, and would no doubt cost considerable money; but until we have something such as here described we will hardly be able to say that we have a modern Machinery Hall, nor need we expect machinery builders to exhibit.

The Smart-Turner Machine Co. — We think the time has come when the Canadian National Exhibition would be materially benefited by a suitable Machinery Hall, which would be properly equipped for exhibiting heavy machinery, and so arranged that piping could be laid under the floor so as to enable gasoline engines in the centre aisle to be operated without undue expense to the exhibitor.

J. N. Tallman & Sons.—We are very much in favor of having the National Exhibition Association put up a new Machinery Hall. The writer has been going down there for some years, and might say that after being there in the building for two weeks, a person is ready for a couple of weeks holiday to recuperate. The present building does not seem to be ventilated enough and consequently the place is hot and stuffy. We think it would be a good plan to have a new building so that the regular exhibitors could get a permanent spot and fix it up, so that they could use it from year to year. As it is now the majority of us have to shift around each year, and it does not pay to make an attractive exhibit for only one year.

I. E. Shantz & Co. — We are fully agreed with you regarding inadequate accommodation in the Machinery Hall. We might also say that a petition was circulated, and every exhibitor and representative signed it. We hope that a joint effort may induce the board to make the necessary changes.

The Defiance Iron Works Co.—We are quite in accord with your views regarding the erection of a Machinery Hall such as you describe, where the exhibits of machinery could be concentrated and made more attractive and valuable to exhibitors.

The John Bertram & Sons Co.—About fifteen years ago we complained very bitterly of the accommodation granted machinery men at the Toronto exhibition in the present Machinery Hall, and for this reason we have entirely discontinued exhibiting our machinery there. It certainly is of no interest to anyone to go to the expense of getting up ten or fifteen thousand dollars' worth of machine tools, paying freight to Toronto, handling everything over that rotten platform from the railway siding to the building, and going to the expense of belting and arranging to set machinery in motion, under existing circumstances. We have simply got so tired of calling their attention to this fact that we finally decided to cut the exhibition out, so far as we are concerned, for all time to come. If a modern Machinery Hall

were erected, with a railway siding directly into the building, and means of handling machinery provided, we would be then in a fit mood to reconsider, and again patronize the exhibition. You have our best wishes for success in this matter.

The E. Long Manufacturing Co. — Regarding having the Machinery Hall replaced, we have no hesitation whatever in saying that it is certainly badly needed. We consider the accommodation as it is at present is anything but satisfactory, space being very limited, and facilities for handling machinery very poor. We might say here for your information that we tried very early in the season to secure increased space for our exhibit, but were unable to do so, the space being so very limited. We trust you will be successful in the efforts you are putting forth.

The Waterous Engine Works Co.—Regarding the inadequacy of the Machinery Hall of the Canadian National Exhibition, we think your attitude in connection with this building is absolutely correct; we not only think that the building should be larger but think it should contain equipment for the easy handling of heavy machinery, and further, it should have sanitary arrangements for the accommodation of the exhibitors at least.

Clark-Demill Co.—It would certainly be a great improvement to have a modern Machinery Hall in place of the present out-of-date building used for machinery exhibits. We are satisfied it would work to the benefit of the exhibition and also the exhibitors, as the present building is certainly not suitable to show goods in, and your sentiments are ours. We wish you every success.

Canadian McVicker Engine Co. — We believe that your idea of equipping a building with traveling cranes, etc., is the correct one and as the exhibition is a permanent one we would certainly recommend that a good Machinery Hall be built of the latest design and that there be installed in same the latest type of machinery for handling heavy weight.

Toronto & Hamilton Electric Co. — We are pleased to see that you are taking up the matter of accommodation for exhibits and exhibitors in the Machinery Hall at the National Exhibition. We cannot too strongly emphasize the necessity of there being built an up-to-date building into which it is possible to unload heavy machinery without danger to life, to say nothing of the machinery and floors. It was only the other day that the writer saw a wagon loaded with machinery being pulled out of the building by hand when one of the front wheels broke through the 1½-inch flooring of the hall and the other threatened to do the same. Moreover, the sanitary conditions existing, lack of ventilation, etc., are a disgrace to the authorities of the concern. We would suggest that a new hall fitted with cranes and designed to carry heavy machinery should be built. In this hall running shafting with bearings properly spaced (those in the present hall being some 16 feet apart) should be provided in convenient locations, and if possible some convenient method of concealing the wiring used in connection with electrical exhibits should be adopted. We believe also that you do well to mention the confinement of the exhibits to things mechanical, as with the present arrangement no one unacquainted with the building can find what he looks for, no official guide to exhibitors being published, we believe.

Exhibit of Pneumatic Tools.

The only exhibit of pneumatic tools at the Exhibition was that of the Canadian Pneumatic Tool Co., made by their sales agents, N. J. Holden Co., Limited, Montreal. This was the first time that this company had exhibited, and the style of the exhibit this year was certainly a credit to them. Not only was there displayed a large stock of pneumatic tools of all kinds, but there were also practical demonstrations of the operation of pneumatic and electric drills, drilling steel plates. The compressed air for the operation of the pneumatic drills was supplied by a type G. belt-driven compressor, governed so as to automatically maintain a constant pressure in the receiver. The compressor is designed for a pressure of 100 lbs. per square inch, although at the Exhibition it was being operated at less than half that pressure. The electric drills were operated on a 110 volt D.C. circuit.

The exhibit of pneumatic tools, besides the drills, included pneumatic hammers, chippers, riveters, etc., and sand rammers. But the two chief features of the exhibit were the "Little

Canadian National Exhibition—Canadian Pneumatic Tool Exhibit.

Giant" air drills and the Duntley electric drills. The improved "Little Giant" drills were shown, which drills are equipped with simple Corliss valve gear, which has been used considerably in England for this class of work. The valve is driven by tongue and groove in the head in the same way as in Corliss steam engine. This valve is reversible at the handle. The air-cooled Duntley electric drills are adaptable to a wide range of usefulness, because of the handiness of electric power. The motors running the drill spindle are wound for either 110 or 220 volts, and thus the drill can be run wherever an incandescent lighting system is available. A test of one of these drills made recently outside the establishment of the N. J. Holden Co., in Montreal, before a number of interested persons, shows the quickness with which these drills do their work, and the makers claim them to be very economical in power.

This exhibit was quite an educative one for the general public, and at times there was considerable speculation as to what manner of things those might be among the uninitiated in mechanical subjects.

Exhibit of Pipe-Threading Machine.

A very interesting exhibit of pipe threading machines was made by I. E. Shantz & Co., Berlin, Ont., in the Machinery Hall. This firm showed a lathe type of pipe-threading machine, which has new and interesting features, they being the only manufacturers of this style of pipe-threading machine in Canada. The machine was designed by W. R. Hunter, who has had a number of years experience with the Borden Co., and who is now a member of the firm of I. E. Shantz & Co. A valuable feature is that changes of speed can be made while the machine is in operation. It is fitted with the Borden solid adjustable dies. Besides this machine there was a full line Borden hand-power pipe-threading machines exhibited, as well as pipe stocks and dies. The I. E. Shantz Co. are sole manufacturing and selling agents for the Borden Co

The T. & H. Electric Co.

The Toronto & Hamilton Electric Co. made their usual handsome exhibit of electrical machines. These included both direct current and alternating current machines, there being three D.C. machines and 5 induction motors; they also had on exhibit one of their selector switches.

The Smart-Turner Machinery Co., Hamilton.

This firm exhibited quite a complete line of their duplex and other pumps; they also showed a marine engine with shaft and propeller. The exhibit had a very neat and attractive appearance.

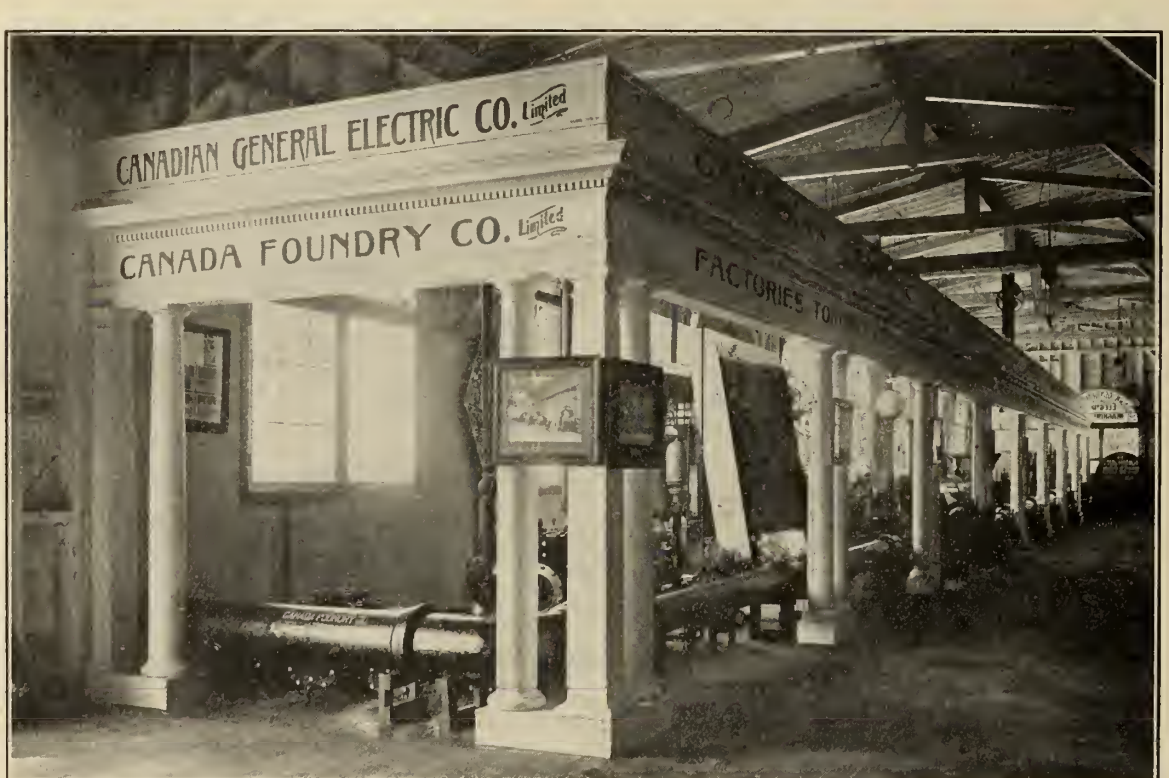
A Saw Mill Machinery Exhibit.

The E. Long Mfg. Co., Orillia, made their usual exhibit of saw mill machinery in the Machinery Hall. The company showed their No. 0 carriage, which is of interest to small lumber manufacturers; and also sections of larger carriages showing different sizes of double-acting set works. They also exhibited a combination lathe machine and bolter suitable for work where it is desired to make lath from slabs.

Canada Foundry Exhibit.

If one were to judge the value of an exhibit by its weight that of the Canada Foundry Co. would be ahead of all, as this enterprising firm had on exhibition in Machinery Hall over 80 tons of was an ore crusher weighing 10 tons; their manufactures. The largest piece is an ore crusher weighing 10 tons, and the smallest a headless set screw weighing 1-10 of an ounce. To show that even larger pieces are made in their large Davenport works, there were shown photographs of locomotives in use by both the C.P.R. and James Bay Railway, as well as some 70-ton steam shovels photographed at work on the James Bay Railway near Aurora. A steel railway bridge on the Guelph and Goderich Railway is shown, one of the spans being put in position by a large steam derrick made by this firm.

The working exhibit consisted of a 500 gallon underwriters pump operating a miniature waterfall. Side by side with this pump was shown the smallest du-



Canadian National Exhibition—Canada Foundry Exhibit.

ETURNED
SEP 28 1905
To Dunn
Book 55
Page 64

plex pump used for feeding steam boilres.

The exhibit was surrounded by a course of cast iron water pipe of various sizes, all connected together and forming a unique and practical application of many special castings used in connection with a waterworks system.

Heald Machine Co. Grinder.

In the space of the Canada Cycle & Motor Co. was shown a Heald grinder made by the Heald Machine Co., Worcester, Mass., on which are ground the piston rings for the gasoline engines of the Canada Cycle & Motor Co. The grinder is provided with an electromagnetic chuck, and it has a micrometer attachment by the aid of which a variation of 1.1000 of an inch can be secured.

Stevens' Tool Grinder.

There was exhibited in the space of the Canada Cycle & Motor Co. one of the standard tool grinders made by the Stevens Co., Galt. The table of the grinder is adjusted in two directions, and has in addition a universal adjustment through a number of degrees.

The Jones and Moore Exhibit.

The Jones & Moore Electric Co., Toronto, had this year an enviable position in Machinery Hall, their space having been changed since last year. They now occupy an end space in the middle aisle and had a very complete exhibit of their machines, both direct and alternating current. Two large D. C. generators supplied power for lighting of several buildings throughout the grounds and also several exhibits in the Machinery Hall. The line of induction motors exhibited was very complete, there being 11 machines ranging from 1 h.p. to 32 h.p. A very attractive feature of the exhibit was the lighting, the space being surrounded by a string of various colored incandescent lamps.

The Garlock Packing Co.

The Garlock Packing Co. had their usual exhibit in the Machinery Hall of packing of all kinds. The exhibit consisted of an attractive booth in which the packing is shown off.

The Dominion Belting Co.

As usual the Dominion Belting Co., Hamilton, had their exhibit of Maple Leaf belting in the Machinery Hall, the exhibit consisting of three large pyramids of belting. They also exhibited their belt dressing.

Fox Bearing.

The Fox Bearings, Limited, of 205 Adelaide St. west, Toronto, occupied a Adelaide street west, Toronto, occupy a booth on the upper storey of the Transportation Building, where Mr. Fox explained its advantages. Amongst other things it can be placed on a shaft without taking off a pulley or hanger. These bearings have been installed and are now running in different places showing what they are capable of doing.

The Canada Metal Co.

The Canada Metal Co., Toronto, manufacturers of babbit metal and lead pipe, made an extensive display of lead traps and bends. This is now one of their leading lines. They are prepared to supply the trade with any size or shape in traps and bends required.

The Canadian National Exhibition Exhibit Canada Metal Co.

The exhibit also included the various sizes of lead pipe made by the company, who carry a very large range of pipe, these being from 1-16 of an inch to 8 inches in diameter. Their Imperial genuine babbit metal is creating a great deal of interest. This is the highest grade babbit metal made. It is in use on large steam engines, dynamos and high-duty machinery. This metal the company guarantees to give satisfaction. They also showed in connection with this babbit, other alloys that are giving satisfaction wherever placed

There was also to be seen plumbers' wiping solder, all grades and shapes; bar lead, block lead, bar tin, battery zinc, fuse wire and all newspaper metals, pig lead and ingot copper.

The general manager, Mr. W. G. Harris, endeavored to show the trade through their exhibit most all goods manufactured by the company, and the exhibit, as can be seen by the illustration, was a very creditable one.

D. K. McLaren.

This company made their usual exhibit of different kinds of belting including leather and rubber belting, and they also showed a line of mill supplies.

A. R. Williams Machinery Exhibit.

One of the most prominent spaces in the Machinery Hall was that occupied by the A. R. Williams Machinery Co. Being directly opposite the main entrance the exhibit was sure to be seen by all entering the hall, and the style of the exhibit this year was such as to command the attention of all interested in machinery, and to awaken the admiration of all, whether directly interested or not. A feature of the exhibit which contributed largely to the effectiveness of the exhibit was the operating of practically all the machines.

The exhibit was a very complete one, representing as it did iron and wood working machinery, powerhouse machinery and engineers', machinists' and mill supplies. Ironworking machinery was represented by a radial drill, a a drill, an automatic gear cutter, an engine lathe, a shaper, a patent safety press, and woodworking machinery was represented by a surfacer and buzz planer.

The radial drill exhibited was a Fostick machine, 48 in., equipped with a new belt-shifting device and new change feed device. The automatic tapping attachment is also a feature. The bolt cutter was a standard McGregor-Gourley machine; the pipe-threading and cutting off machine was one of the R. McDougall standard makes, and the drill was one of the original W. F. & John Barnes tools, 20 in. The gear cutter was a fully automatic tool of handsome appearance, made by Louis Besse, Paris, France. The lathe and shaper were the product of the American Tool Works Co., and both of them being in operation cutting metal, attracted considerable attention. The lathe was one of the up-to-date geared-head lathes of this company, giving 54 changes of speed without stopping the lathe. Demonstrations of the working of the lathe were made with high speed steel tools. The shaper was one of the standard American make, having an 18 in. stroke and operating on cast iron.

A machine which attracted considerable attention was the patent safety press recently placed upon the market by J. B. Hall, Toronto. The novel features of the press are two, one being the safety clutch which, when thrown in, requires that the foot lever be pressed for each stroke of the press, and the other being the swinging of the body of the press from the same centre as the pulley, thus allowing the press to be placed at any angle without in any way changing the drive.

Whenever the Harper eclipse 30-in. single surfacer was put into operation there gathered at once an interested crowd. This surfacer is equipped with a sectional feed roll and chip breaker. The other representative of woodworking machinery was the 12-in. standard buzz planer, made by J. Ballantyne & Son. On this planer was demonstrated the uses of the Jones safety guard, designed to prevent accident to the operator in feeding the material across the knives. This safety guard is made by J. M. Jones, 22 King William street, Hamilton.

Canadian National Exhibition—A. R. Williams' Exhibit.

Representing power house supplies was exhibited a standard Martin duplex pump, made by the Martin Pump & Machine Co., as well as engineers' supplies. This exhibit was completed by a handsome display of engineers', machinists' and mill supplies, which included two pyramids of Reeves' pulleys, steam gauges, valves, oil cans, drill

chucks, chucks, machinists' hammers and vices.

The "King Edward" Machines.

The Consolidated Electric Co., Yonge street, Toronto, made their usual complete and attractive exhibit of "King Edward" dynamos and motors. These included both direct current and alternating current machines, their new style of induction motor being much in evidence. The exhibit was lighted with various colored incandescent lamps supplied with power from a "King Edward" dynamo, run from one of the lines of shafting.

The Babcocks & Wilcox Boiler.

Babcocks & Wilcox exhibited one of their standard water tube boilers equipped with a superheater.

Gould, Shapley & Muir Engine.

The attractiveness of the exhibit of Gould, Shapley & Muir, Brantford, has been much increased by the building of a canopy over their space. They showed a very complete line of their gas and gasoline engines in large and small sizes, and also a line of oil pumps. Their "Ideal" automatic concrete mixer did attract considerable attention, as did also their "Ideal" portable gasoline engine.

Canadian Bearings, Limited.

The Wright taper roller bearings were exhibited in the Machinery Hall by the Canadian Bearings, Limited, Hamilton. This firm also showed a sensitive drill which they manufacture in addition to the roller bearings.

Wettlaufer Bros. & Sons, Limited, Stratford.

An exhibit of lightning cement pressed brick machines and concrete mixers was made by this firm in the Process Building.

Reversible Gasoline Engines.

Something new to the Canadian market is the type of engine shown by the Miller Reversible Gasoline Engine Co. of Toronto. The exhibit was looked after by Mr. M. J. Miller, where four engines were shown. There was one each of 1, 2 and 5 h.p. marine type and one 3 h.p. stationary. These engines are equipped with a reversing lever which makes it run both ways, enabling the use of a solid propeller wheel. A float feed carburetor is used which works automatically. They are built in sizes from 1 to 25 h.p. for the marine engine and 3 to 35 h.p. for the stationary.

Gasoline Pumping Plants.

In the Montcith-Nixon Co.'s exhibit in the Process Building was shown adaptability of the gasoline engine for small isolated pumping plants. A 2 h.p. International Harvester Co.'s engine was shown running a small pump. This is a particularly desirable outfit for pumping water into an upper tank or reservoir either for manufacture or for a hotel or Summer resort.

The James Morrison Brass Exhibit.

For brilliancy and artistic effect, the brass and plumbing goods exhibit of the James Morrison Brass Mfg. Co. could have no equal. The lighting fixtures contributed very largely in the production of this brilliant effect, but the highly-polished brass goods reflected the rays of light from the numerous electric lights, and thus also contributed their share towards the production of the brilliant effect. The display of brass goods included all kinds of engineering supplies, as well as other lines; and these supplies included injectors, valves of all kinds, both brass and cast iron, steam gauges, steam engine indicators, steam whistles of various kinds and sizes, revolution counters, oil cups, water gauges, locomotive bells, etc.

One of the chief features of the exhibit was the display stand of J.M.T. valves of all kinds, which had a very handsome appearance. Another important feature was the improved Thompson steam engine indicator, which is provided with a reducing motion mechanism gotten up by this firm. The lines of steam gauges handled by the firm were handsomely displayed on the real wall of the space, together with revolution counters and other engineers' supplies.

Of late years this company have made great strides in the manufacture of artistic gas and electric fixtures, so that their display of these goods included many fixtures which compare very favorably for beauty in design and workmanship with the finest of imported lines.

Carbon Paint.

On the second storey of the Transportation Building Depew's carbon paint was shown. The works of this company are situated on Queen street west, Toronto. This paint is suitable for machinery of all kinds, brick, metallic or other exposed surfaces.

The Canadian National Exhibition—James Morrison Brass Exhibit.

The Pendrith Machinery Co.

The Pendrith Machinery Co., Toronto, had two exhibits, one in the Machinery Hall and one in the Process Building. In the Process Building the company gave a practical demonstration of the operation of their bakers' machinery; and in the Machinery Hall, besides exhibiting bakers' machinery, they showed a line of tool grinders.

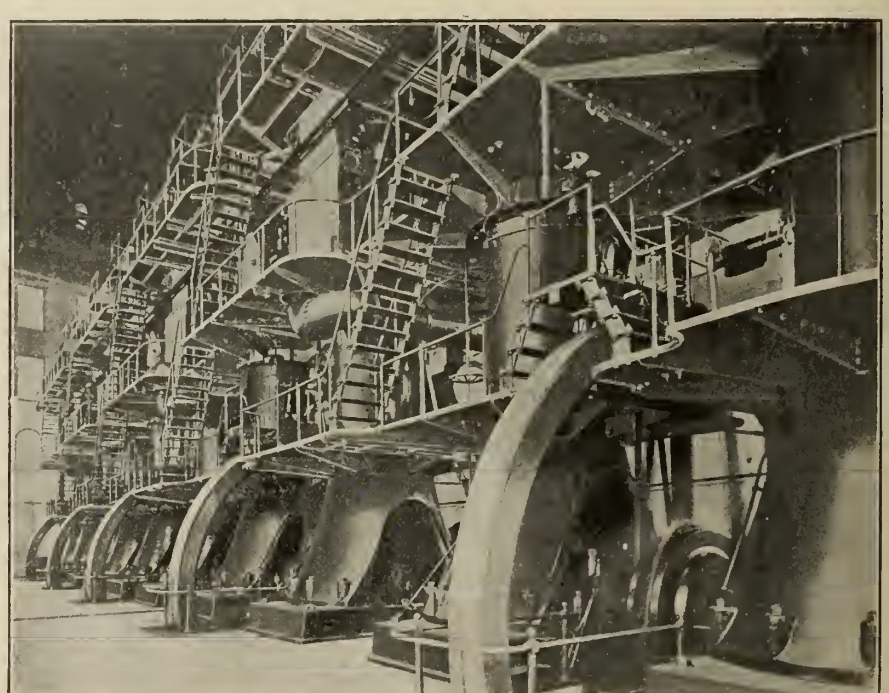
Power and Transmission

Steam Gas Electricity Compressed Air Water

ALLIS-CHALMERS BLOWING ENGINES.

THE accompanying illustration shows the most recent development of the Allis-Chalmers blowing engine. The history of the development of this engine is a record of an achievement of which the Allis-Chalmers Co. might well be proud. This type of engine has been designed by Mr. Edwin Reynolds, and the first work on it was done in the early eighties. He has practically revolutionized the construction of these engines, so that the long cross-head type of engine, the compound steeple blowing engine, and their compound horizontal unit have come to be acknowledged as embodying the standards of blowing engine practice. The demand which these engines have had from the large iron and steel companies in the United States is a good proof of their reliability and economy.

Some statistics in reference to these engines will indicate the tremendous aggregate of power which iron and steel companies utilize in this way for the production of their output. The total normal output of air per minute from the air cylinders of Allis-Chalmers blowing engines used in the United States by iron and steel companies is approximately 2,000,000 cubic feet. The enormity of this volume can be better appreciated in the statement that it represents a tube of air having a cross section of one foot and a length of 380 miles. The aggregate horse power of the steam cylinders of the same engines (under normal conditions) is over 50,000.



Allis-Chalmers Blowing Engines.

ADDITION TO THE OTTAWA ELECTRIC LIGHT PLANT.

A POWER installation of considerable interest which has recently been installed is an addition to the equipment of the steam power station of the Ottawa Electric Co. This addition consists of a Westinghouse terbo-generator of 1,500 k.w. capacity. This unit was installed to serve as an auxiliary to their present water power equipment, and to take the peak of their lighting load during the Winter months when water is low. The complete equipment consists of three 400 h.p. Babcock & Wilcox water tube boilers, a 2,250 b.h.p. Westinghouse-Parsons turbine direct connected to a Westinghouse rotary field, two-phase generator of the above named capacity, and a barometric condenser with dry air pump, supplied by the Jno. McDougall Caledonia Iron Works Co. The steam pressure used is 150 lbs. The boilers are not equipped with superheaters, but to insure dry steam being supplied to the turbine the steam trap is placed directly under the main inlet valve of the turbine.

A short description of the steam turbine may be of interest. It is one of the Westinghouse-Parsons standard type. An interesting feature is the provision of a secondary governor valve which is automatically opened to allow the passage of high pressure steam to the low pressure end of the turbine, by which means a full load may be developed while running noncondensing, or a 50 per cent. overload while running condensing. There is also an auxiliary governor operating an automatic cut-off valve which closes off the steam supply in case of the turbine attaining a greater speed than safety would allow. Within the load limits of the turbine the governor is adjusted to regulate within 4 per cent. of average speed. The guaranteed steam consumption of this turbine is 15.3 lbs. per b.h.p. at full load.

THE MILLER IMPROVED GAS ENGINE.

THE accompanying illustration is of the Miller improved gas engine as recently placed on the market by the Miller Improved Gas Engine Co., Springfield, O. These are heavy duty engines of the four-cycle type, built in sizes 50, 75, 100 and 150 h.p. The engine is built up by placing two beds side by side and yoking them together. The method of governing is by throttling, and the method of ignition is by the jump spark system. The governor is a small centrifugal one controlling the action of the throttling piston by regulating the supply of air to the vacuum pump. The current for the electric spark is supplied by a storage battery, and the point of ignition can be changed as desired while the engine is in motion.

The valves, both inlet and exhaust, are poppet valves, the inlet being operated by the suction stroke of the engine, while the exhaust are mechanically operated, being, however, balanced to prevent undue strain on the mechanism operating them. The action of the exhaust valves are controlled by dash pots to prevent undue hammering. The mixing chamber is situated beneath the throttling chamber, which is located between the two inlet chambers, and is equipped with a mixing valve through which any desired proportion of mixture can be obtained by the operation of a small lever.

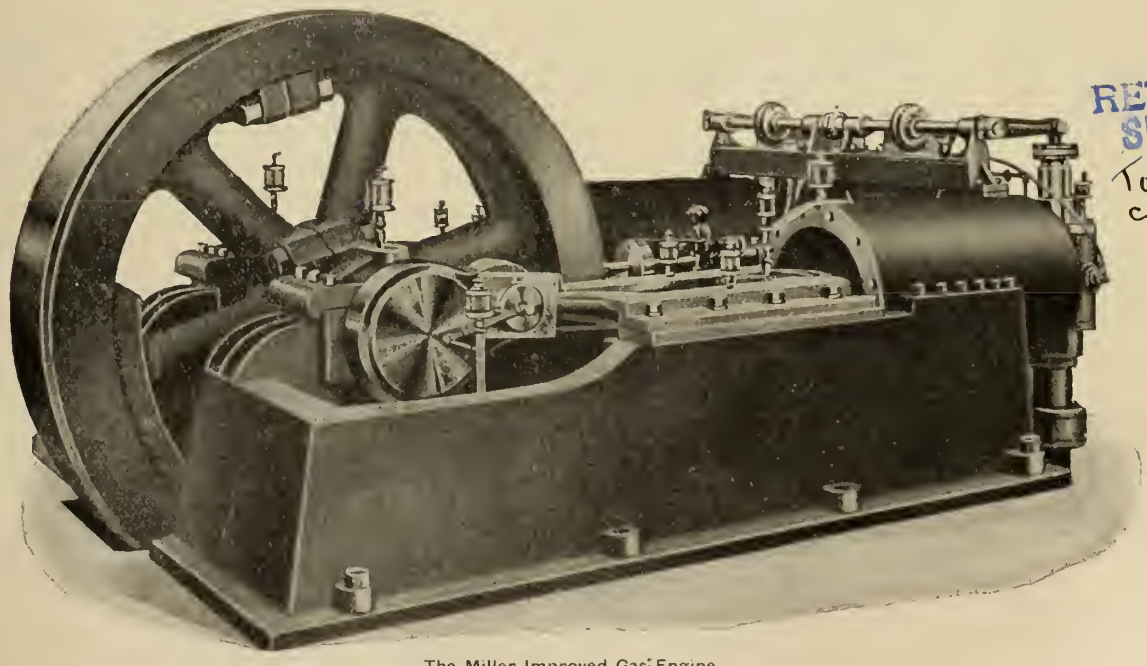
The cylinders and water jackets are separate castings secured to the beds by cap screws. The pistons are provided with four snap rings each. Cross-heads and guides are used in the engines, the shoes of the cross-heads sliding between upper and lower guides. The shoes are swivelled on the ends of the cross-head wrist pins. The bearings are babbit lined and are peaned to compensate for shrinkage, after which they are bored by means of a boring bar through the two boxes after the beds are lined up on the erecting floor. The fly wheels are made in halves, and bolted and keyed to the shafts.

THE IMPERIAL GAS ENGINE.

THE accompanying illustration is of the Imperial gas engine, sold in Canada by H. W. Petrie, Toronto, and which is built especially for him. Complete combustion of fuel, as was evidenced by its exhausting into the building without the usual accompanying odors; the simple method of governing, whereby any speed from 100 to 600 revolutions per minute can be obtained while the engine is in operation; and its simplicity of construction and smooth running qualities.

The Imperial Engine.

The vaporizer is a solid brass casting, the quantity of gasoline being controlled by a screw on the top. A point of interest about the connecting rod is that the upper end is fitted with phospher bronze boxing, while in the lower end babbitt metal is used. The method of lubrication is by the splash oil system, and also by sight feed lubricators. The jump spark system of ignition is used on these engines. The governing was spoken of before, and is of the hit and miss type. These engines are guaranteed for one year, and within that time any defective parts will be repaired or replaced, providing they are not caused by misuse or neglect.



The Miller Improved Gas Engine.

This engine was exhibited at the exhibition, and there attracted considerable attention because of one or two features which it possesses. These features are:

NEW ELECTRIC RAILWAYS.

ELECTRIC railway extensions of importance are being projected in the lower Fraser Valley and some of them will, if installed, mark the inauguration of long-distance electric lines in the province. The most important is the projected line up the Fraser to Chilliwack, a distance of 60 miles or more. This line will be on the south side of the river and will run all the way through a good farming and ranching district, which indeed is the general character of the whole section between the Fraser River and the international boundary as far east as Chilliwack. There are a number of prosperous settlements there already, but absence of any practical means of transportation, with exception of the river steamers, has always been a drawback to large settlements and to development of land.

The other projected line is from Eburne to New Westminster, on the north side of the Fraser River. This undertaking will be carried out by the C.P.R. which has a charter for a line, which will run either on the mainland from Royal city down the river or else on Lulu Island, practically to the seacoast, a distance of some fifteen miles.

Industrial Progress

MACHINERY AND INDUSTRIAL NEWS would be pleased to receive from any authoritative source industrial news of any sort, the formation or incorporation of companies, establishment or enlargement of mills, factories or foundries, railway or mining news, etc. All such correspondence will be treated as confidential when desired

The Galt Mallcable Iron Works have started operations.

A new furniture factory is to be erected in Waterloo, Ont.

Barber & Co., Vancouver, are erecting a new mattress factory.

A board of trade has been organized at North Vancouver, B.C.

Barthelmes & Co. will erect a piano action factory in Toronto.

A new saw mill is to be erected near the head of False Creek, B.C.

The St. John Lumber Co., St. John, N.B., will erect new saw mills.

The Government are installing new machinery in the mint at Ottawa.

The Verity Plow Co., Brantford, will build an extension to their factory.

The Prince Edward Island Railway are erecting a car shop at Charlottetown.

The C.P.R. have commenced extensive additions to their docks at Port Arthur.

The Hamilton Distillery Co. will erect a seven storey building to cost $26,000.

The C.P.R. are about to erect a new saw mill at Holsmer near Fernie, B.C.

The planing mill of Alderman Gerry, London, Ont., has been destroyed by fire.

The Canada Cycle & Motor Company will extend their plant at Toronto Junction.

The Dowswell Mfg. Co. will build a warehouse to cost $3,000 in Leamington, Ont.

Gowans, Kent & Co., Toronto, are erecting a large factory on King street, west.

Spout, Waldron & Co., Minneapolis, will build a flour mill at Lethbridge, Alta.

A company has been organized in Regina for the manufacture of sand-lime brick.

Shurley & Dietrich, Galt, have under way the construction of a large new factory.

The linseed oil plant of the Sherwin Williams Co., Montreal, is now nearly completed.

The Massey-Harris Co., are erecting a new storage building in Brantford to cost $3,000.

A large new commercial block will be built by J. W. Horn in Vancouver, to cost $25,000.

The Great Lakes Navigation Company will build a $50,000 shipbuilding plant at Fort William.

The sawmills of the W. J. Hesson Company at the Soo were destroyed by fire. Loss $10,000.

The Waterloo Threshing Machine Co. will erect a warehouse and repair shop at Portage la Prairie.

R. C. Fuller & Co., chemists, Amherst, N.S., are making improvements to their works to cost $2,000.

It is expected that an oil refinery will be established at Chatham, Ont., within a very short time.

McLean Bros., Vancouver, are to build a large saw mill near the mouth of the Fraser River.

The by-law to give a loan of $25,000 to the Canadian Bearing Co. was passed by Woodstock ratepayers.

The Lethbridge Coal Mines Co., Lethbridge, Alta., will improve their plant to the extent of $75,000.

Schram & Brown have commenced the manufacture of cement brick by a new process at Medicine Hat.

The ratepayers of Calgary will vote on a by-law to raise another $10,000 for the municipal power plant.

It is reported that a valuable discovery of copper has been made near the old Bruce Mines in Ontario.

The Nelson Iron Works, Nelson, B.C., will build a large new works to keep up with their increasing orders.

Waterloo, Ont., has carried a by-law to spend $5,000 for a third storage tank for their waterworks system.

The foundry of F. E. Middleton, Ridgetown, was badly damaged by fire. It was covered by insurance.

Net earnings of the Granby smelters during the fiscal year ending June 30, 1906, amounted to $1,800,000.

The new smelting plant of the British Columbia Copper Co., Limited, Phoenix, B.C., is just about completed.

The building of the plant of the Montreal Smelting & Refining Co., at North Bay, is now well under way.

D. Drysdale will erect a new saw mill on Queen Charlotte Island, with a capacity of 150,000 feet per day.

The Village of Hastings will vote to grant a bonus of $5,000 to the Peterborough Boiler & Radiator Co.

The Massey-Harris Co. are making an extension to their storage building in Brantford, to cost about $20,000.

The French firm of St. Frere are considering the establishment of a plant in Canada for the manufacture of bags.

A new concentrator has been installed by the Montezuma Mining & Milling Co., Kaslo, B.C., at a cost of $45,000.

The Canadian Ship Building Co., Toronto, are negotiating for property in order that they may extend their plant.

W. D. Robb, superintendent of motive power, G.T.R., says that the Stratford shops will not be extended at present.

Applications for 20,000 horse-power have been forwarded to the Hydro-Electric Commission by different municipalities.

Port Colborne, Ont., residents have carried a by-law giving concessions to the Great Lakes Portland Cement Company.

Welland, Ont., citizens have passed a by-law granting concessions to the Iroquois Motor Car Manufacturing Company.

John Pillans Carluke, Scotland, says that he intends locating a factory in Canada for the manufacture of bolts and screws.

The St. George Pulp & Paper Co., St. George, N.B., will erect a new saw mill, to replace the one burned down recently.

The Boundary Iron Works Foundry, Grand Forks, has been destroyed by fire. The loss will be in the vicinity of $25,000.

The Canadian Oil Co. are considering the establishment of a branch warehouse and office at either Port Arthur or Fort William.

The Smart-Turner Machine Co. are supplying the Locomotive & Machine Co., Montreal, with three belt-driven vacuum pumps.

The steel plant of the Northern Iron & Steel Co., Collingwood, Ont., has been started up after a period of idleness of about two years.

The James Bay Railway has now been completed as far as Parry Sound, and recently D. D. Mann made a first trip on the road.

The Sage Storm Front Company, of Rosini, Ohio, has started a factory in St. Thomas for the manufacture of buggy coverings.

A new planing mill is to be erected in Stratford for T. M. Ruston to cost $10,000. Building operations have already been commenced.

The Columbus Cobalt Silver Mines are installing a complete steam power plant, consisting of boiler, steam drills, steam pumps, etc.

Waterloo, Ont., has passed a by-law to loan the Interior Hardwood Furnishings Company $10,000 without interest, repayable in ten years.

The Dominion Carriage Co. have commenced work on their new plant at Toronto Junction. They expect to occupy it by the Spring.

The Peterborough Steel Rolling Mills Company is asking the City of Peterborough for a bonus of $6,000 and a right-of-way for a siding.

The Canadian Lock Nut Co., Pearl street, Toronto, have purchased the business and plant of the Canadian Nut Co., Adelaide street west, Toronto.

McLean, Holt & Co., St. John, N.B., are about to put up a manufacturing plant on Courtenay Bay. The new property has a frontage of 700 feet.

The contract for the construction of the new Y.M.C.A. building in Calgary, Alberta, to cost $55,000, has been let. Work on the building has commenced.

The output of steel rails from the rail mill of the Lake Superior Corporation during the past fiscal year has been 62,000 tons in excess of that of last year.

Brandram-Henderson, Limited, have finally decided to locate their lead corroding plant in Montreal, and building operations will be commenced at once.

The Canadian Westinghouse Co., Hamilton, are having a single beam hand-power traveling crane installed by Smart-Turner Machine Co., Hamilton.

The wood working factory of C. W. Gibbs, Winnipeg, has been completely destroyed by fire, including all the machinery. The estimated loss is $10,000.

J. O. Walker and others, of Goderich, ask that town for a loan of $20,000 with which to build a carriage factory. The by-law will be voted on at New Year.

G. E. Bradshaw, of Toronto, representing an American company, is seeking franchises in Galt and other towns to establish central heat transmitting systems.

Moose Jaw has voted $90,000 for the purpose of bringing water from Snowdis Springs to Moose Jaw by gravitation. Snowdis Springs is seven miles from the city.

Prince Albert council will submit a by-law to grant $25,000 to the C.N.R. for the purpose of assisting in the building of a traffic bridge across the Saskatchewan.

Negotiations are in progress for the establishment of a manufacturing plant at Goderich, Ont., by an American firm for the manufacture of baby carriages, go-carts, etc.

The Boundry Iron Works Foundry, Grand Forks, has been completely destroyed by fire together with the machinery installed. The loss will be at least $35,000.

The Town of Qu'Appelle is considering the question of granting a franchise to the Moore Milling Co. for the installation of an electric lighting plant for that town.

Quinlan & Robertson, of Montreal, are the lowest tenderers for the lock and dam to be constructed at St. Andrew's Rapids, near Winnipeg, at a cost of about $500,000.

The Peterborough Boiler & Radiator Co. will locate in Hastings, Ont., on the condition that the village grant them a bonus of $5,000, and exemption from taxation.

The firm of Sinclair & Morrison, Montpelier, Ind., propose to establish a plant in Chatham, Ont., for the manufacture of drillers' tools and supplies to supply the oil district.

The Town of Leamington, Ont., is considering a proposition to lend a Detroit company $30,000 to assist them in manufacturing automobile brass goods and trolley wheels.

The London Fence Co. have let the contract for their fence factory at Portage La Prairie to Carr & Woodman for the brick work and A. McLarty for the carpenter work.

The Waterloo Manufacturing Company have announced their intention of building a storehouse and factory at Portage La Prairie if they can get tax exemption for twelve years.

The corporation of Gravenhurst will develop a waterpower at South Falls, on the Muskoka River, and will transmit the electric power to Gravenhurst, a distance of eight miles.

The Montreal Power Company will before the end of the year lose the street lighting contract of Westmount, a suburb of Montreal, which is building a municipal lighting plant.

The contracts for the bridges on the Transcontinental Railway have been divided, the Dominion Bridge Works Co., and the Locomotive & Machine Co., each building four.

The Ontario Power Co., Niagara Falls, will proceed at once with the completion of the first section of their plant. This will mean the installing of three more turbines and generators.

It is announced that the Ames Holden Co., Limited, will devote a portion of their recently increased capital to the building of a new factory at Montreal, to cost about $200,000.

The Canadian Fairbanks Co., are installing a suction gas plant for supplying power and lighting in the new automobile building of Henry Morgan & Co., on Beaver Hall Hill, Montreal.

Work will be commenced at once on the transformer building of the Canadian General Electric Co., Peterborough, by the contractors, the Dominion Engineering & Construction Co., Montreal.

The contract for the erection of shops and stores buildings for the Intercolonial Railway at Moncton, N.B., has been awarded to E. A. Walberg, Montreal, the contract price being about, $160,000.

The leading citizens of Emerson, Man., are promoting a scheme to develop waterpower on the Rossean River, 22 miles from the town. The scheme has been pronounced feasible by competent engineers.

The increase in duties on agricultural implements imported into Australia is likely to seriously affect the Massey-Harris Company, which concern has for years done an enormous trade with the sister colony.

The Dominion Construction Company, of Montreal, have the contract for the new transformer building for the Canadian General Electric Company at Peterborough. The building and equipment will cost about $250,000.

This year has been the best in the history of the Canadian Pacific Railway. The annual report shows gross earnings of $61,669,758 with working expenses of $38,696,445, leaving net earnings of $22,973,312.

The Town of Cardston, Alta., has purchased from Allis-Chalmers-Bullock, Limited, of Montreal, an electric and water works plant, including generator, switchboard, transformer, lights, and a special compound duplex pump.

The Bain Wagon Co., Woodstock, Ont., are preparing to make a large extension to their plant. The addition will be 120 feet long by 60 feet wide; and 50 additional men will be employed in the Spring of the coming year.

The Detachable Boiler Flue Mfg. Co. have decided to locate their factory at Portage la Prairie. J. M. Crozier is secretary and manager of the company. The factory will be commenced at once and finished, it is expected, in ninety days.

The plant of the Pacific Steel Co., Irondale, B.C., has been sold to Jas. A. Moore for $40,000. Mr. Moore states that the plant will be improved to the extent of $100,000, its capacity being increased to 60 tons of pig iron per day.

The Great Lakes Portland Cement Co., Limited, are to establish a plant in Port Colborne Ont., for the manufacture of Portland cement. Building operations will commence at once but it will be a year before any cement is made.

The Berlin Electrical Mfg. Co., manufacturers of the "Best" dry batteries, have moved from Berlin, Ont., to 474 to 478 King street west, Toronto. In their new quarters the company will have three times the floor space that they had before.

The Maritime Coal, Railway & Power Co. propose to build an thermo-electric power station at their coal mines in Nova Scotia for the generation of electric power from coal, to be transmitted to Amherst, Moncton and intermediate points.

Wm. C. Campbell, Detroit, will equip a factory in Leamington, Ont., for the manufacture of gasoline engines, marine and automobile, and brass and bronze goods. He expects that he will be ready to manufacture by the first of the coming year.

The A. R. Williams Machinery Co., have been appointed Toronto agents for the Dominion Brazing Co., Montreal; and at the A. R. Williams plant on Front street brazing will be carried on according to the process of the Dominion Brazing Co.

The Multi Scale Co., of Guelph, who have recently been incorporated, will engage in the manufacture of what is known as the multi scale. They also purpose making casting of all kinds, and the smaller parts of agricultural and other machinery.

The Cobalt "Silver Queen" has purchased from Allis-Chalmers-Bullock, Limited, Montreal, through the Toronto

office, an electric lighting outfit including a "Bullock" generator driven by a high-speed automatic engine and additional boiler equipment.

A by-law will be submitted to the residents of Hastings, Ont., asking them to give a bonus of $5,000 and tax exemption for ten years to the Peterborough Boiler & Radiator Company, who will establish a plant to cost $75,000, and employ 25 hands.

The action of the Australian Government in placing a fixed duty of £12 on harvesters and a duty of 25 per cent. on other agricultural implements, will effect Canadian trade with Australia not a little, as agricultural implements constitute the big item of trade.

The Canadian Ethinite Co. are making arrangements for the building of a large factory at Niagara Falls, Ont., where they will make "ethinite," the product having similar properties to calcium carbide, which will be used in the making of acetylene gas.

Niagara Frontier Oil & Gas Co., organized under a charter from the State of New York, have been authorized by license from the Ontario Government to carry on the business of oil refiners, etc., in this province. Wm. G. Ryan, of Leamington, will be their attorney.

The Amherst Foundry Co., Amherst, N.S., are making an addition to their foundry building, the size being 75 x 60 feet. This addition to their foundry will enable the company to largely increase their output of enamelware. The cost of the addition will be $4,500.

The Cooper Gasoline Engine Co., Limited, of Winnipeg, Man., are installing a 60 h.p. "Weber" double cylinder vertical gas engine and suction gas producer plant for Messrs. Horn Bros., Markinch, Sask., to operate their new roller mill and elevator at that point.

The Ontario Iron & Steel Co. have let the contract for the construction of its new plant at Welland, Ont., to the Berlin Construction Co., Berlin, Conn. The contract price is $265,000. In its new plant the company will manufacture steel rails, steel plates, bars and angles.

The Standard Gas Engine Co., Marsh Lane, Preston, Eng., are thinking of establishing a plant in Canada for the manufacture of internal combustion engines of all kinds, and are desirous of getting in touch with Canadian engineering firms who would be prepared to establish this plant.

At the annual meeting of the Montreal Reduction & Smelting Co., of Canada, held in the companies offices, St. James street, Montreal, early in the month, the following directors were unanimously elected: J. E. Leonard, M.P., J. H. Brown, O. Lemire, Benjamin Burland, L. J. Carter, O. Robert and P. A. Theriault.

The output of the Cape Breton coal mines this season surpassed all expectations. According to the official statement no less than 67,000 tons of coal have been carried from North Sydney to St. Lawrence ports since the opening of navigation up to Aug. 15, as against 37,500 tons for the corresponding period last year. The company has at work a fleet of twelve vessels and this will be

The Meisel Mfg. Co., of the State of Michigan, are to establish a plant at Port Arthur. This company will manufacture flour mill machinery, saw mill machinery, heavy farm machinery, and other lines. The plant is to be ready for operation by May 1907, and will employ 150 men. The total cost of the plant will be in the vicinity of $100,000.

A United States company who manufacture steel forgings are negotiating with the Town of Welland, Ont., for the location of a plant there. Their agent is Thos. J. Dillon, Titusville, Pa. The company ask a free site, free water, free sewer connections, and a fixed assessment. The Supreme Heating Co. are also negotiating with that town on the same terms.

There are about twenty men at work developing the limestone areas at Irish Cove, N.S. These areas are owned by the Nova Scotia Coal & Steel Co. The limestone is being tested at the furnaces at Sydney Mines, and is said to give fairly good satisfaction. Should it be more entirely so the property will be developed extensively and a large force of men employed.

Among the orders received by the Smart-Turner Machine Co., Hamilton, for their standard duplex pumps, are orders from E. Leonard & Sons, London; Loveland & Stone, Cutler, Ont.; the Lake Simcoe Dredging Co.; E. D. Smith, Beamsville, Ont.; the Parry Sound Lumber Co., Parry Sound, Ont.; Fairgrieves, Limited, Toronto; the Breihaupt Leather Co.; and the Farrar Transportation Co.

The Quebec and Lake St. John Railway has a charter for the construction of a tunnel under the Straits of Belle Isle and for the construction of a line of railway through the Labrador Peninsula to the eastern boundary of the Province of Quebec. They also have a charter for the construction of a railway from the boundary of the Canadian and Newfoundland Labrador to the Straits of Belle Isle.

The Town of Niagara Falls, Ont., is considering the proposition of granting the Canadian Ramapo Iron Works a bonus of $3,000 and a fixed assessment of $1,000 for ten years. This company is a branch of the American company, having plants at Hillburn, N.Y., and Niagara Falls, N.Y. It is capitalized at $300,000. Wallace Nesbitt, K.C., for Hamilton, is president, and F. W. Snow, treasurer and general manager.

A new electric turbine pump has been installed at the McTavish reservoirs, Montreal. It is driven by a 400 h.p. induction motor, built by Allis-Chalmers-Bullock. Some time ago, the city had an electric pump on this spot, but it had to be abolished on account of the unpleasant vibrations made by it. The new installation has been tested by Prof. Herdt and the superintendent of the water department and it has been found to be satisfactory.

It is reported that the Canadian Pacific Company has decided to await the outcome of experiments by the New York Central and New York, New Haven & Hartford Railway Companies before taking steps for the electrification of any part of its system. Both the latter railways are spending enormous sums upon experiments, the former with a direct and the latter with a single-phase alternating current. The line from Montreal to Quebec will in all probability witness the first installation. All the electric power necessary can be obtained from the Shawinigan Falls.

It is announced that a combination of Scotch and English steel tube manufacturers to regulate the home and export business has been formed, with a view to abolishing the present keen competition. The industry has suffered incalculably since the previous agreement between the firms in this line was cancelled 18 months ago. The new agreement is wider in its scope than the old one, taking in all the firms in the United Kingdom except one Clydeside concern. It is expected that an advance in prices will soon be announced, as it is believed the agreement carries permanency with considerably increased by next season. it.

Among recent sales by the electrical department of Allis-Chalmers-Bullock, Limited, Montreal, were a 260 k.w. engine type, alternating current generator, with exciter, switchboard, etc., to the Western General Electric Co., Red Deer, Alta; 300 k.w. engine type alternating current generator, with exciter and other accessories, to the Corporation of Barrie, Ont.; 300 k.w. engine type alternating current generator and 25 k.w. exciter, to the Belleville Portland Cement Co.; 125 k.w. engine type alternating current generator, exciter, etc., to the City of Greenwood water works; 62½ k.w. engine type alternating current generator, switchboard, etc., to C. P. Walker, Winnipeg; 125 k.w. engine type alternating current generator, five 10 h.p., three 15 h.p. and one 20 h.p. induction motor, to P. Burns & Co., Calgary.

The Yukon Consolidated Goldfields Co., Limited, have contracted with the Canadian Westinghouse Co. for the following electrical apparatus to be used in gold dredging in the Yukon Territory: Three 100 h.p., 3-phase, 60 cycles, 400 volts, type F motors; three 15 h.p., 3-phase, 60 cycles, 400 volt, type F motors; three 50 h.p., 850 r.p.m., 3-phase, 60 cycles, 400 volt, constant speed induction motors; three 30 h.p. motors; three 20 h.p., 1,120 r.p.m. motors; three 15 h.p., 850 r.p.m. motors; three 7 1-2 h.p., 1,700 r.p.m. motors; nine 75 k.w. oil insulated, self cooling transformers; two 625 k.w., 3-phase, 60 cycles, 2,200 volt, 415 r.p.m., A. C. generators, and two 17 k.w., type S, exciters for same; one 4-panel switchboard for controlling above; four 250 k.w., oil insulated, oil cooled transformers, and four 200 k.w transformers, same type.

* * *

A Correction.

In last month's issue it was stated that the Economic Power, Light & Heat Supply Co., Toronto, were preparing to build the Pintsch suction gas producer

in Canada and also the National gas engine.

It is not correct that the National gas engine is to be made in Canada; the company will make the producer but will import the engine.

* * *

New Machine Shop and Foundry.

The Madison Williams Foundry Co., have removed from Port Perry to Lindsay, Ont., and in the latter place are building a new plant, consisting of a machine shop, 80 x 130 feet, a foundry, 60 x 55 feet and a pattern shop 40 x 60 feet. The buildings are brick with concrete foundations. The steel for the buildings is being supplied by the Walkerville Malleable iron Works. The machine shop is equipped with a traveling crane The company will manufacture water wheels and heavy machinery of all kinds.

* * *

New Catalogue.

The Chicago Pneumatic Tool Co. announce the fact they will receive from the printers on Sept. 15 their new compressor catalogue, consisting of 118 printed pages, printed in two colors, in which several new types and sizes of compressors are shown including their new Hamilton Corliss machines. Those interested will receive copy upon request.

Owing to the rapidly increasing demand for its products throughout the Southern States, the Chicago Pneumatic Tool Co. have opened an office at 1012 Memphis Trust Building, Memphis, Tenn., in charge of J. Francis Small.

* * *

Foreign Patent.

The following is a list of Canadian patents recently granted to foreigners through the agency of Marion & Marion, Montreal: Jules R. Blum, Paris, machine for removing dust by suction from carpets, etc.; G. C. E. de Bonnechose, Paris, turbine engines; Geo. Hutchinson, Seatoun, New Zealand, milking machines; G. F. Jaubert, Paris, methods for utilizing steam boilers for the propulsion of submarines; Dr. Franz Stolze, Charlottenburg, Germany, hot air engines; Vereulen Claes, Beveren, Belgium, ploughs; G. E. Humphries, Wellington, New Zealand, scaffolding brackets; Summers Brown, London, frame for use with rotary duplicating machines.

* * *

Sherardizing.

Sherardizing is the name given a new process for the prevention of iron and steel corosion. While the results are the same as either hot or cold galvanizing, the method is said to be cheaper, more convenient, and gives a better coating. An interesting feature is that iron and steel can be coated with an even deposit of zinc at a temperature several hundred degrees below zinc's melting point. The first step is to free the iron from scale and oxide by any familiar method. It is then placed in a closed iron receptacle charged with zinc dust, which is heated to a temperature of from 500 to 600 degrees, turned for a few hours, and allowed to cool. On removing the iron it is found coated with a thin homogeneous covering of zinc, the thickness depending on the temperature and the length of time. The temperature required is about 200 degrees below the melting point of zinc, this low temperature rendering the process cheap as compared with the dipping process. It has the additional advantage of not deteriorating the iron or steel of small sections to the same extent as hot galvanizing; and there is no loss of zinc dust. The process is not limited to the coating of iron with zinc, since it has already been successfully applied to coating iron with copper, aluminum, and antimony. It has also been used to coat other metals, such as aluminium and copper with zinc. Copper and its alloys, treated in this way, are case hardened on the surface, and can be made so hard as to turn the edge of tool steel.

Dominion Pressed Steel Co.

The Dominion Pressed Steel Company, of Port Elgin, Ont., have their shovel plant about ready for work. The factory is built of concrete, 50 by 160 feet. The main building is three storeys high with a felt and gravel roof, and concrete floor on the lower flat. There will be seven furnaces at the commencement, run with oil fuel. The oil is atomized by an air blast furnished by a Sturtevant fan. There will be four power hammers, two of 600 pounds, one of 400 and one of 100 pounds. There will also be eight power presses. The strop rolls is a ponderous machine put in at great expense. A separate building will contain machinery for making their own handles. The workshop will have two power lathes, planer, drill, grinder and forge. A 100 h.-p. Goldie-McCulloch engine with two boilers will supply the power.

* * *

The A. L. A. M. Standard Screw.

The Association of Licensed Automobile Manufacturers, New York, are distributing all over the United States and Canada copies of the specifications for the new standard screw for automobile manufacturers, which new standard has been evolved from the old U. S. standard screw. There is nothing revolutionary in the new standard which even conforms to the general practice of many machine tool and automobile builders. The reason for adopting this standard is that a finer thread than that of the U. S. standard has been found necessary in many classes of work and the new thread is designed to meet that need.

Considerable study was put on the dimensions of the nuts and heads; careful destructive tests were made before the standard was adopted, to make it absolutely certain that the nuts and heads were large enough and that the threads would not strip. Tests were made with ordinary material and with the material it is proposed to use for automobile work. The results were the same in both cases; that is, the screw broke at the base of the thread inside the nut, which was to be expected.

The association expect that the new standard will gradually come into use for the purpose for which it was designed.

* * *

Largest Generator.

The largest generator ever made in this country has just been made ready for shipment to British Columbia from the works of the Canadian Westinghouse Co., of Hamilton. The purchaser is the British Columbia Electric Railway Co., of Vancouver. The generator is 2,000 horsepower, 3 phased, 7,200 alternations, 200 revolutions per minute, engine type for direct connection with the water wheel. The order also includes one rotary converter of 1,350 horsepower, 550 volts, 3 phase, 7,200 alternations, 400 revolutions per minute, and eight air blast transformers each of 733 horsepower, 2,200 volts to 24,200 volts, 7,200 alternations. The necessary switchboard and regulating and controlling devices were also manufactured in this plant.

* * *

Sales Offices in Toronto.

An evidence of the growth of the London Machine Tool Co. was the recent construction of their new plant at Hamilton, with greatly increased facilities for the manufacture of their machine tools; and now a further evidence is the opening up of sales offices at room 1206 Traders' Bank Building, Toronto. From these sales offices will be sold machinery of all kinds, as well as the machine tools from their own manufacturing plant. Several exclusive agencies in the lines of wood-working and iron-working machinery have already been secured, while at present negotiations are being conducted with a view to others. Among these agencies are the Kempsmith Milling Machine Co., Milwaukee, and the Sibley Machine Tool Co., South Bend, Ind.

* * *

A New Manufacturers' Agency Firm.

A new firm of manufacturers' agents has been organized in Montreal, under the name of Baxter, Patterson & Co., to handle all kinds of iron and wood-working machinery, engines, fire appliances and engineering and mill supplies. The company have been appointed sole Canadian agents for several large firms in England, Scotland, and on the continent, among them being: Geo. Angus & Co., manufacturers of leather and Balata belting, Newcastle-on-Tyne, England; Walter McFarlane & Co., manufacturers of ornamental castings and soil pipe, Glasgow; Wm. Bain & Co., manufacturers of fencing; and the Cundall Gas Engine Co., England. Special arrangements have also been made with the Nicholson File Co., Port Hope, Ont., whereby the firm will manufacture their highest grade file.

J. R. Baxter is Scotch by birth, but has received an English education in theoretical and practical engineering; and for the past four years he has been in Canada making a special study of conditions here and is well known in business and social life in Montreal. Mr. Baxter will have charge of the practical and selling end of the business.

Wm. Patterson, the other active member of the firm, is also Scotch by birth. He has been connected with the practical side of engineering for the last ten years in Glasgow and Montreal, during which time he has acquired a thorough knowledge of office management. Mr. Patterson will assume the management of the financial end of the business.

The premises of the new firm are at 102 St. Antoine street, Montreal. They have a frontage of 65 feet on that street and 25 feet on Cathedral street. They will have three floors and a basement at their disposal.

* * *

The Steel Output Doubled.

The iron and steel bounty payments paid by the Dominion Government for the financial year up to July 1 amount to $2,004,339, as compared with $1,540,-203 in 1905. The payments indicate a very large increase in the output of the Canadian iron and steel industries.

Bounty amounting to $687,631 was paid on a total output of 581,858 tons og pig iron; of this, 86,523 tons was made from Canadian ore. The bounty on this was at the rate of $1.65, and totalled $142,263; 495,335 tons were made from foreign ore. The bounty on this was at the rate of $1.10, and totalled $544,868.

Last year's output of pig iron was 386,719 tons, of which 327,267 tons were made from foreign and 59,452 from Canadian ore. The rates of bounty were higher, however, last year, viz., $1.50 on foreign and $2.25 on Canadian ore, so the total amount paid as pig iron bounty, was $624,167, of which $490,401 was on foreign and $133,766 on Canadian ore.

Of steel ingots, 569,237 tons were made in the Canadian mills during the past year, as compared with 272,916 tons in 1905 The bounty in 1906 at the rate of $1.65 per ton, was $941,000. In 1905, at the rate of $2.25 per ton, it was $614,433. Of puddled bars, 3,560 tons were made in 1906, as compared with 3,509 tons, the year before. The bounty, at $1.65 per ton, this year, was $5,875. The payments last year at $2.25 per ton were $7,895.

The Government paid a bounty in 1906 of $369,832 on 72,875 tons of rolled angles, wire, rods, plates, etc. In 1905 the payments were $293,208, and the output 59,842 tons.

These iron and steel bounties expire next year unless they are renewed by parliament The bounty rate on pig iron from Canadian ore and on puddled bars and steel ingots this year is $1.05 per ton The rate on pig made from foreign ore is 70 cents a ton.

The lead bounty in 1906 totalled $90,-197, as compared with $330,645 the year before, the rate of bounty being much lower on account of the higher price of lead in the world's markets.

The petroleum bounty, at the rate of 1 1-2 cents per gallon, showed payments amounting to $291,157, as compared with $350,047 in 1905.

There was also paid a bounty amounting to $15,079 in manila used in the manufacture of binder twine, as compared with $13,789. In 1906 the bounty was allowed on 4,423,300 lbs. of manila used in the manufacture of 8,617,457 lbs. of binder twine.

Companies Incorporated

P. J. Powers Co., Limited, Ottawa; capital, $45,000; purpose, to carry on a foundry and machine shop. Directors are: P. J. Powers, M. Lannon, M. Vian and L. Dalpe, all of Ottawa.

The Belmont Mfg. Co., Limited., Montreal; capital, $45,000; purpose, to manufacture and deal in waterproof garments. Directors are: H. Fitzgerald, Geo. Whitfield, A. E. Emblem, all of Montreal.

Canada Quarry & Transportation Co., Limited, Montreal; capital, $20,000; purpose, to operate quarries, sand pits, dredges, etc. Directors are: T. Gauthier, S. R. Gauthier, Montreal, and L. Leger, Lachine.

Hurley Machine Co., Limited, Toronto; capital, $40,000; purpose, to manufacture and deal in all kinds machinery. Directors are. W. Gow, J. S. Lovell, E. W. McNeill, W. F. Ralph, and R. Gowans, all of Toronto.

International Marine Signal Co., Limited, Ottawa; capital, $1,200,000; purpose, to manufacture all kinds of aids to navigation. Directors are: T. J. Willson, Ottawa; H. A. Little, Woodstock; A. M. Scott, Ottawa.

North American Wrecking Co., Limited, Montreal; capital, $60,000; purpose, to carry on the business of wrecking and the performance of salvage services. Directors are: D. Armour, E. F. Surveyor, E. M. McDougall, all of Montreal.

The St. Lawrence & Great Lakes Dredging & Wrecking Co., Limited, Montreal; capital, $350,000; purpose, to manufacture and operate dredging plants. Directors are: J. E. Russell, W. J. McWhinney, E. P. Brown, all of Toronto.

The Quebec, Ontario & Cobalt Silver Mining Co., Limited, Montreal; capital, $1,000,000; purpose, to carry on a general mining business. Directors are: L. J. Labrosse, St. Eugene, Ont.; F. X. Dupuis, Valleyfield, Que., and J. A. Tanguay, Montreal.

The Robert White Co., Limited, Montreal; capital, $250,000 purpose, to manufacture boots and shoes, and to manufacture and bottle mineral waters, etc. Directors are: J. T. Marichal, J. P. Landry, H. E. Moles, C. A. Richardson, all of Montreal.

The Canadian Shuttle Co., Limited, Montreal; capital, $125,000; purpose, to manufacture and deal in shuttles and other mill supplies. Directors are: C. N. Blakeley, H. D. Metcalf, O. B. D'Aoust, Chas. Blakeley, W. S. Hutchinson, all of Montreal.

The Canadian Coal & Navigation Co., Limited, Tillsonburg; capital, $500,000; purpose, to mine, manufacture and deal in coal, coke, etc. Directors are: E. C. Jackson, G. W. Fillson, V. A. Sinclair, E. V. N. Fillson, S. H. Betts and C. H. Denton, all of Tillsonburg.

Iroquois Motor Car Co., Limited, Welland; capital, $96,000; purpose, to manufacture and deal in all kinds of automobiles, motor boats, etc. Directors are: J. F. Mills, Buffalo; D'Arey Scott, Ottawa; A. Griffiths, G. H. Sutherland, J. H. Crow, Welland, Ont.

The Porto Rico Railways Co., Limited, Halifax, N.S.; capital, $3,000,000; purpose, to construct and operate railways in the island of Porto Rico and elsewhere. Directors are: W. N. Tilley, B. H. Parmenter, A. J. Thomson, G. F. Ronald, L. Huffman, E. W. H. Holme, all of Toronto.

The Ontario Oil & Refining Company have been incorporated under Ontario charter with a share capital of $100,000 for the purpose of operating oil wells, gas wells, etc. The provisional directors are C. T. Hobart, G. W. Harrison, T. K. Holmes, J. M. Pike, and James Simon, with head office at Chatham.

The Canadian Steel Construction Company have been incorporated under Ontario charter with a share capital of $50,000 for the purpose of manufacturing and dealing in steel tanks, machinery, engines, etc. The provisional directors are W. J. Lethbridge, D. S. Storey and F. W. Grant, with head offices at Midland.

Benjamin Moore & Co. have been incorporated under Ontario charter with a share capital of $50,000 for the purpose of carrying on the business of paint manufacturers. The provisional directors are H. B. Johnson, J. H. Whitehead, E. W. Wright, C. W. Thompson and Eva Marie Gardiner, with head office at Toronto.

Messrs. N. J. Kerr, A. W. Fraser, R. C. Tate, John Moffat, J. A. Garvin, and W. H. Ostrom, have been incorporated as the Ottawa Sales Co., to deal in inventions, assist people in securing patents and carry on the business of manufacturing or selling any article covered by letters patent. The capital stock is placed at $40,000.

The Peterborough Steel Rolling Mills Co. have been incorporated under Ontario charter with a share capital of $200,000, for the purpose of manufacturing iron and steel and their different products. The provisional directors are Wm. Ferguson, Wm. Rudkins, R. J. Munro, A. Dunn, R. H. Fortye, Daniel O'Connell and A. Elliott, with head office at Peterborough.

P. J. Powers Co. have been incorporated under Dominion charter with a capital stock of $45,000 for the purpose of carrying on a general foundry business and take over the business of Powers & Co. The provisional directors are P. J. Powers, M. Lannon, T. McBrearty, Maxime Vian and Lorenzo Dolpe, with head office at Ottawa.

PERSONAL MENTION.

W. F. Hampton, Canadian representative of Edgar Allen & Son, steel manufacturers, will sail for England on the Empress of Ireland on her next trip.

* * *

Mr. J. De Clercy, M.E., has been in Toronto for some time superintending the installation of a 75 h.p. Dominion gas producer plant in the Chalmers Milling Co.'s mill at East Toronto.

* * *

Mr. P. W. Sothmann, a graduate of the Institute of Technology at Charlottenberg, and a native of Denmark, has been appointed chief engineer of the Hydro-Electric Power Commission. Mr. Sothmann has had considerable experience in various water power and steam power developments in Germany, Russia and South Africa.

* * *

Chas. J. Crowley, C.E., at one time resident engineer of the Grand Trunk Railway, Toronto, has just had the satisfaction of seeing the east bound and west bound shields in one of the 23-foot twin tubes which the Pennsylvania Railway have been driving under the Hudson River, to connect New York and New Jersey, meet. of which work he has been in charge for the last two and a half years.

* * *

Mr. Charles H. Mitchell, C.E., has recently returned from his eight months tour in Europe, where amongst other matters he has been studying the water power and electric installations in Italy, Switzerland and Austria. For four years previously Mr. Mitchell, who is well known in Canadian engineering circles, was chief assistant engineer of the Ontario Power Company at Niagara Falls. Mr. Mitchell will resume his former consulting practice, making a specialty in hydro-electric work and railways, and while still retaining an office at Niagara Falls, Canada, will establish an office also in the Traders Bank building, Toronto, after October 1.

* * *

On his return from his recent western trip, H. J. Fuller, Montreal, president of the Canadian Fairbanks Co., announced that John E. Botterell had been appointed manager of the company's Winnipeg branch, succeeding F. Ross Newman. Mr. Newman has assumed the management of Caverhill, Learmont & Co.'s western business, with headquarters at Winnipeg. Mr. Botterell has been connected with the firm for some time, and for the past few years has been manager of their Vancouver branch. While in Winnipeg Mr. Fuller gave a private dinner at the Royal Alexander, to Messrs. Newman and Botterell, a number of the staff being present.

TO ELECTRICAL ENGINEERS.

ONE of the oldest European electrical manufacturing companies, having five works in different countries, and whose name, exceptional reputation and experience are known throughout the engineering circles of the world, is desirous of appointing representatives in British North America. It is considered that responsible agents with sound technical knowledge and used to big undertakings can undoubtedly handle its leading lines with success, notwithstanding the existing competition from Canadian firms. Applications emanating from well-established engineering firms, having branch offices in the different cities of Canada, will alone be considered. Replies to be addressed to Box 49, CANADIAN MACHINERY, Toronto. [9]

TECHNICAL BOOKS.

BOOKS for Engineers, Mechanics, Draughtsmen, etc. Send address for our latest catalogue of practical, up-to-date works, forwarded post free to any address. Technical Publishing Co., Ltd., 287 Deansgate, Manchester, England. [9]

HAVE you seen our Mechanical and Electrical Pocket Books? They are simply crammed with information invaluable to engineers and others. Many thousands circulated in the States. Price 1s. 2d. and 1s. 8d each post free. Technical Publishing Co., Ltd., 287 Deansgate, Manchester, England. [10]

PROPERTY FOR SALE

FACTORY site or subdividing property; 26 acres or 200 lots; in Industrial St. Catharines; clean, level, dry, square block; inside city; water and rail facilities; electric line passes property; cheap electric power and natural gas; exemptions; best labor conditions; bargain; W. B. Clark, trustee, Port Dalhousie, Ontario. [8]

SITUATIONS VACANT

WANTED — Capable young man with fair knowledge of mechanics, and good appearance as city traveller in Winnipeg. Good position for right man. Box 57 CANADIAN MACHINERY, 511 Union Bank Building, Winnipeg.

WANTED—By new firm, traveler for engine rs' supplies. Good salary to experienced man with good connection. Full particulars from Baxter, Paterson & Co., care of CANADIAN MACHINERY, Montreal. [10]

Here in Canada we talk a lot about

"The Importance of Cheap Power to the Manufacturers"

AND WE SPEND A LOT OF MONEY ON PARLIAMENTARY COMMISSIONS

AND A LOT OF PRINTERS' INK IN NEWSPAPER ARTICLES

AND A LOT OF BREATH IN TALK.

But with few exceptions we have not begun **TO DO** what they have been doing for years in Europe, viz:

USE PRODUCER GAS

AND A GOOD GAS ENGINE

READ LETTER FROM SIMONDS CANADA SAW WORKS

MONTREAL, QUE., July 30th, 1906.

Canadian Agents
of Campbell Gas Engines and Suction Gas Plants.

GENTLEMEN,—

It gives us great pleasure to inform you that the 50-H.P. Campbell Gas Engine and Suction Gas Plant which you supplied us with 6 months ago is operating in a very satisfactory manner.

The fuel costs are only about 90c. per day of 10 hours; this means that we are getting 50 H. P. for 9c. worth of fuel per hour.

The water consumption is insignificant, and altogether the economy of the Plant has been a matter of great surprise to us, and we believe exceeds what you claimed for it when you were negotiating the sale to us.

It is the excellent behaviour of this Engine and Plant and its economy that decided us to place the order with you for the 150 H.P. Engine and 600 H. P. Gas Plant, which you have on the way for us

We also appreciate very fully the prompt attention you have always given to all our enquiries and the manner in which you have helped us over the difficulties we experienced in the installing, owing to the peculiar nature of the ground here, and also in advising us regarding the carrying of the very heavy overload which we have frequently to throw upon the Engine.

Wishing you every success we are, Yours very truly,

SIMONDS CANADA SAW COMPANY, Limited.
B. M. FEENY, Mgr.

This means that this firm are getting power at a fuel cost of

Less than $6.00

per H.P. per annum.

Now What is the use of talking about Niagara Power at **$20** per year when for a moderately small outlay you can get power at a price they cannot touch?

WRITE THE **Producer Gas Co.,** 11 FRONT ST. E., TORONTO

DO IT NOW

Tell Your Story to the Men Who Buy and Influence Buying

—Canadian Machinery is read carefully each month by the proprietor or manager, as well as the mechanical superintendent or foremen in manufacturing plants all over Canada and to them the advertising pages are of direct interest.

—It is the one paper in Canada which furnishes information on everything of interest in the power and machinery field.

—Do you want to interest these men in your product? Then tell your story through the advertising pages of Canadian Machinery.

Let us send you rates

CATALOGUES AND QUOTATIONS ON APPLICATION

Ontario Street, corner Moreau, Montreal

THE POINT IS THIS:

You want to read the best of current literature without having to buy all the magazines and run through hundreds of pages in search of one **GOOD** page.

But there are those who will do this for you at a minimum cost, we do it

The product of our work is:

The Busy Man's Magazine

an epitome of the world's best thought.

If an article with lots of body to it, appears in one of the leading magazines that article will also appear in **THE BUSY MAN'S MAGAZINE.** The same as regards choice bits of humor, vivid sketches of men and events and commentaries on things and conditions of more than passing interest. The contents are varied but all selections are **select.**

Send for Sample Copy

Any subscriber to Canadian Machinery can get The Busy Man's Magazine for **one year** for $1.50.

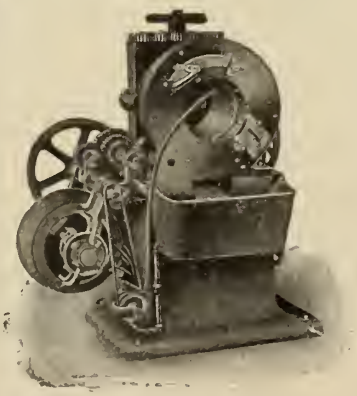
Send in your subscription **now.**

The MacLean Publishing Co., Limited
Toronto

THE CAPACITY FOR WORK

of MERRELL PIPE THREADING AND CUTTING MACHINES—and this combined portable hand and power MERRELL in particular—is unlimited.

Remove the head from the base and use it as a portable hand machine if you wish. It will cut any kind of pipe.



Equipped with our standard quick opening and closing die-heads, improved cutting-off knife and new self-centering vise, this MERRELL will do more work in an easier, quicker and better manner than other machines.

As we make nothing but pipe threading machines we can guarantee each and every part of this machine to do its full share of work and not shirk. That's why we can afford to give it to you FREE for one month's trial.

Isn't this inducement enough?

Will you write to-day?

HAMILTON, - ONTARIO

Wire Soreens for every class of material.

Perforated Metal of Steel, Copper, Brass, Zinc, for all purposes.

Special attention given to miners' requirements.

The B. Greening Wire Co., Limited, HAMILTON, ONT. MONTREAL, QUE.

GRAPHITE PAINTS

It is well known that Graphite makes one of the best paints as a preservative of exposed metal work. It is the best paint to use for iron castings or girders on account of its filling properties thereby giving it a good covering.

MACHINE PAINTS

BESIDES the ordinary, our machine paints are made in paste form and can be used as a filler, applied with a knife or thinned with turpentine and brushed on, spreads freely and leaves a good surface.

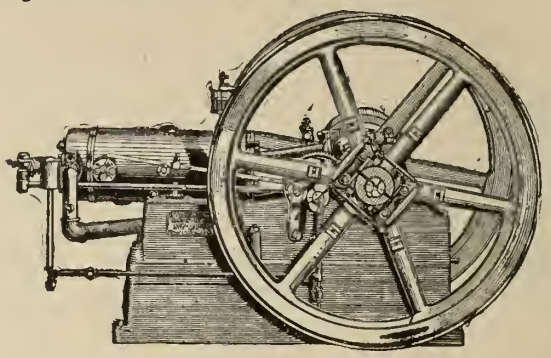
Dependable Power THE KIND YOU NEED



There is no better power available—
No more economical, steady and dependable power—
No power that will increase the capacity and decrease the cost of production so effectually—as that afforded by an

I.H.C. GAS AND GASOLINE ENGINE

Any man of ordinary intelligence can run an I.H.C. gasoline engine without previous experience.
We would like to show you how much more simple they are than any other engines made—how much more easily they are operated and kept in perfect running order and why they develop more power from the same amount of fuel.
We illustrate and explain these points and every other detail in our complete catalogue. Every man who uses power or contemplates installing it ought to get this book.
You will find that the I.H.C line of engines includes just the style and the size best suited to your requirements.
Guaranteed to develop rated horse power.
Adapted to the use of gasoline, gas or denatured alcohol.
I.H.C. engines are made in the following styles and sizes:
Horizontal Engines—
Stationary—4, 6, 8, 10, 12 and 15 H P.
Portable— 6, 8, 10, 12 and 15 H.P.
Vertical—2, 3 and 5 H. P.

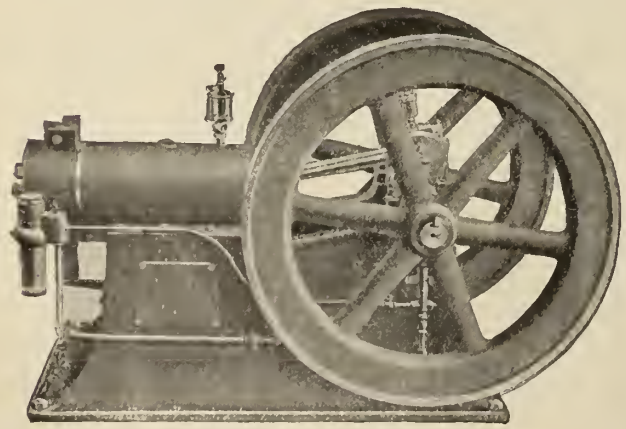
The Famous McVicker



One third the number of parts.

The only four cycle engine that will run either way.

The only improvement in gas engines for forty years.

Governor ten times as sensative as any other. No gears, cams, eccentrics or trigger work of any kind.

The Canadian McVicker Engine Company LIMITED

GALT - - - ONTARIO

Sylvester Gasoline Engines

Are the best that skilled labor can produce.

They are easy starting; they are simple and reliable; they will give full power in the coldest weather. Made in sizes from 4 to 32 horse power in portable snd stationary and from 1½ to 12 horse power in marine. They will run on gasoline, coal oil or distillates.

The SYLVESTER Engine inspires confidence because it is so simple in construction. It is the cheapest engine to buy because there is nothing to get out of order.

The SYLVESTER Engine is handsome in appearance, substantial in construction, marvelous in simplicity, unequalled for effectiveness and durability.

THE HIGHEST AND MOST PERFECT TYPE OF GASOLINE ENGINE BUILT.

If you require to purchase, write for Catalogue and our 1906 Calendar. We will then send our Travelling Salesman to you

ATTENTION TO THE SMALL EXPENSES MEANS **AN INCREASE IN PROFITS**

Is there not a possibility for some saving in your business? For instance, how about the cost of cleaning your castings, etc.?

Investigate. Be sure that this work is being done as well and as economically as it can be. Don't clean your castings by hand methods. Life's too short. Be up-to-date. Use an **"Economy" Steel Wire Wheel Brush.** A great labor-saver. Does the work of five men. For every piece of work you finish by hand methods, your competitor with an **"Economy" Brush** is doing five times as much in the same time, and it's better work, too.

A customer, who has been using "ECONOMY" BRUSHES for the past six years, writes:

Your ***"Economy" Wire Wheel Brushes*** enable us to get CLEANER CASTINGS and a MUCH BETTER FINISH on our goods, and at a LESS COST than by any other method. We have tried other methods and other wheel brushes, but have not found anything from which we can get equal results. ***Hundreds of users of "Economy" Wheel Brushes will tell you the same.***

BOOKS FOR MECHANICS

Hardening, Tempering, Annealing and FORGING OF STEEL.

BY JOSEPH V. WOODWORTH.

Large Octavo. 280 Pages. 200 Illustrations.

Bound in Cloth. PRICE, $2.50

THIS is a new work treating clearly and concisely on modern processes for Heating, Annealing, Forging, Welding, Hardening and Tempering of Steel. It is a book of exceptional value to metal-working mechanics, giving directions for the successful hardening and tempering of all steel tools, including milling cutters, taps, thread dies, reamers (both solid and shell), hollow mills, punches and dies, the various metal-working tools, shear blades, saws, fine cutlery, metal-working and metal-cutting tools, and other implements of steel both large and small. Simple and satisfactory hardening and tempering processes are described.

CONTENTS.

CHAP. I.—Steel; its Selection and Identification; Steel for Various Purposes; The Treatment of Well-known Brands of Steel; the Effects of Heat. CHAP. II.—Annealing Processes; the Terms; Annealing, Hardening and Tempering Defined; the Annealing of Malleable Castings. CHAP. III.—The Heating and Cooling of Steel; Location of Heating Arrangements; the Use of Gas Blast Furnaces and Heating Machines; Tough Steel and Hard Steel; the Difference. CHAP. IV.—The Hardening of Steel; Hardening in Water, Brine, Oil and Solutions; Special Processes for Special Steel. CHAP. V.—Tempering; by Colors; in Oil; on Hot Plates; by Thermometer; in Hot Water; in the Sand Bath; by Special Methods. CHAP. VI.—Case Hardening Processes; the Use of Machinery Steel for Cutting Tools and the Treatment of It. CHAP. VII.—Hardening and Tempering Milling Cutters and Similar Tools. CHAP. VIII.—Hardening, Tempering and Straightening all Kinds of Small Tools. CHAP. IX.—The Hardening and Tempering of Dies and all Kinds of Press Tools for the Working of Sheet Metal. CHAP. X.—Forging and Welding. CHAP. XI.—Miscellaneous Kinks; Processes and Methods of Annealing, Hardening, Tempering, Forging and Welding in the Working of Different Kinds of Steel and Iron; Tables for Use in Metal Working. CHAP. XII.—Grinding.

NO MECHANIC

can afford not to have in his room a small library of books pertaining to his trade.

The studying of such books as we offer will increase the earning power of the workman.

SHOP KINKS

BY ROBERT GRIMSHAW.

Containing 400 Pages and 222 Illustrations. Handsomely Bound in Cloth. PRICE $2.50.

THIS book isn't like any other book on the subject, but shows special ways of doing work better, quicker, and cheaper than usual. It is full of pointers as to how work is done in the best American and European shops. It bristles with valuable wrinkles and helpful suggestions. It will benefit all, from apprentice to proprietor. Every machinist, at any age, should study its pages.

CONTENTS.

Lathe Speed; Lead Screw; Grinding Lathe Centers and Spindles; Cut-off Centers; Tube Centers; Centers Right and Wrong; Testing Centers; Alignment of Centers; Setting Lathes; Backing off Cutters; Bell Chucks; Spring Chucks; Drivers and Dogs; Milling Vise; Steady Rests; Tool Clamps; Tool Holders; Gauges; Center Drilling; Combination Drill and Counter Sink; Center Reamer; Centering Devices; Chasing; Chilled Roll Turning; Curve Boring; Turret Lathe Tools; Special Tool Holder; Fluting Reamers; Squaring Up Connecting Rods; Turning Vulcanized Fibre; Turning and Key eating Shafting; Counter Balancing Cranks; Slide Rest; Making Reamers; Step Reamer; Standard and Adjustable Reamers; Planers; Quick Return, Open Side and Holding Work; Planer Chucks; Hollow Planing and Large Work; Planer Parallels and Gage Blocks; Cutting Gears on Planer and Slotter; Boring Cylinders and Large Holes. Boring Bars; Work on the Drill Press; Clamping Jig and Clamps; Starting and Centering Drills; Drilling Hard Steel; Drilling Glass; Splicing Drills Long Drills; Twist Drills; Drill Speed; Drilling in Water Pipes, Drilling Square Holes; Cutting Teeth in Large Quadrants; Milling Cutters, Solid and Sectional; Gang Milling Cutters, Speed of Milling Cutters; Emery Wheels and their Work; Grinding Gages; Grinding Rolls and Balls; Metal Saws and Cold Sawing; Punches, Centering and Spiral Taps; Plain and Collapsing; Frictionless Taps; Dies and Screw Cutting; Bending Copper Pipes; Riveting; Calking Tools and their Use; Surface Plates; Surface Gage; Beam Calipers; Measuring Screw Threads; Gaging Worm Threads; Broaching; Keys; Solid, Split, Taper; Cutters; Set Screws; Jigs and Special Tools; Files, etc., etc.

BOOKS FOR MANUFACTURERS

PATTERN MAKING

By JOSEPH G. HORNER, A.M.I., M.E.

Author of "Toothed Gearing," "Plating and Boiler Making," etc.

OCTAVO. 486 ILLUSTRATIONS. 372 PAGES

PRICE, $3.00

This is a practical treatise, embracing the main types of engineering construction, and including gearing, engine work, sheaves and pulleys, pipes and columns, screws, machine parts, pumps and cocks, the moulding of patterns in loam and green-sand, estimating the weight of castings, etc.

Being a well-written technical guide, written by a man who understands and has practiced what he has written about. We cordially recommend it to engineering students, young journeymen, and others desirous of being initiated into the mysteries of pattern-making.

CONTAINING SPECIAL CHAPTERS ON

Tools used in pattern-making, designing toothed wheels, spur gearing, bevel-wheels, worms and worm-wheels, machine-molded wheels, mortise-wheels, helical wheels, Angle or twist wheels, core prints, engine cylinders, engine cylinders struck in loam, engine beds and base-plates in general, flywheels, strap pulleys, metal patterns, miscellaneous engine-work, sheave-wheels, columns and pipes, miscellaneous pipe-work, fluted and ornamental columns, estimating weights of castings from their patterns, use of cores and drawbacks, loam patterns. Specialties, special tools, chain barrels, chilled work, screws, foundry requisites, heavy machine work, lathe matters, pumps, cocks and valves, water-wheels and turbines, boiler fittings and mountings, workshop notes, pattern shop machinery, qualifications of a pattern-maker, patterns for plate moulding, storage of patterns, appendix.

NO MANUFACTURER

who is desirous of increasing the efficiency of his staff and improving the output of his factory will be without a Technical Library

We supply books on every subject.

Gas, Gasoline and Oil ENGINES.

BY GARDNER D. HISCOX, M. E.

413 Pages. 312 Illustrations and Diagrams.

Handsomely Bound in Cloth. Large Octavo.

PRICE, $2.50

Every user of a gas engine needs this book. Simple, instructive and right up-to-date. The only complete American work on this important subject. Tells all about the running and management of gas engines. Full of general information about the new and popular motive power, its economy and ease of management. Also chapters on horseless vehicles, electric lighting, marine propulsion, etc.

SPECIAL CHAPTERS ON

Theory of the Gas and Gasoline Engine; Utilization of Heat and Efficiency in Gas Engines; Heat Efficiencies; Retarded Combustion and Wall-Cooling; Causes of Loss and Inefficiency in Explosive Motors, Economy of the Gas Engine for Electric Lighting; The Material of Power in Explosive Engines; Gas, Petroleum Products, and Acetylene Gas, Alcohol; Carburetters, Atomizers and Vapor Gas for Explosive Motors; Cylinder Capacity and Dimensions of Gas and Gasoline Engines; Mufflers on Gas Engines; Governors and Valve Gear; Ignitors and Exploders, Hot Tube, Electric, Jump Spark; Hammer Spark, Induction Coil and Dynamo; Cylinder Lubrication; On the Management and Running of Explosive Motors; Pointers on Explosive Motors, The Measurement of Power by Prony Brakes, Dynamometers and Indicators, Speed Measure; Explosive Engine Testing; Types of the Explosive Motors; Various Types of Stationary Engines, Marine and Vehicle Motors; United States Patents on Gas, Gasoline and Oil Engines, and their Adjuncts, 1875 to date.

TO OBTAIN MORE POWER.

QUEBEC RAILWAY LIGHT & POWER CO. DAM MONTMORENCY.

A Huge Reservoir Created Half a Mile Above the Falls for Storage Purposes—Contract Awarded for a Hydro-electric Plant.

Quebec, Aug. 12.—The Quebec Railway Light & Power Company, finding that its power from Montmorency Falls proves inadequate at certain times, has entered on an extensive development about half a mile higher up the river. To provide for the season of low water the company has erected there, according to the plans of Mr. E. A. Evans, chief engineer and general manager, a dam 84 feet high, the highest in Canada, for such a purpose. It is 67 feet 4 inches wide at the base and 12 feet wide at the crest and will hold back 52,000,000 cubic feet of water.

The contract for the plant to develop this power has been awarded to Allis-Chalmers-Bullock, Limited, Montreal, the only firm in Canada who build both the electrical and the mechanical portions of a hydro-electric development. It will consist of a 1,500 K.W. alternating current generator, driven by a 2,125 h.p. turbine water wheel. Both generator and turbine will be built in the shops of this firm in Montreal. The plant is fully expected to be in operation by December 1, 1906.

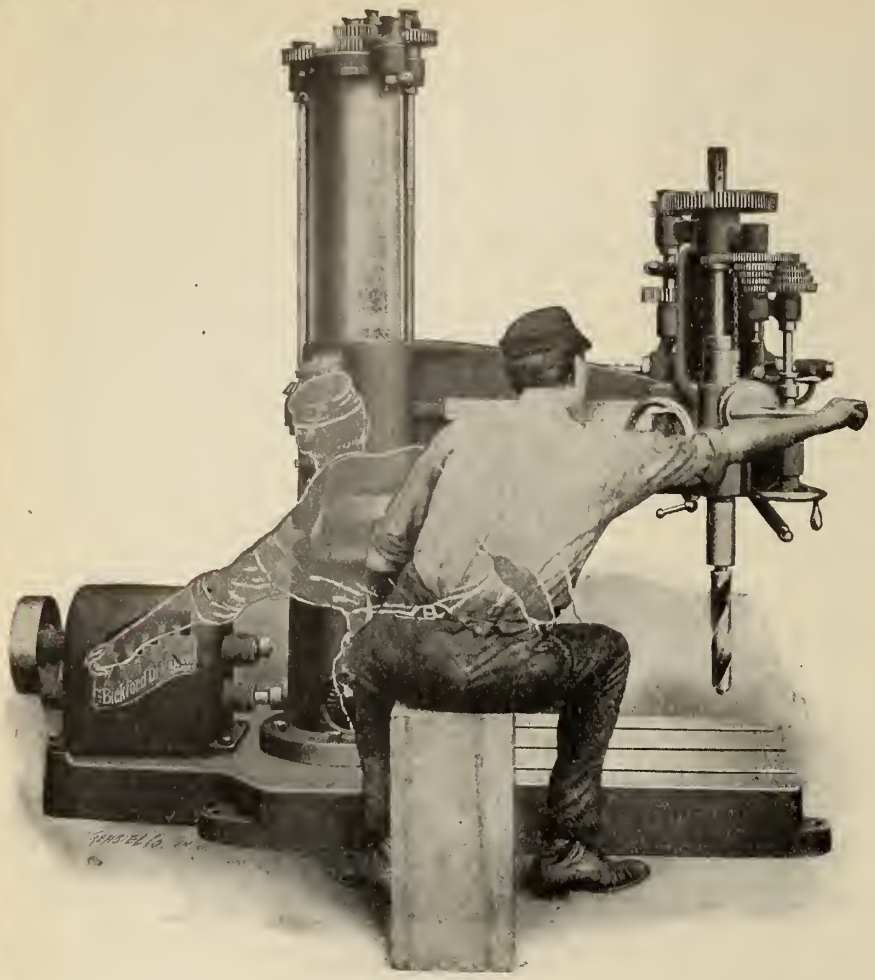
MANUFACTURERS KEMPSMITH MILLING MACHINE

Wilmarth & Mormon Co., Grand Rapids, Mich.
MANUFACTURERS OF YANKEE DRILL GRINDER

The London Machine Tool Company at their new plant in Hamilton are prepared to do the best and most exacting work in the line of Machine Tools, and earnestly solicit your enquiries and eventual orders.



The Lever You Want Right At Your Finger-Tips

Stop running "round to the back of your machine for a lever that you use from 1 to 20 times a day.

Everything Within Easy Reach of the Operator

This is what we claim for this new 30" **BICKFORD RADIAL**—in fact for all our Radials. And we can prove it, too, not by argument or glib assertion, but by actual demonstration. Look at the cut—did you ever see a handier, neater or more stockily built Radial in your life?

And it's just the thing for taking care of the ordinary work as found in the average shop—it was built for that purpose, you know.

Then, again, we want you to put in the little Radial in place of the large Upright you were thinking of buying. It doesn't cost much more, has infinitely greater productive capacity and will out-last and out-drill any Upright ever built.

It's made in three lengths of arms, remember, 30", 36", and 42".

Circulur 1-A. Shall we send it?

ARTICLE XX.—Indestructible Brick Limited, Toronto.

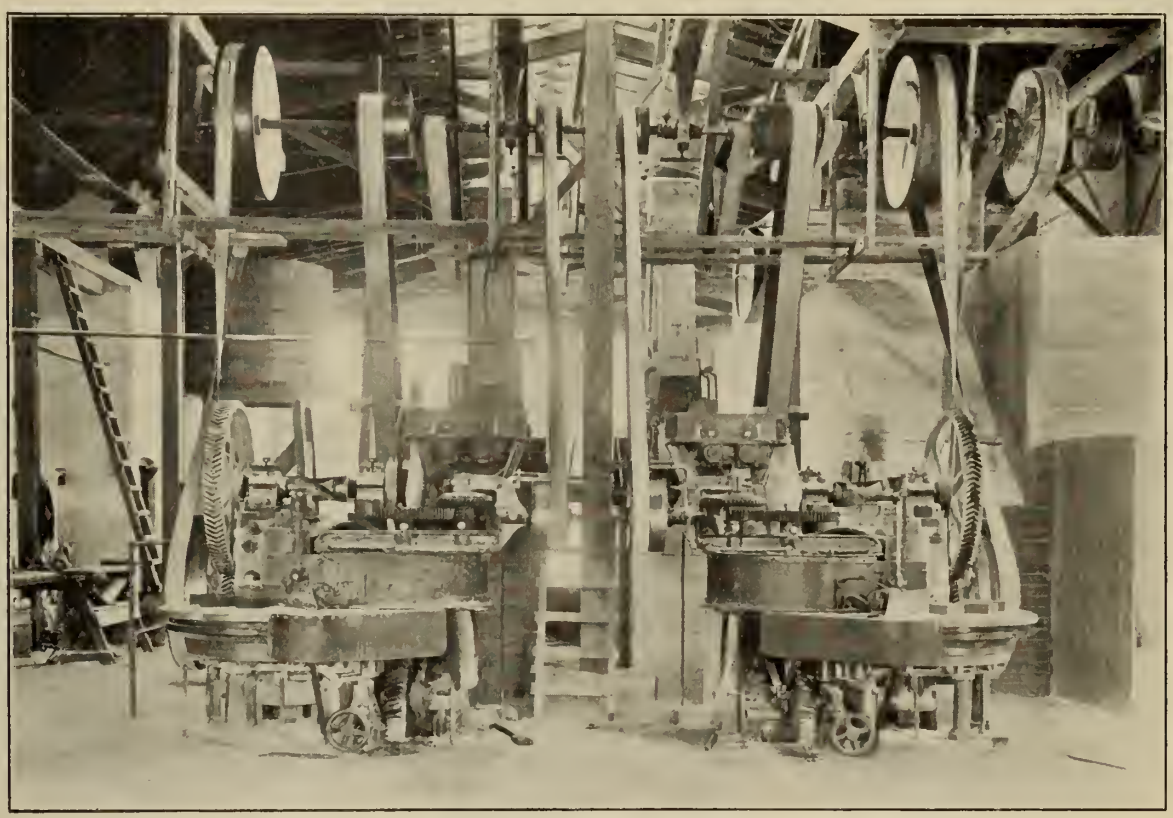
Reviving a Lost Art.

FOR centuries it has been known that artificial stone had been made by the ancients from sand and lime, but the method of accomplishing their purpose in this direction had been considered as lost. The cisterns of Salamo, near Pyrus, and other hydraulic works of that kind consist of this kind of artificial stone. In the ruins of Salamo Temple, near Jerusalem, well preserved remains of artificial sand lime masonry are found, and particularly noticeable are four colossal courses of this masonry in the ruins, which are made of the same material. During the thousands of years that have passed by since these were built, the artificial sand stone has become harder and firmer, while old buildings of burnt brick and harder natural stone have long since succumbed to the influence of weather and have fallen to pieces.

The United States Daily Consular Report of October 3, 1903, gives some information on the subject of making bricks from lime. It is here stated that the first experiments in making bricks from sand and lime appear to have been undertaken at Potsdam over thirty years ago. They were suggested by the fact that Potsdam, like many other places in Central Germany, is surrounded by a wide, sandy plain, which furnishes neither clay for brick nor stone for building purposes. The calcareous bricks were first hardened by exposure to the air, a tedious process which required several months, although the bricks hardened in that way seem to have stood all tests and continue to harden with increasing age.

F. Commick, in Germany, perfected the process of combining sand with hydrated lime and hardening it in steel cylinders under steam pressure. This gave the Germans of this district a cheap building material and one better in every respect than any other for their purpose.

The German Government, always most particular as regards all structural materials, gave sand stone bricks the most exacting test over a period of about five years before they would permit of their general use, and at last placed their stamp of approval on them. Since then the German Government has been one of the chief users of this brick in connection with hydraulic works, dams, military barracks, fortifications, palaces, public buildings and railway stations. In one building erected by the German Government for one of its departments 22,000,000 sandstone brick were used.



Indestructible Brick Limited—Kommick Sandstone Brick Presses. Capacity Each 21,000 Brick Per Day.

Extensive plants were erected in that country, followed by others throughout the continent and in Great Britain. In 1903 the first plants were introduced into the United States and it is only recently that the subject has been taken up with vigor in Canada.

Brick Plant.

On January 9, 1906, Indestructible Brick, Limited, with F. B. Allen, president, W. Del Wilson, vice-president, and Thos. Smith, secretary-treasurer, broke

ground at Swansea for a plant to make sandstone brick. In April the plant was working to a capacity of 21,000 bricks per day. The company's property at Swansea comprises thirty acres of sand, which is probably the best for making sandstone brick of any yet found in Canada.

The demand for these bricks was found to be so great that the company were compelled to add an extra hardening cylinder to their plant. Before operating two months a further addition was made by the installation of another press. In September a further increase of another hardening cylinder was made, which is as the plant stands at present.

Plant of Indestructible Brick Limited, Swansea, Ont.

The handsome brick building as shown in the illustration, made from the company's brick, is 95 by 123 feet and contains a complete outfit for the manufacture of about 50,000 brick a day. The power plant consists of a 100 h.p. Corliss engine, 125 h.p. Inglis boiler, a Moffatt feed water heater and pump. A neat electric lighting plant has also been installed, consisting of a Sturtevant high speed vertical engine, direct connected to generator. Arc lights are used for lighting.

The brick-making machinery consists of four hardening cylinders, each having a capacity of 11,000 brick. A Grand Trunk siding runs to the plant and a complete industrial railway system has been incorporated in the buildings and to the yard. A press is also available for the manufacture of shape brick, enabling the company to keep on hand a complete stock of shape, demanded by architects in all the standard colors.

Chemistry of Sandstone Brick.

The chemistry of sandstone brick is simple. Start with limestone, which is calcium carbonate, burn it in a kiln and burn off carbonic acid, leaving calcium oxide or quick-lime. Mix it with water to slack, which forms calcium hydrate or slacked lime.

The sand and calcium hydrate are mixed and subjected to steam heat and pressure of 120-lbs., which converts the silicic oxide (sand) and calcium hydrate into hydro-calcium-silicate, an entirely separate chemical compound from sandstone or quick lime. This is a chemical union of silico and lime and is a much more indestructible substance than either natural sandstone or limestone.

Making Sandstone Brick.

About twelve hours are required in the making of the sandstone brick. Of this one quarter hour covers the journey of the sand from the ground through the mixer and press, from which it is delivered a finished brick in all except hardness. From the press it goes into the hardening kettle, where it is submitted to a live steam pressure of about 120 lbs. to the square inch continuously for eight to ten hours. At the end of that period an hour is required to cool, that the brick may be handled. They are now complete and ready for the mason, and are hard, strong brick, becoming harder and harder each day for several weeks until their maximum hardness is obtained. In this they resemble natural sandstone, which, as is well known, grows harder with continued exposure to the air. The sandstone may be laid in the wall at once without waiting for its maximum hardness to be obtained. The proportion of sand to lime is about five to one.

The Brick Press.

Aside from the chemical features such as perfect hydration of lime before being pressed into the brick, the most important feature of the sandstone brick industry is the presses and mechanical accessories necessary for the formation of the brick. The apparent simplicity of the operation has lead a great many into the belief that any kind of a press will make sandstone brick. After a course of failures in both Europe and the United States, and some in Canada, it has been learned that only machinery especially designed for the purpose can be made a commercial success. Owing to the difference in nature between dry sand and plastic clay as regards their abrasional qualities, it follows that to withstand the extreme cutting of sand under high pressure specially designed machinery must be used. The press used in this instance is a Kommick rotary sandstone brick press, manufactured by the Kommick System Sandstone Brick Machinery Co., of Toronto, recently incorporated, who own the Kommick patents for Canada.

Indestructible Brick Limited—Steel Steaming Tanks, Capacity Each 14,000 Brick.

Some of the points advanced in favor of sandstone brick are that it improves with age. It has great crushing strength, is low in porosity, has no scaling, but slight heat conductivity, is unaffected by acid, is absolutely sanitary. Further there is no disintegration from extreme climatic changes, and practically no expansion from heat. An economy in laying is effected on account of the uniformity of size, shape, and color, and the faculty with which bricks can be cut. It is claimed to be the only brick with which a two sided finish 9-inch wall can be built.

When starting, this plant some of the bricks were taken to the Toronto School of Science. Here they were tested for crushing strength and showed a resistance of 2,997 lbs. per square inch. City Architect McCallum of Toronto tested the brick to ascertain the suitability for large buildings for Toronto, submitting them to a freezing and fire test. As a result he sanctioned their use for all occasions where bricks are required.

With the Civil Engineers to Victoria.

A Brief Summary of a Three Weeks' Trip, Being the Annual Outing of the Canadian Society of Civil Engineers.

EVERY year the council of the Canadian Society of Civil Engineers plan an educative trip to some point of special engineering interest. This year the usual conservatism of the engineer was set aside in the proposing, planning and successful carrying out of an excursion that for distance, duration of time, and permanent value far exceeded that of any previous occasion. Great credit is due Professor C. H. McLeod, secretary of the society, who, assisted by Dr. J. B. Porter, was responsible for the ideal arrangement of all the many details connected with the trip, the concensus of opinion being that they were complete in every particular. The part the Canadian Pacific Railway played in the outing is greatly to its credit, the officials displaying not only a generous spirit but showing a recognition of the importance of the C.S.C.E. in the development of this great Canada of ours. Free haulage was supplied for a special train consisting of three Pullmans, the "Bathurst," "Trianon" and "Chantilly," and diner, which were at the disposal of the party throughout the trip, except in the lake district of British Columbia. The equipment was superb and the attendance the best possible. Perfect arrangements, perfect weather and, as one of the ladies expressed it, "a perfectly delightful crowd," were features combining to make the outing one of real enjoyment.

John Greey, of W. & J. G. Greey, Toronto Note the Straw Hat, Buffalo Coat and John's Smile.

Prof. C. H. McLeod and Dr. Porter, who Engineered the Trip.

It is possible here to take barely a glance at the experiences of the excursionists, as they hurried across the prairies, at that time yielding their millions of bushels of grain, or as they followed the winding steel trail through the matchless Rockies or sailed across to the beautiful Victoria, or at one time climbed mountain peaks into the very clouds and at another descended hundreds of feet into the earth. Imagination could not picture a wider variation of scene or situation. Whether on board the train admiring the glorious scenery or visiting some feature of engineering interest, or being entertained by an appreciative municipality or company the civil engineers and friends were enjoying the trip with intense delight.

On Sept. 8th a special train pulled out from Windsor street station, Montreal, being joined at North Bay the same evening by a Pullman from Toronto and Western Ontario coterie. The personnel of the party was made up of:—

Prof. Owens in Hunting Attire at Calgary. Next day many a Black Duck was Missed from his Usual Haunts.

At Winnipeg the first stop was made on Monday, Sept. 10th, where the party were guests to luncheon of Mayor Sharp and Aldermen at Silver Heights, being of the nature of a civic entertainment. In the evening a garden party was given by Col. and Mrs. Ruttan at their home in honor of the guests. At Calgary a visit was made to the Irrigation Works, where one of the most extensive irrigation projects on the continent is under way. Chief Engineer Dennis provided a luncheon at the engineer's camp which was heartily enjoyed after the long drive. The journey was continued the same afternoon, continuing through the foot hills into the

mountains stopping at Banff at 7 p.m. Until 3 p.m. the next afternoon the wonders and beauties of this marvellous district was enjoyed. Laggan from which Lake Louise is reached was the next stop, followed in turn by several hours at Glacier where the entire party climbed to the field of perpetual ice. Exactly a week from leaving Windsor station, Montreal the special train drew into Vancouver. Here after visits had been made the plant of the Pacific Coast Pipe Co., where wood stave pipe is manufactured and to some of the large saw mills, a trip was made by special steamer to the power plant of of the Vancouver Power Co., where an economical and highly up-to-date insallation supplies electric energy for Vancouver. This was followed by a trip to Victoria where a committee showed the party the beauties of the place, by means of both carriages and motor boats. From Victoria trips were made by some of the party to Nanaimo and Esquimalt. Leaving Vancouver on Tuesday, Sept. 18th, an addition to the party was made at Revelstoke when Mr. C. B. Smith, in his private car Wanaganni, and ladies joined the party.

The Lake Trip.

At Arrowhead the special train was left behind and the entire party embarked on the steamer Rossland for a sail down the Arrow Lakes. From West Robson the party journeyed by train to Nelson. Here a launch party including a visit to a fruit ranch showing some of the wonderful possibilities of this district, followed by a visit to Nelson Fair were features. At Bonnington Falls the new power house of the West Kootenay Power & Light Co. was visited, and a luncheon given by the officers of the West Kootenay Power & Light Co. enjoyed.

Mining Country.

To go into detail as to the many interesting features of the mining country would take many pages. At Rossland the LeRoi, Centre Star and War Eagle mines were inspected by different divisions of the party. From an engineering view point, for its size Trail offered as much of interest as any other place. Here the plant of the Consolidated Mining & Smelting Co., of Canada, is situated. Besides smelting the copper ore from various mines around lead ore is smelted and the pure lead deposited by the Betts process, electrolitically, and from the slag pure gold anatomy and silver are recovered. A different style of mining to that carried on at Rossland was seen at the wonderful Granby mine at Phoenix, where 2800 tons of ore from a solid mountain of this material are obtained every day. At Greenwood further mining and smelting experiences were obtained. The mine operators and citizens were lavish in their entertainment which ended with a high class banquet.

When in this district Grand Forks was headquarters for two days, and before leaving the Granby smelter was gone through, and the method of smelting the copper ore contrasted with that of Trail and Greenwood. It is impossible in a few sentences to do justice to the wonders of this British Columbia mining country as seen by the civil engineers.

Returning Home.

Returning to Nelson the return trip was commenced by boat through the Kootenay Lake where the special train having gone around by Calgary was waiting to carry the crowd on the eastern journey. A number of stops were made in the Crows Nest Pass district and at Michel an opportunity was given of going into one of the extensive coal mines. A couple of hours were spent at Frank viewing the scene of desolation ocassioned by the landslide of two years ago. A few stops were made from the Rockies to Winnipeg where it was proposed to spend an afternoon and evening but owing to the lateness of the train the afternoon trip was impossible.

As a lively finish to a strenuous trip the engineers of Fort William and Port Arthur combined to entertain the party which was done in a royal manner. On the afternoon of Sept. 27th, a large tug was chartered by means of which a splendid opportunity was given of viewing the elevators and coal and ore loading facilities to be found there. In the evening a reception was given at the City Hall where nearly all the party young and old alike danced the hours away until close to the time for departure. At North Bay the Toronto car and Mr. Smith's were detached, the major portion of the excursionists arriving in Montreal on Saturday, the others going to Toronto and on to their various homes.

As mentioned in starting it has been possible to merely mention the events of the trip giving no detail whatever but it is hoped in later issues to give some accounts of various manufacturing and engineering features encountered on the way.

THE USE OF CLAY CONES IN STEEL HEATING.

THE days of estimating the heat of a work-piece by the color have gone by — at least in establishments were any weight is laid on uniformity of product. In the first place, no two men will agree as to the color of a piece in any one fire or bath; and in the second, the same temperature will be differently estimated in different parts of the shop or at different times of the year—or even day; and in the third place (what is of equal importance), no two steels will show the same color for the same temperature. Something more exact must take the place of the eye. There are some good pyrometers, but they are generally expensive and delicate, and inconvenient to apply. But there is a means of measuring—not estimating—temperature, which manufacturers of fine porcelain use, which should be of great value to steel workers in enabling them to ascertain with certainty just what the temperature in a furnace really is, instead of guessing at it. And here we may add what we should have given as fourthly above—that the eye grows tired and less sensitive to color; so that the same temperature will be estimated lower, after ten minutes' watching red or white hot metal or combustible.

The method to which we refer consists in the use of porcelain—or rather clay—cones of various melting or softening points; there are about sixty different grades, each stamped with a number corresponding to a definite temperature at which slumping down takes place. The range of temperature is between 590 degrees and 1,940 degrees C., or say 1,094 to 3,524 degrees F.

In order to find out which cones to use, where the right temperature is not known in degrees, the first test is made with several cones, and that one is chosen as the standard which at the desired temperature curls over and nearly or quite touches the floor of the furnace. It is best to use two cones of the proper number, one for the hottest and the other for the coolest part of the furnace; their curling over is to be watched through the usual peep-holes, preferably covered with mica. The cones should be protected from direct flame, just as much as the work-pieces are. A good way is to fence them around with two bricks on the side and one on top, the cone also standing on a brick. Another way is to use open-sided clayware hoods provided for the purpose, and which melt at a higher point than any of the cones. There are also small muffles which serve the same purpose, as well as capsules with lids; these latter, of course, must be drawn from the furnace in order to observe the cones.—Scientific American.

CANADIAN MACHINERY
and Manufacturing News

A monthly newspaper devoted to machinery and manufacturing interests-mechanical and electrical trades, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

OCTOBER'S METAL FEATURES.

CONSUMERS of almost every kind of commercial metals are finding an increasing difficulty in obtaining supplies, and prices are in many cases higher than the oldest metal men have ever known them before. The month of October has been remarkable for the all around strength shown on the metal markets, and from all appearances the end of the boom has not yet come.

Sensational advances have been made by lead and copper. At the end of September lead began to make gradual strides upward on foreign markets. For some time Canadian prices did not follow suit, but the situation was so firm that prophesies of 5-cent lead were freely made. These predictions would have seemed ridiculous a few months ago, but the fact remains that the price of lead to-day is well above the five-cent mark. There have been temporary breaks from this figure within the past week or so, but it seems reasonably certain that the short supply of and brisk demand for the metal will keep prices almost stationary for some time to come. At time of writing quotations are the highest on record.

For many years copper has not been so high as it is to-day. That a scarcity existed has been known for a considerable time, but the producing interests seemed anxious that prices should be maintained on a reasonable level, so that deliveries were carefully distributed and the advance delayed. The inevitable has happened, however, and prices are soaring higher almost every day in both sheets and ingots.

Founders and other users of pig iron have had many disappointments during October. A scarcity has developed all over the world, and furnaces everywhere have booked their output for months ahead. Canadian importers have felt the effects of the stringency, and have been assailed with telegraph and letter requests to ship immediately. Several well known brands were absolutely off the Montreal market some weeks ago, and it is stated that even those consumers who have hitherto stuck religiously to their favorite brands will undoubtedly have to accept mixtures during the coming Winter. The Canadian steel companies are themselves taking practically the whole output of their furnaces, and the independent producers have been hard pressed to supply orders. It is understood that the Deseronto Iron Co. have recently given up the manufacture of charcoal iron.

Sheet metals as a whole are quite as firm as ingots, and during the month advances have been made in sheet lead, copper and zinc, while importers generally raised galvanized sheets at the beginning of the month. Black sheets are also higher in some gauges. If the present situation continues much longer, finished materials will have to advance materially to permit of a profit in the manufacture.

SOME MUNICIPALITIES OPPORTUNITY.

A LARGE manufacturing firm in the United States who have been making high-grade metal-working machinery for the past forty years, are desirous of opening and operating a plant in Canada. They inform us that if any municipality has a suitable manufacturing plant in the right location, with a foundry attached, or if any town has a good building for manufacturing and a foundry already established, they would take the matter up at once and come to a decision very quickly.

This is a desirable proposition for some municipality. Any manufacturer or board of trade interested will be put in direct communication with the firm in question by letting us know in detail what they have to offer.

MOTOR PARTS WANTED.

EVIDENTLY the manufacturers of motor parts in France are unable to supply the demand and are looking to Canada for help to enable them to fill their orders. The following letter from the British Chamber of Commerce at Paris, to the editor of Canadian Machinery, explains the situation there :

Dear Sir,—Please accept my thanks for copy of your excellent journal, which, I feel sure, will interest importers here. I have already, in fact, an inquiry from one of the members of our chamber, who desires to know whether any Canadian manufacturers of motor car parts are open to do export trade to France. If you can put this inquiry in the way of any of your advertisers so that they may communicate with this office, I shall be much obliged.

Thanking you in anticipation,

Yours faithfully,

(Signed), J. B. MEADOW-SMITH,

Secretary.

Enquiries sent to the different automobile manufacturers in this country have brought out the fact that there is no possibility of the wants of French manufacturers being supplied in Canada in the immediate future. Only one firm in this country make these parts and it is hardly able to supply the demands of the firm's output without seeking foreign trade. This seems to offer a good avenue for an enterprising manufacturer in this country.

NEW MACHINERY HALL ASSURED.

CONSIDERABLE interest was evinced in the opinions of various manufacturers and of the decided stand taken by Canadian Machinery in our September and October numbers on the question of a new Machinery Hall for the Canadian National Exhibition. Opinions expressed were unanimous in favor of a new building to properly exhibit the high-class machinery manufactured in this country. The need was a crying one as the consensus of opinion has indicated. Manufacturers may now take a more cheerful view regarding the future in this connection, as we have been assured by Dr. Orr, manager of the Exhibition, that a new Machinery Hall is proposed for the near future.

In his official report not yet published, Dr. Orr has urged upon the authorities to take steps in this direction, quoting the opinion of Canadian Machinery and of our friends who have favored us with their idea in the matter. When the new land east of the present grounds has been secured it is proposed to move the stables to the easterly portion of the grounds, leaving a large area available for a Machinery Hall along modern lines. It will be necessary to have it adjoining a railway track that a siding may be run directly into the building. This, with traveling cranes, will give manufacturers a chance to unload their machinery and place it on the space allotted at a minimum cost and with minimum wear and tear on the various parts. The matter will, however, have to go through the hands of the city council, and even if it is decided at the earliest possible moment to go ahead with this building it would be impossible to have it for the coming Exhibition, but it is fully hoped and expected that the succeeding one will find a new Machinery Hall equipped and ready and of ample size to fulfill all requirements. This is a matter of sincere congratulation on the part of the various manufacturers of metal, wood-working and other machinery and power plants. It means that they can only exhibit their high-class product to advantage but also as is the case in the Process Building, they can show an admiring public the various processes carried on by the different machines manufactured.

In view of the disastrous and unfortunate burning of several of the Exhibition buildings on the night of October 18, the immediate prospect of a new Machinery Hall has received somewhat of a setback. We are assured by Dr. Orr, however, that the original intention is to be maintained, and as soon as the burned buildings have been replaced, and proper provision to meet its construction, the new Machinery Hall will be a reality.

MACHINE SHOP ECONOMICS.

REPAIR machine shops cannot be classed, as far as economy goes, with the shop of a manufacturing plant. The reasons are many. The entire work of a manufacturing shop can be arranged with more or less precision. For the most part each tool can be devoted to a certain class of work, and thus the work can be all pre-arranged. In the equipping of the manufacturing shop one has a more or less accurate knowledge of the tool requirements, and with good management no unnecessary tools need be installed. Practically speaking, if the plant is running under full capacity no tool need be standing idle, and each can have work for which it is best adapted. This cannot be done in a repair shop. There the work is intermittent and varied, and the shop must be equipped for emergency cases as well as for ordinary work. In a repair shop there will be at one time a rush of work, whereas at another time things will be very slack ; and in consequence there will be times when some of the mechanics will have very little work to do. As a result of these conditions the mechanics will often times regulate their working speed to suit the amount of work before them, working slowly when there is very little ahead and working quickly when there is a rush. Thus there is necessarily a slackness with regard to the methods of work regulation in these shops, and there is in consequence a tendency to conduct things generally on slack principles. This should be guarded against. In shops of this kind economy in power is very often lost sight of, because in other things economy is not a consideration. In a repair shop economy in power can as well be considered as in a manufacturing shop, and because economy cannot be practiced generally it should be given special consideration where possible. Economy in power is a factor to which it would pay the superintendent of a repair shop to give special consideration.

NEW FIELD FOR GAS ENGINES.

NOW that the success of the gas engine is assured for automobiles, motor boats and manufacturing, another field is being exploited which, if successful, opens a wider sphere of usefulness for internal combustion engines, being its adaptation to self-propelled cars for suburban traffic. The cars now under test by different companies are run by motors and electrically controlled as has heretofore been the case, being as it were a power house on wheels, the initial power being supplied by gasoline engines. No figures as to the relative economy of this method are yet available. Should they near approach what has been prophesied for them they are bound to become a factor for suburban and interurban traffic for both freight and passenger service.

Tricks of the Trade

Everybody is invited to contribute to this page. Send in your ideas, odd jobs you are doing, and anything of interest to fellow-workmen. Remuneration will be made for such contributions. [Ed.]

SAVING OIL IN THE ENGINE ROOM.

"TIME is money," because time has a money equivalent, and by the same rule oil is money, because it also has a money equivalent or cash value. Now a perfectly logical deduction would be: that to save oil is to save money, and because the saving of money is a live topic I am going to say something about saving its equivalent—oil.

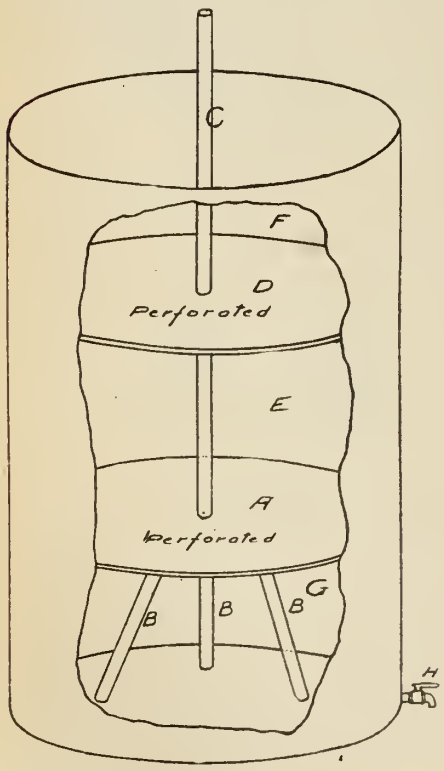

Fig. 3

The great majority of the readers of Canadian Machinery are sure to be engine owners, therefore I am encouraged to hope that this little article may be read with at least some interest by some one.

The power engine in the plant of which I have charge is a 14x36 Corliss

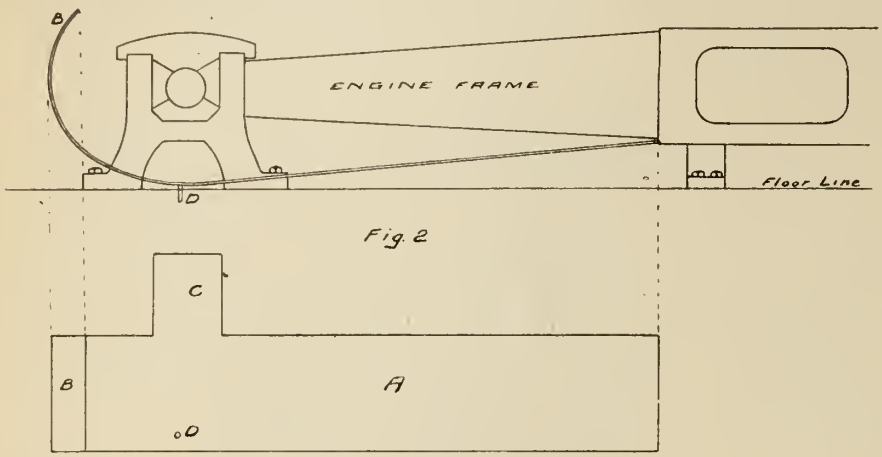

Fig. 2

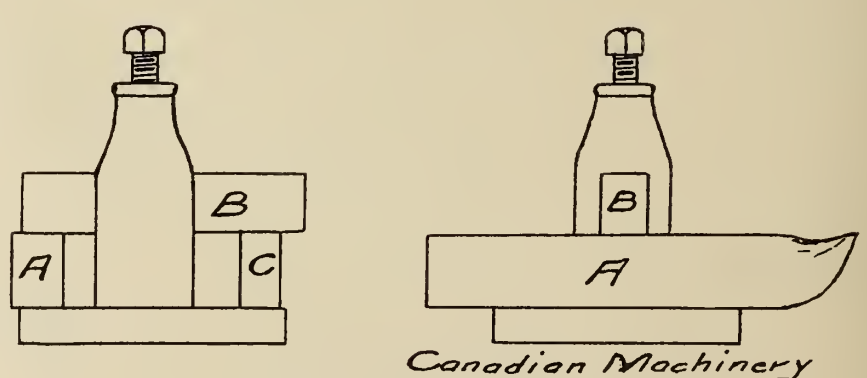
Fig. 1

of the girder-frame pattern (the pattern most common in Canada). For a long time, like nearly all the other engines of her pattern, she flung her oil on the floor, up against the wall, or any old place that seemed to suit her (I was going to say taste, but tastelessness would be more truthful) till one day the idea got into my head that I could harness Niagara—I mean the oil shower. Fig. 1 shows the idea as I had it reproduced in galvanized iron, and Fig. 2 shows it as applied to the engine. The dotted lines connect the same part in the two figures. Fig. 1 is a large oil pan ½ in. deep and made something like a toboggan with a projection on the side of it. (A) is the main body and runs from the outer end of the lower guide, slanting down to the floor at the main bearing. (B) is the end curved upwards to a circle somewhat larger than the sweep of the crank, and (c) is a projection of the pan that extends through underneath the arch of the main bearing and out far enough to catch the drip from the eccentric. By this arrangement I catch all the oil from both guides, the cross-head pin, the crank pin, the main bearing and the eccentric. Now that very nearly includes the whole engine. The oil all runs to the lowest spot in the pan, which is at the hole (D), and then passes down the pipe (D) into a pail that I keep hung underneath the floor and to which I have access by a small trap-door, which I had cut for the purpose.

Now in this oil there is bound to be more or less dirt, so to make it fit for use I rigged up the simple filter shown in Fig. 3. It consists of a 5 gallon can with the top cut off, into which I fitted the wooden piston (A), with three legs on it, (BBB), making a sort of three-legged stool. This piston or disc I bored full of holes, and into the central hole I screwed the pipe (C). Then I made a second piston (D), same as (A), only without legs, and with the central pole made large enough to allow it to slide up and down on the pipe (C).

The space (E) I then packed neatly, about 6 in. deep, with cotton waste. I pour the oil into the space (F) and it filters through the waste into the space (G), from which I draw it by the tap (H). The use of the pipe (C) is to let the air out of the space (G) as the oil comes in, and to let air into the space (G) when oil is drawn off.

If it were necessary I would—and have—used this filtered oil a second time on my engine, but having a lot of shafting to oil out in the shop I pass it on to the oilers and save just that much new oil. The result is that I oil my engine for practically nothing.—R. Manly Orr.



Substitute for Off Set Cutting Off Tool.

SUBSTITUTE FOR OFF-SET TOOL.

A GOOD substitute for an off-set cutting off tool, for threading up close to chuck, is by using a straight tool clamped on tool post washer by means of a square steel bar as square as tool post slot is wide. I think sketch will explain. (A) is tool, (B) is bar through slot, (C) is block. I have found it very handy for cutting off even with chuck jaws.—Jas. Moore.

RESTORING PERISHED RUBBER.

RUBBER is used by the machinist mostly for solid springs, for washers and derigable pipes. For such purposes elasticity is the main essential. But rubber in its various manufactured states looses its elastic properties by age and exposure. This "perished" rubber can be at least partly restored by soaking in "ammonia fortor." And by the same expedient the perishing of old rubber goods can be long delayed.

The chemistry of the action is not very clear in its detail, but it is probably in the nature of a deoxidizing agent for the rubber, and also a regenerator for the carbonates so largely used as "fillers." It is a fact that manufactured rubber is a "mysterious" produet—in its was as deceitful as soap." Rubber itself is of different kinds derived from several different trees and vines. Besides these inferior grades various gums, also products derived from boiled oil and its homologues are used as adulterants, and liberal fillers of tale, chalk and the like are added. All pure rubber is very susceptable to sulphur, promptly going to a stieky mess. It is in this way that the evil smelling bi-sulphide of carbon acts to make rubber cements, but a common sulphur match will, if left in contact with a rubber band, get there just the same, and with less advertisement by smell.

Although rubber is used so extensively for washers, it is but a very poor substitute for leather, for under pressnre rubber flows as ice does, only much more readily, and also the mechanical mixture of the powder used as filler washes out.—C. J. Stuart.

SOLDERING ALUMINUM.

THE most satisfactory alloy for soldering aluminum consists of 1 part aluminum, 1 part phosphor tin, 11 parts zinc, and 29 parts of tin. To avoid loss of the more easily volatile of these metals the aluminum is melted first, then the zinc in small pieces, and the tin in small pieces, and lastly the phosphor tin. For soldering no acid is used, but the surfaces to be joined are fresh scraped and covered with a thin coat of the solder in the usual way, then brought together and sweated with the soldering copper, a blow pipe or a torch, while pressure is applied as the solder softens to make the joint.

The aluminum must be heated to about 660 deg. F. before it can be soldered.—From Iron Age.

This method is considered satisfactory for making Aluminum patterns in more or less constant use. For instrument work it is usual to nickel-plate the parts to be joined, and use silver solder, which makes a job as nearly lasting as can be.

The usual trouble with aluminum soldering schemes is two-fold. A thin glace of oxide of aluminum forms readily on exposed surfaces of the metal, and is difficult to remove with a flux, and is not affected by most acids in cleaning, hence the resort to fresh scrapped surfaces. Second, when the solders are in place and holding, the several layers of aluminum and alloys of zinc, and zinc and tin, readily forms an electric couple, especially with changes of temperature, as one consequent of the currents resulting we have electrolysis of the alloys, with the inevitable weakening at the joint. The nickel plating resists and protects the silver alloy, while the presence of phosphorus even in a small percentage tends to check the formation of an electric couple.—C. J. Stuart.

Combination Foundry Ladle

By John D. Adams

THE accompanying drawings illustrate a very convenient form of Foundry Ladle of 2-ton capacity. The design is such that the ladle can be used as an ordinary guard crane ladle or placed in its truck and used on a suitable track system about the foundry. The ladle is held in position on the truck by means of two pins $1\frac{1}{4}$ inches diameter by 4 inches long, welded on the lower ends of the vertical bars which support the ladle. These two pins fit into holes drilled in the top of the vertical standards of the truck. Arranged in this manner, the ladle can be run up on the track in front of the cupola and filled; after which it may be lifted from its supporting standards by a travelling or jib crane and poured by means of the worm gearing attached thereto. If the Cupola is within reaching distance of the crane, the ladle may be swung by the crane onto a pair of vertical stationary standards in front of the cupola and used as a "Catch" Ladle.

Truck.

It is hardly necessary to give any description of these standards or of the truck as local conditions, such as gauge of track, etc., will govern the design. In fig. 2 the standards are gray iron castings of angle section, which are bolted to the sides of the truck which are also of cast iron. If there are no sharp turns in the track system and a long wheel hose can be used, it will be possible to set the ladle lower, because the axles can then be placed outside of the standards as shown in Fig 1.

Ladle Gearing.

The ladle proper is provided with the worm and worm wheel form of gearing, which is the most commonly used form of gearing for crane ladles of moderate capacity. Pouring is controlled by a hand wheel shown on the right hand side. This operates a pair of bevel gears having a ratio 2 to 1, which in turn operate the worm and worm wheel, which is keyed directly on to one of the trunions of the ladle. For one quarter turn of the ladle on its trunions, eighteen turns of the hand wheel are necessary.

The number and size of the teeth in the gearing are as follows:—Bevels 12 and 21 teeth, $\frac{3}{4}$ inch circular pitch; worm wheel 36 teeth, $1\frac{1}{4}$ inch pitch; worm single thread $1\frac{1}{4}$ inch pitch; pitch diameter of bevels, 5.73 and 2.86 inches; pitch diameter of worm wheel 11.32, and minimum outside diameter, 15.12 inches; pitch diameter of worm, 3.58 inches; outside diameter, $4\frac{3}{8}$ inches; total depth of teeth, .858 inch; width of space at bottom of worm teeth, .387 inch; angle of worm teeth, 29 deg. In this ladle all gearing had ordinary cast teeth and was all fitted up

complete before attaching to the vertical support of the ladle.

Bowl.

The bowl was designed to carry 4000 pounds after allowing 1½ inches for lining on the sides, 2 inches on the bottom and 3 inches on top for slop. The dimensions of the bowl taken inside are as follows:—Diameter at top, 31½ inches; diameter at bottom, 28½ inches; depth 30 inches. Two plates of ¼ inch tank steel, 32 x 53 inches, were used to cut the two side pieces from and a circular disc 5-16x32½ inches was used to flange the bottom from. Side seams are lapped and single inverted with ⅝ inch rivets 2½ inch centres. Care should be taken to countersink the rivets below the centre line, so as to permit of the hand with its trunions being slid on to the bowl. The girth seam is single inverted with ⅝ inch rivets, 1¾ inch vent holes in the bottom before riveting up the bowl.

Forgings.

A bar of iron 4x¾ inch should be bent on edge to the extent of about 6 inches, so that when it is rolled to the diameter of the bowl, it will conform to its taper. After the band is welded into a continuous ring, the trunions are forged on. These should be of 2½ inch round iron, which is afterwards turned to 2 5-16 inches. The uprights are of 3x¾ inch iron, which should be welded to 3x1 inch iron for the bearings of the trunions, to allow for forging and boxing out. The ends of the trunions should be boxed with a one inch drill for several inches to receive the steadying bars. Dimensions of loop and cross bars are as shown in Fig. 1.

To counterbalance the weight of the gearing, the ladle should be provided with a cast iron weight swung on the opposite trunnion. The weight of the ladle proper complete is about 1075 pounds.

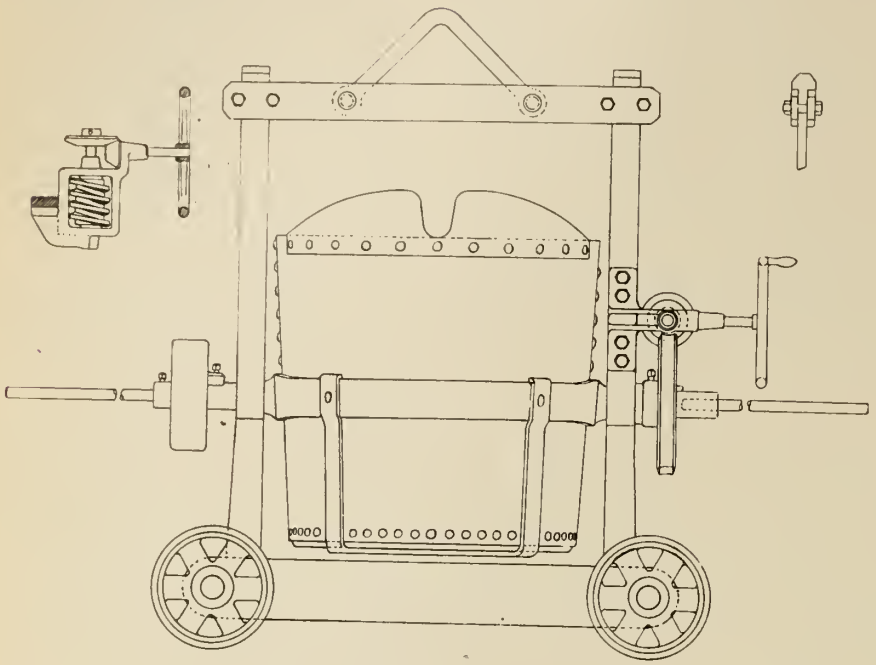


FIG. 1.

FRICTION AND LUBRICATION.

SOME interesting and valuable experiments, conducted some years ago by R. Tower for a research committee of the Institution of Mechanical Engineers, of Great Britain, but which have not been widely published, are described here by Professor G. F. Charnock. The work was carried out with a belt-driven shaft of steel, provided with a journal four inches in diameter and six inches long. Upon the upper side of the journal was fitted a gun-metal step, the arc of contact being rather less than half the circumference. Various means of lubrication were provided, the last being a bath of oil. The results of the experiments were that the friction is nearly constant under all loads, within ordinary limits, and it does not increase in direct proportion to the load, according to the ordinary laws of friction. The coefficient of friction with bath lubrication varies inversely as the pressure; or, in other words, the friction of the bearing is altogether independent of the pressure upon it. This is provided the pressure does not exceed 400 to 600 pounds per square inch. The coefficient of friction is inversely proportional to the temperature. The friction increases with the velocity apparently nearly as the 1.5 power. The coefficient of friction varies with the lubrication used, and was found by Tower to be least for olive oil and lard oil. Sperm oil comes next, followed by mineral oil and mineral grease.—Mechanical Engineer.

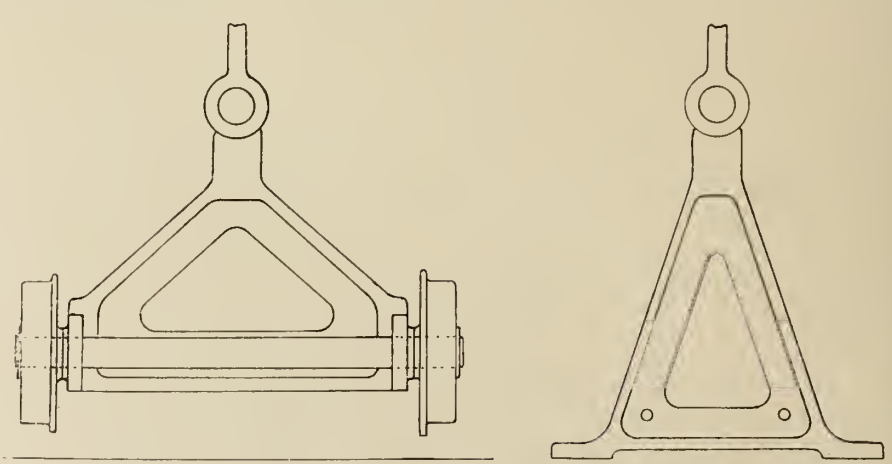

FIG. 2.

The manufacture of tantalum, one of the hardest metals known, into sheets and bars is now, it is said, being practised in Germany by the squirting process, the material in its original powdered form being mixed with water and gum tragacanth, and then successfully forced into rods and shapes as desired.

Never whip your brain. All high pressure is dangerous. Study to think as quietly and as easily as you breathe. Never force yourself to learn what you have no talent for. Knowledge without love will remain a lifeless manufacture, not a living growth.—Professor Blackie.

Platinum has been discovered at many points in Canada—in the sands of the North Saskatchewan River in Alberta; in British Columbia; in the Cariboo region; in the copper sulphide of the Yale district; in the copper nickel ores of Sudbury, Ontario; and on the south bank of the St. Lawrence River, in the Eastern Townships of Quebec. Hitherto, however, Canada's contribution to the world's supply has been insignificant.

Practical Questions and Answers

Indicator Spring.

Ques.—What is meant when the springs used in steam engine indicators are spoken of as being number 60, number 80 or some other number ?

Ans.—These numbers signify the scale of the spring. That is, in the case of a 60 spring, it requires 60 pounds pressure to raise the indicator piston against the spring so that the indicator point will rise one inch on the card. Then to find the mean effective pressure in pounds per square inch from a diagram made by a 60 spring one must multiply the average height of the diagram in inches by 60. A 60 spring forms a very convenient diagram for an engine using steam at 100 pounds pressure, and that one is usually made use of. For a gas engine an 80 spring is more convenient.

Refrigerating and Ice Making.

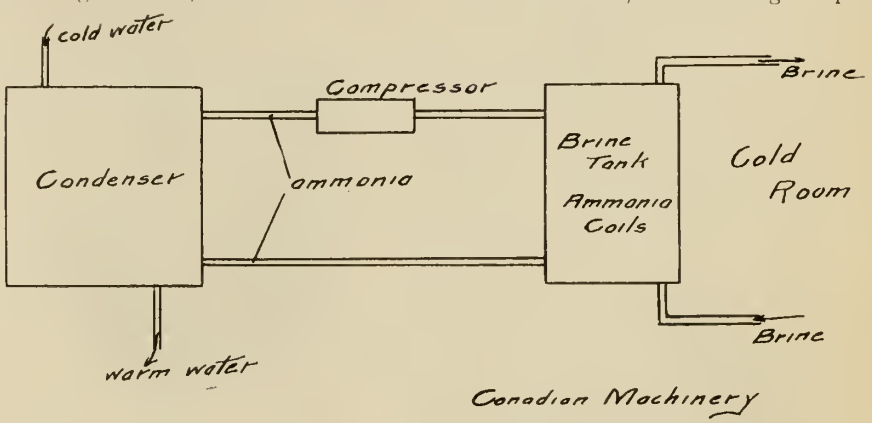
Ques.—I would like to know if it is possible to manufacture ice for home use. How is a refrigerating plant made, or how is ice manufactured ? Some information on this subject will greatly oblige.—Jas. C. Moore.

Ans.—Yes, artificial ice is made very extensively where it is cheaper to manufacture than to import it. The ice is made by artificially lowering the temperature around water to such an extent that the water freezes. The theory of the operation of refrigerating machinery for thus lowering the temperature is as follows : A gas or vapor is compressed by some external force, and then relieved of its heat so as to diminish its volume. This compressed gas is then caused to expand, during which operation the temperature is lowered. The commonest liquids available for use in refrigerating machines are ammonia, sulphur dioxide, ether, carbonic acid and brine. The compressor forms the chief piece of mechanism about a refrigerating plant. Ammonia is the liquid most commonly used for this purpose. The operation of an ammonia compression refrigerating machine is shown in the accompanying diagram. In this illustration are shown diagramatically the chief features of a refrigerating plant, including the cold room, the brine tank and coils through which the brine is circulated, the compressor and the ammonia coils, and the condenser where water is circulated to cool the ammonia. The operation of the plant is as follows : The ammonia is compressed and in passing through the coils in the condenser is cooled. In the brine tank the ammonia is allowed to expand suddenly, during which it absorbs heat from the brine, until the brine falls below the freezing temperature of water. Thus we have a means of freezing water.

There are two methods of ice making, one the "plate" system and the other the "can" system. In the "plate" system the ice gradually forms in from eight to ten days in hollow plates, usually about 10x14 feet in area and fourteen inches thick, the cooling liquid flowing through the plate which is cored for that purpose. In the "can" system the ice is formed in blocks weighing about 300 pounds and requires about 48 hours in the forming. The investment required for the "plate" system is about one-third greater than it is for the "can" system.

Shrinkage in Castings.

Ques.—What is the shrinkage allowance necessary in the making of patterns for castings in iron, brass and steel.



Ans.—The amount of shrinkage depends almost as much upon the style and size of the casting as upon the metal, and in making patterns the style of the casting is always taken into account. The quality of the metal, and the manner of molding and cooling will also have a decided effect upon the amount of the shrinkage. However, for castings where the thickness runs about one inch the following allowances can be made, on good authority : For cast iron, $\frac{1}{8}$ inch per foot ; for brass, 3-16 inch per foot ; and for steel, $\frac{1}{4}$ inch per foot. Thicker castings under the same conditions will shrink less than that indicated, and thinner ones more. The allowance to be made under the various conditions that may arise in order that close work may be done is a matter of experience.

Loss of Metal in Cupolas.

Ques.—What is the percentage loss of metal in melting in cupolas ?

Ans.—From experiments made, it might be said that the loss is between 5 and 6 per cent.

To Start a Suction Gas Plant.

Ques.—Can you supply me with information as to how a suction gas producing plant is started up ?

Ans.—A fire is started in the producer with wood or waste, the small fan, either hand or power as the case may be, being used to blow up the fire, before which it should be seen that the cock on the escape pipe is open to the atmosphere?. Water is then turned on to the vaporizer until it overflows through the pipe provided for that purpose. Water is also turned into the scrubber in order that that may be ready for use when required. More fuel is added to the producer so as to fill it, as soon as the wood or waste fire has caught well. Then the fire is blown for about fifteen minutes, after which time the escape cock is closed, and the gas passes through the scrubber, etc. Now before starting the engine the gas should be tested, and for this purpose there is usually a test cock provided between the scrubber or final sawdust cleaner, if there be one, and the engine. After the gas has been blown through this cock for about five minutes, to insure that there is no air left in the apparatus, a match can be applied to the test cock. The gas will probably burn with a blue flame at first, but as the blowing proceeds the flame will turn an orange color which latter color is an indication that good producer gas is being obtained. After this the test cock can be closed and the engine started.

Of course this operation has only to be gone through when the producer plant is first being started or after it has been cleaned. When closing down for the night all that is required is that the producer be closed up, and the fire left banked. Then in the morning the fire can be blown up, the gas tested and the engine started in a very short time.

PERSONAL MENTION

New Branch Manager.

AN interesting development in the history of Schuchardt & Schutte, manufacturers of machinery, machine tools and specialties, who now have offices and factories in all the principal countries of the world, was reached last week, when they opened a Canadian branch with offices at 13 St. John street, Montreal, in charge of J. Sophus, whose likeness is here presented.

Mr. Sophus is now a thorough-going and enthusiastic Canadian, but he was born in Denmark, twenty-five years ago. His early education was received in that country, but, while still a mere youth he went to England, where he gained valuable business experience for six years. During this time he traveled in Holland, Germany, France and Sweden.

Abont a year and a half ago, Mr. Sophus decided to try his fortune in Canada and entering into partnership with W. B. McLean, under the firm name of McLean & Sophus, carried on the business of mechanical engineers and machinery experts. This firm held the Canadian agency for Schuchardt & Schutte. When the partnership was dissolved, recently, Mr. Sophus retained his connection with them. It was only last week, however, that final arrangements were made, by which Schuchardt & Schutte opened their branch here, and

J. SOPHUS, Montreal,
Manager Canadian Branch Schuchardt & Schutte.

Mr. Sophus was made their Canadian manager.

A full line of Swedish cutlery will be introduced into Canada by this firm next year, but in the meantime they are prepared to push the sales of their "Vesta" cream separator, Gronkvist drill chuck, split steel pulleys and a complete line of shelf hardware.

Mr. Sophus is an enthusiastic and enterprising young man of the type who succeed, and Schuchardt & Shutte have made no mistake in entrusting to him their Canadian business.

Geo. Gurry, retiring general superintendent of the Locomotive & Machine Co., Montreal, was, on Oct. 15th, tendered a banquet at the Windsor, by the heads of departments, foremen and assistants of the works. Mr. Gurry, who has been superintendent for nearly three years, is now leaving to act as general superintendent of the American Locomotive Co.'s plant at that place.

* * *

Mr. C. B. Smith, chairman of the Temiskaming & Northern Ontario Railway Commission, has retired in order to take charge of Winnipeg's municipal hydraulic power scheme. His salary for this will be $5,000 a year. Mr. Smith will retain his connection with the Rail-

J. R. BAXTER,
of Baxter, Paterson & Co., Manufacturers' Agents, Montreal.

way Commission, as consulting engineer, and will continue a member of the Hydro-Electric Power Commission. His salary as chairman was $3,500.

GASOLINE ENGINE PROGRESS.

A NEW company with headquarters at Toronto, known as the British Canadian Engineering Co., with a capital of $250,000, has been established by Mr. John Robson, A.M. I.M.E., of England, to further the gasoline engine trade of this country. Mr. Robson has associated with him J. Mills Wilkinson, vice-president of the Amalgamated Oil Co., and M. J. Miller, of Toronto. They have taken over the business of the Miller Reversible Gasoline Engine Co., and are sole Canadian agents for Pollock, Whyte & Waddell, of Glasgow, manufacturers of the Globe gas and oil engine, and Blackstone & Co., Stamford, England, manufacturers of oil engines. They will also represent one American firm, the Springfield Gas Engine Co., of Springfield, Ohio. This firm will no doubt add considerable impetus to the gas engine trade in this country.

I have grown to believe that the one thing worth aiming at is simplicity of heart and life; that one's relations with others should be direct and not diplomatic; that power leaves a bitter taste in the mouth; that meanness, and hardness, and coldness are the unforgivable sins; that conventionality is the mother of dreariness; that pleasure exists not in virtue of material conditions, but in the joyful heart; that the world is a very interesting and beautiful place, and that congenial labor is the secret o happiness.—A. C. Benson.

Mechanical Reviews

OPINIONS AND STUDIES WORTH NOTING

INSTALLING A STORAGE BATTERY AND BOOSTER.

AT a plant where I was employed a new storage battery of 68 100-ampere cells was required. The battery was selected and the makers contracted to furnish and install the entire equipment, including the battery, a shunt-wound booster set, the switchboard and all cables and wiring. The work was done by experienced men, but the troubles encountered were entirely out of proportion to the size of the job; some of these may be of interest.

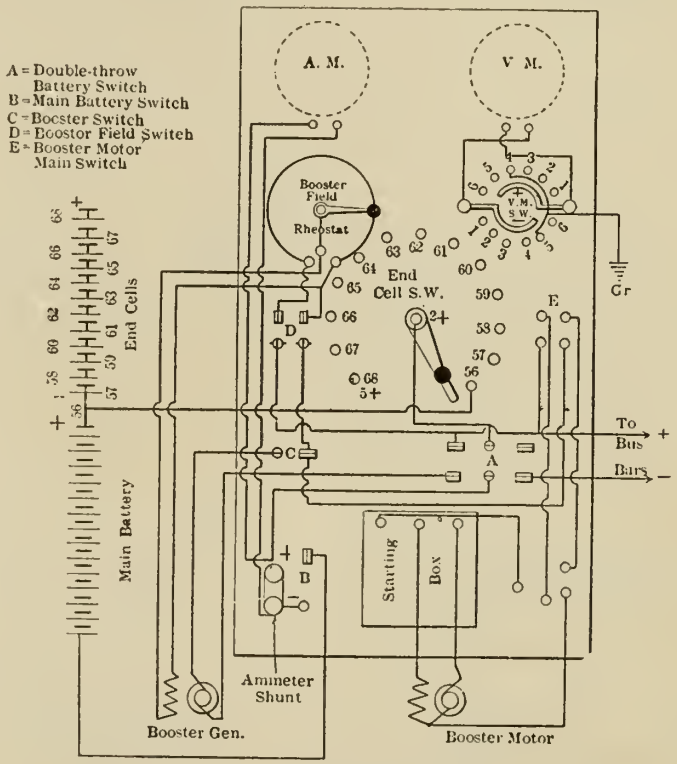
The accompanying diagram shows all the connections of the installation. After the connections were completed they were tested out and declared to be all right, but when an attempt was made to start the booster set, the motor had so little starting torque that it was necessary to give it a pull by hand before it would move; and at other times the starting box would be smoking before the motor was up to speed, and if the resistance was cut out a little too fast the circuit-breaker would come out.

After the booster was up to speed it was found to oppose the electromotive force which it was supposed to boost. This difficulty was remedied by reversing the field connections of the booster, but the motor remained a puzzle. I had an idea as to the cause of the trouble, and when an opportunity presented itself I took a portable voltmeter and proceeded to test the accuracy of my guess. It was a very simple matter to try the voltage of both field and armature with the starting-box handle in several positions, and, as I expected, the voltages of the two circuits were the same for each position of the starting-box arm; this proved that the field circuit was through the starting-box. This diagram indicates that one of the field leads is connected to the starting-box and the field current passes through the coils of the magnet which holds the starting-box arm in the running position. An examination of the starting-box showed that a mistake had been made in the connections, and a few minutes' work put an end to the trouble with the motor.

The next trouble was with the rehostat, which got smoking hot after the machine had been running a short time. The machine was left in my care soon after it was started, and I reported the action of the rheostat, but they concluded it was only the paint choking a little, and let it go on until it was ruined. The plans showed the booster to be excited from the bus-bars and the rheostat to be connected as shown in the accompanying diagram; it will be seen that this is not the usual connection. It is known as a shunting rheostat, the object of this connection being to obtain a finer adjustment of the field voltage than is possible with the usual series rheostat. The rheostat in question had only two binding posts, so it was connected directly in series with the field winding. All things considered, it appeared as if the builders of the machine had made a blunder and wound the field magnet for self-excitation, which proved to be the case, and as the bus-bar voltage was 115, and that of the booster only 50 volts at full load, it was not surprising that the rheostat gave out.

An attempt was then made to operate the booster self exciting, but it was not successful. When starting the charge, the battery voltage and the bus-bar voltage were nearly equal, which permitted not over ten volts on the booster at the time of throwing the battery switch to the charging position, and as soon as the switch was thrown in, the booster would frequently unbuild, and sometimes reverse the field before the switch could be pulled out. It acted so very unsatisfactorily that the experiment was given up in disgust, and the proper field coils and a new rheostat were ordered.

While waiting for these to arrive, we took two rheostats which happened to be available, connected them in series, and managed to pull through. When the new coils and rheostat arrived the coils were changed, but the rheostat was the usual two-connection one, having a resistance of 250 ohms. The matter was again referred to the builders, and after some time, a third binding post was finally sent with directions for connecting it, and no further trouble was experienced in this direction.



BATTERY AND BOOSTER CONNECTIONS.

The battery tanks were made of glass, and as originally set up were placed on stringers with a glass insulator under each corner of each tank, and with lead washers between the insulators and the tanks. The tanks were a source of continual annoyance and expense by breaking, until they were all changed on to sand trays in the usual manner, after which they held all right. —Power.

PROBLEMS IN GEARING.

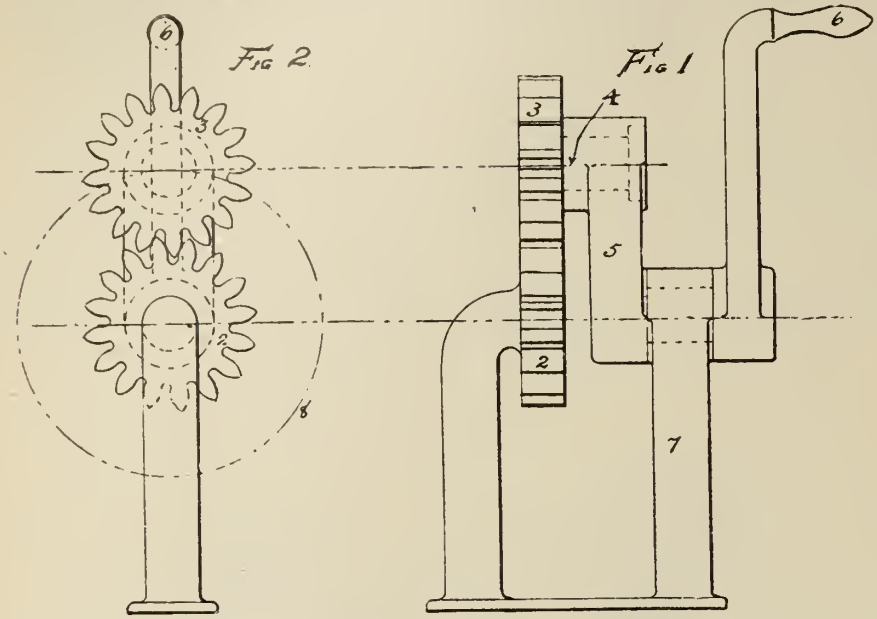
SOME years ago, while designing a machine, I ran up against an interesting problem in wheel gearing, one that every young draftsman should work out and give a place in his notebook. Its solution not only is interesting, but a knowledge of it may save trouble, in my case it almost got to the shop before the error in speed calculation was noticed, and owing to the peculiar construction of the machine it would have been quite costly to have made the necessary changes after the machine was built, as sometimes is done; to say nothing about the cheap feeling a fellow would experience if the thing did not work right. In Figs. 1 and 2.2 is a small gear rigidly secured to the support 1. 3 is a gear having the same number of teeth as the gear 1. 5 is a crank mounted to rotate in the support 7, and is for carrying the gear 3 through the path 8. The problem is by turning the handle 6 one revolution, how many revolutions will the gear 3 make about its axis 4?

Now having satisfied yourself in regards the above, try the following:

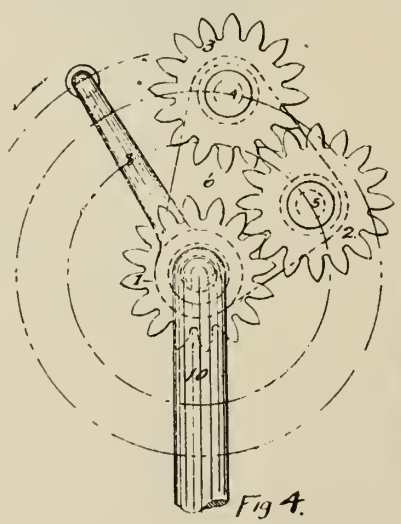
In figures 3 and 4, 1 is a gear rigidly secured to the support 10. 6 is a carrier rotatively mounted in the upright 9. 2 is a gear fitted to rotate on the pin 5 carried by the piece 6, and driven by the gear 1. 3 is a gear fitted to rotate on the pin 4 carried by the piece 6, and driven by the gear 2. Question.—If the gears 1, 2, 3 have the same number of teeth, how many turns will the gear 3 make about its axis if the crank 8 is turned one revolution? Another one. What difference, if any, would it make if the gear 3 should be placed further from the gear 1, that is say that the centres of the three gears were in a straight line instead of forming a triangle as shown?—Browning's Industrial.

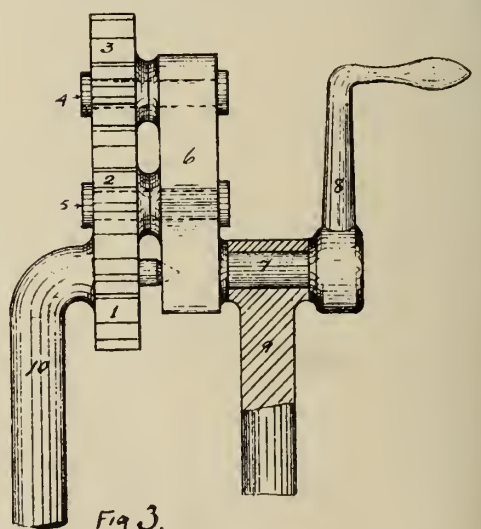
PROJECTION OF WOOD SHAPER CUTTERS.

A PAINFUL and what might have been a serious accident, and the discussion arising therefrom, prompts the writer to contribute this article for the benefit of those engaged in this line of work and others who use machines in which the cutters are fastened to heads which revolve, as do almost all wood-cutting heads.



The accident referred to was one in which the work called for cutters which project a considerable distance out of the slot—in other words, beyond the head—in which position the distance out, added to the high speed and size of cut, created a leverage that made the cutters lose their hold, fly out and inflict a painful wound to the operator's arm. This brought about a discussion in which some of the machine operators about the works contended that the slot in the collars was not cut at the right angle with the centre axis of the spindle, which at its deepest part of the cut, as shown by line (a) in Fig. 2.



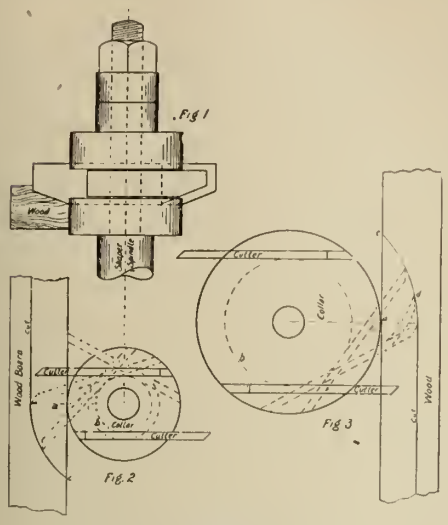


In this the writer wishes to dispel the thought of getting different angles to a cut by having the slot of groove in shaper collars cut at different angles, to give more or less hook to the cutters while in the cut. It cannot be done excepting that the cutters, in their flat position, be nearer or farther away from the centre of the spindle or shaft; no matter if the slots in the collars in which the cutters are inserted were cut in a triangle, to receive three cutters instead of two parallel to each other, as they are usually cut, there would be positively no difference in the cutting unless the collars were larger or smaller, so that the cutters could be placed nearer or farther away from the centre, or tangent to the dotted circle. The same holds good with planer and molder cutterheads; it matters not whether the heads be two, three or four-winged, or more; a difference as to cut can only be created by having the flat of the cutters opposite the centre or axis of the spindle nearer or farther away from this axis, provided the circle scribed by the cutter edge is the same.

By comparing Fig. 2 and Fig. 3 one can readily see that Fig. 3, or the head with the cutters set farthest away from the centre, has the greatest hook when in the cut; all else being equal, this holds true with all cutterheads except those made on the Shimer principle. This is what the writer is trying to explain in Figs. 2 and 3. By shifting the cutters shown by the dotted lines, around the dotted circles, thus bringing them at different angles, but the same distance from the centre, they have the same angle in the cut in each size of head and the same depth of cut for each head, large or small. We have not revolved the spindle, but by the simple shifting of the cutters have obtained the same results in each case as though we had been running the machine.

Another false impression that many machine men have about cutterheads, also set forth by some machine build-

ers, is that a large cutterhead, or one describing a large circle, works easiest. Measuring the line from (a) to (c), in Figs. 2 and 3, it will be seen that the



Projection of Shaper Cutters.

large head is doing one-seventh more work than the small one to obtain the same results. In other words, it takes one-seventh more power to do the same work with the large head, as shown, than with the small one, and the deeper the cut and the larger, the more power required in proportion. The only redeeming feature a large cutterhead has, is that the cutters have more hook and tear themselves through in this way, but the saving created here is again consumed by the power required to keep the larger head in motion, or up to speed, against the wind pressure produced. Cutters are often bent, as shown at (d), to produce both hook to deep-cutting cutters and add to their strength while doing work on this order.

Fig. 1 shows part of a shaper spindle with cutter (s) in position while in the cut; its relative position and proportion of cut is the same as that shown in Figs. 2 and 3. The sketch will explain this better than words.—Wood Worker.

THE MAXIMUM DEVELOPMENT OF THE STEAM ENGINE.

ALTHOUGH would-be prophets have frequently set limits to the development of the steam engine, these limits have one after the other been passed in practice. An attempt is made here to determine if there is any physical reason for setting a limit to the increase in steam pressure and temperature beyond which it will not be possible to go. We have already reached a stage where we can use iron worked red hot, but we can not see that such high temperatures appear likely to occur in the steam engine, even though the temperature in the internal-combustion engine be considerably above red heat. The critical temperature of water and of steam is said to be about 700 degrees Fahrenheit, at which point steam and water have the same specific density and possess the same specific heat. When heated above 700 degrees steam dissociates into its elements. Unless the temperature of dissociation be raised by pressure, 700 degrees would appear to be the limit for the steam engine. Steam pressure rises rapidly with increasing temperature, and at 700 degrees Fahrenheit, or 1,161 degrees absolute, the pressure would be 2,840 pounds per square inch — about ten times higher than any that has been used up to this time. At this high pressure steam would be unstable, and it would probably be found to be desirable to allow for superheating in order to prevent this. If 200 degrees Fahrenheit be allowed for

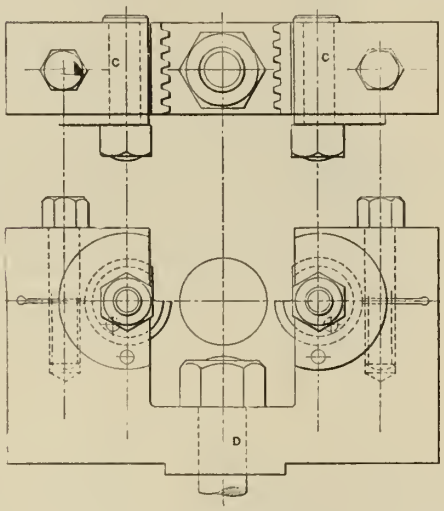


FIG. 1—Double Tool-Post with Circular-Formed Threading Tool.

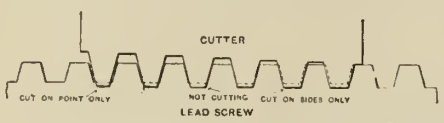

FIG. 2—Illustrating Cutting Action of Tools.

superheating, the absolute temperature of the saturated steam would be 961, which corresponds to about 674 pounds absolute pressure. From this reasoning it seems safe to conclude that it is not safe to set a limit to the steam engine until pressures have attained about 650 pounds by gauge, and temperatures 500 degrees Fahrenheit, with an additional superheat of 200 degrees. — Electrical Review.

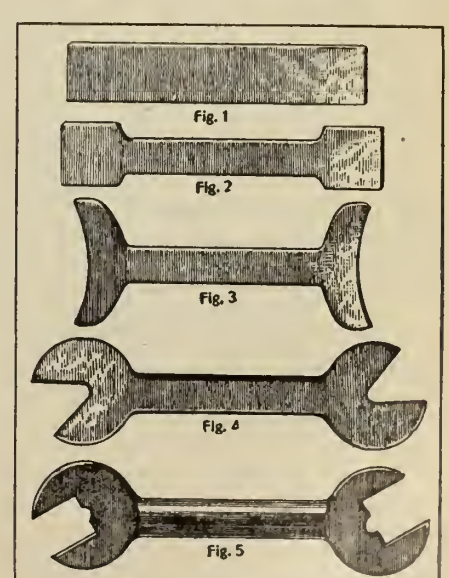
METHOD OF CUTTING LATHE LEAD SCREWS.

THE annexed Fig. 1 shows a method I have used for cutting lathe lead screws which has worked out very well. As usual two cutting tools are used, one in front, right side up, and the other at the back, also right side up, to cut on the reverse trip. The cutting tools in this case were round, like short sections of the screw to be cut but left-hand to cut a right-hand screw. They were cut with the thread on a taper and the outside turned straight so that the leading cutter tooth cut to the full depth that we could take at each traverse and the succeeding teeth widened the cut, only the last two usually cutting in the full side of the thread, as shown in Fig. 2. The limiting element in using this device became the torsion of strength of the screw we were cutting. We found on our 16-inch size that it was cheaper for us to use 1½-inch stock than 1¼-inch on average lengths just on this account because the time saved in cutting more than covered the increased cost of stock.

The bolts (C C) and their washers and nuts were an afterthought and helped to hold the cutters in place. The dowel pins had to be changed every few grindings. Bolt (D) held the device to the top of the cross slide, in place of the tool post.—E.H.F. in Machinery.

HOW TO FORGE A GOOD WRENCH.

FIRST take a file or good buggy spring, according to the size of the wrench wanted, as in Fig. 1. Forge this down 1 in. or 1½ in. from the end, as shown in Fig. 2. Then forge a T on each end and keep the corners round (Fig. 3). Then turn each T on the horn of the anvil and bring one end around a trifle farther than the other, as in Fig. 4. In finishing trim off the ends and square up to suit the nut (Fig. 5). In this way the grain of the steel is forged around each prong,



Forging a Wrench.

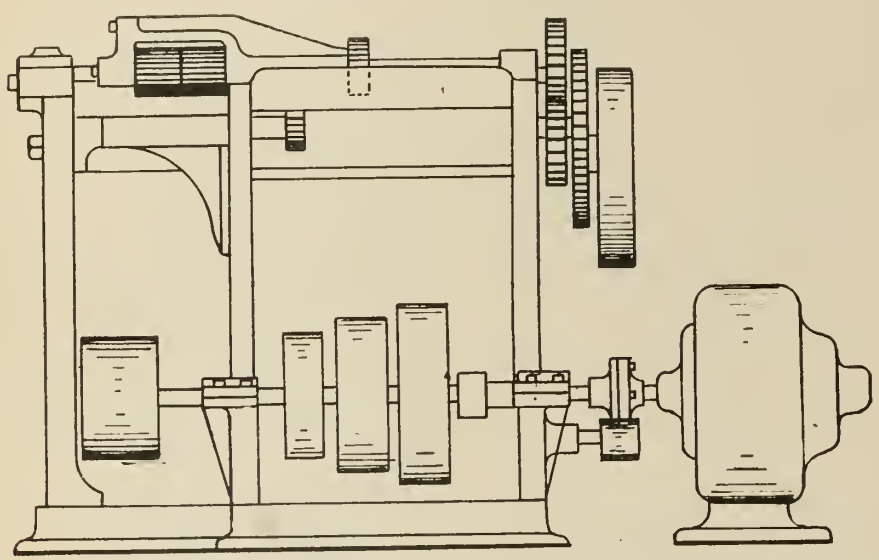
thus making it a good, strong wrench. Never punch a hole and cut it out, as this will make the prongs cross-grained.—Blacksmith and Wheelwright.

Electric Motor in Woodworking Plants

By T. C. Robertson.

ELECTRICITY is attracting greater interest as its possibilities become better known and the appliances necessary for its use become more reasonable in price. Woodworkers are not behind in most matters which affect their interests, especially when it comes to the introduction of apparatus which affects the quantity and quality of their work. Comparisons of the different kinds of power for the driving of machines afford a study of deep interest, and call for careful calculations as well as impartial judgment.

For a number of years electricity has been successfully applied as a motive power and has now attained a reputation which places it entirely beyond the experimental stage. There are now a number of woodworking establishments



MOLDER DRIVEN BY MOTOR

driven by electricity, and the operators seem well pleased with them, and in the near future we will likely see its use in these factories general.

Saving in Electric Drive.

In pointing out the advantages of electrically driven machines, we note first the displacement of a large amount of belts and line as well as counter shafts, thus economizing in power and space. In factories of large dimensions it is estimated that about one-half of the power furnished by the engine is lost in transmitting to the individual machines. This loss may seem large to the man who belts his saw mandril direct from the engine, and it is not applicable in his case, but we must remember in striking an average that there are many woodworking industries which cover enormous floor space, and power must be taken from the engine to the individual machines located on the different floors by means of belts, line and counter shafts. Now, suppose that on the different floors there are machines a considerable distance apart which are run only a few hours in the day, we have probably 50 or 60 per cent. more power required to turn line shafting than is required to run the machines a short period.

In view of the loss referred to it is simply a matter of business to consider any means of saving loss in transmission of power if the proposition does not entail too great cost in equipment of plant. The first thing to do is to demonstrate that a saving can be effected and while this seems to have been done in a number of cases by electricity, still the adoption of such a power seems to gain ground slowly. Perhaps this can be accounted for by a good deal of confusion being generated by estimates having a lack of clearness occasioned by much technical verbiage peculiar to the power under consideration.

In one instance an electrician figured out that the loss between the engine and dynamo was 3 per cent., loss in dynamo 10 per cent., loss in transmission 10 to 15 per cent., incidental loss 5 to 10 per cent., say about 45 per cent. in all. Others figure the loss at about 35 per cent. There seems little doubt that experience teaches that with electrical machines of modern construction that even a smaller loss is sustained.

Other Advantages.

But aside altogether from the question of saving power by electrical transmission, a number of good points can be made in its use. As pointed out, it does away with line shafts and heavy belting, making more room and lessening danger in operation in factory. It gives more room around machines, is a cleaner and more noiseless drive, besides solving the problem of distributing power through the different floors of a large factory in a most satisfactory manner.

Other advantages may be noted. In case of accident one machine may be stopped without interfering with others. The power may be graduated according to the work done. Saving of space for power plant in cases where electrical power can be procured outside of vicinity.

Care Necessary.

Let us now consider some of the difficulties and peculiarities in connection with electric power. The first point is found in care necessary in avoiding an overload in any point of an electric system from generator to the smallest motor. If overload occurs heating will be the result and if continued for any length of time the result will be disastrous to both generator and motor. Suppose for example that a motor is purchased for a certain machine which you want to drive and the estimate is made for an average load, but we are well aware that the average load is often exceeded, especially in woodworking machinery, which would be accompanied with injury to motor. This of course would not occur with a belt drive. It would seem necessary, therefore, that a motor be procured sufficiently large that there would be no slowing down with the heaviest load. This of course applies to generators as well.

In view of these difficulties it is consoling to find in the most recently constructed motors that a perfection is being attained which practically overcomes the difficulty. As a matter of fact the apparatus built to-day will resist more abuse than one could imagine. The improvement consists in installing protective devices in which an overload will cause the current to be automatically cut off, avoiding damage. Almost any builder of such machinery will guarantee 25 per cent. overload continuously without injury to insulators.

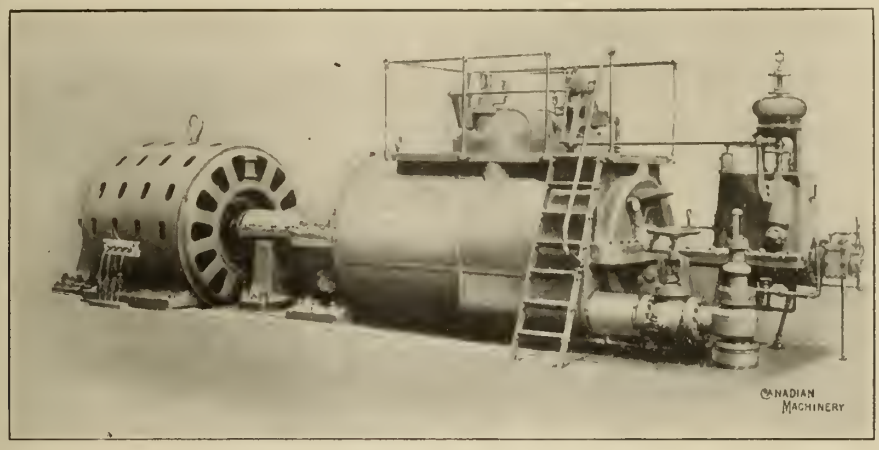
In consideration of these improvements electricity is bound to be the universal motive power of the future in nearly all manufacturing establishments.

The Development of Steam Turbines*

By Prof. Dr. A. Riedler

THE few pioneers who built the first commercial steam turbines were far in advance of their time. The economical control of steam, as well as of dynamic conditions, were lacking, together with suitable materials, the shop facilities, precision of work and. above all, the application and the demand.

The development is unique and peculiar. For a century, the reciprocating engine reigned supreme. Within fifty years



1,000 h.p. Westinghouse-Parsons Generator Unit.

the large industrial units have come into existence, spreading rapidly during the seventies, while the perfect steam engine was not brought out before the end of the century. All of a sudden, the turbine enters, to displace the highest types of reciprocating engines. Ten years ago, the turbine was yet unknown; five years ago it attracted attention. It has been generally appreciated only within the last three years and at the present time power stations use it exclusively.

Since, a few years ago, a great revolution was predicted, we may ask to-day. "What has and what has not been achieved, and what may we expect in the future?" The answer is impossible within a limited time, but facts and experiences can be produced which will give a clear idea of the development and success of the steam turbine.

No Reaction Turbine as Yet.

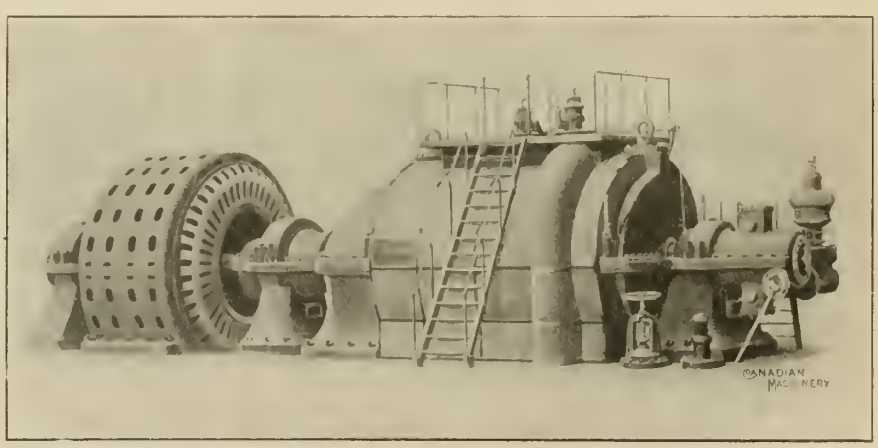
No one has, as yet, built a pure reaction turbine. It proves too intricate and impractical. Turbines with simultaneous reaction and impulse of the steam were brought to perfection by Parsons. His turbine is, at present, the most widely used, with about one and one-half million horsepower in operation. The principle and the simplicity of his turbine is based on the successive expansion of steam in many stages, without separation of the stages from one another, and in the full peripherical steam admission to the wheels of all stages. This principle requires many wheels and from hundreds of thousands to millions of buckets in large turbines.

This objection is offset by an extremely simple construction so that no disadvantage results. It is, however, a drawback to have many wheels running with small radial clearances, which is necesary in order to avoid steam leakage. These small clearances are dangerous with high pressure and superheated steam and they have caused the breaking of buckets. The steam turbine is correct for only one temperature and it is sensitive to changes in thermal conditions. Therefore, the Parsons turbine will have to undergo changes at its high-pressure end, such as are being already tried by Sulzer, in Winterthur, and by Westinghouse. The low-pressure end of the Parsons turbine, however, is excellent and it owes its success to that fact.

Development of Impulse Turbines.

The development of impulse turbines was a great advance in turbine construction. These machines require only half the speed of reaction turbines. The original form which the impulse turbine was given by Laval is not adapted to large nuits, provided, as it is, with a small wheel and gearing. The advance is due to the development of large wheel discs which have been built successfully for peripherical velocities up to 1,200 feet and, furthermore, by the gradual steam expansion in a moderate number of stages, separated from each other by the diaphragms. Rateau was the pioneer in this field, but his machine was brought out with imperfect details and too early, which naturally caused a reaction, though of late most designers are going back to Rateau's fundamental ideas. Several well known turbine types such as that of Zoelly, differ in details from Rateau's construction, but not in principle.

The more recent development of these turbines, with few, but effective, pressure drops is based on the facts that steam nozzles transforming pressure into velocity operate almost without loss, and that when using a correct pressure drop, they can be shaped as simple guide vanes. Thus the machine becomes very simple, with only the disadvantage of having partial peripheral admission in the wheels at the high-pressure end, thereby increasing the rotation loss of the wheels. We are able, however, to fully control superheated steam, applying a quick and effective reduction of pressure, retaining, at the same time, all the advantages of superheat. Heat does not enter the machine at all, being at



7,500 h.p. Westinghouse-Parsons Generator Unit.

* A paper read at the annual meeting of the Society of German Engineers, Berlin, June, 1906.

once transformed into work. The turbine does not suffer under the influence of high temperatures, as do, for instance reciprocating engines. This advantage can be made use of through a gradual velocity drop of the flowing steam, mainly at the high-pressure end. It is on this basis that Curtis and the German General Electric Co. have developed their new turbines, of a very simple and excellent type.

Turbines and Vacuum.

Thus, with simple means and few wheels will be possible the commercially most efficient turbine. Turbines can, furthermore, take the best advantage of condensation while reciprocating engines cannot. To these, a high vacuum causes thermal losses and the necessary areas of passage in the low-pressure steam chests as well as in the exhaust piping, connot be provided for. Owing to its own very low resistance, the turbine on the other hand, can use the highest vacuum to the best advantage, gaining in output both by this vacuum and the reduced wheel friction.

Perfect Accuracy in Manufacture.

The success of the turbine is also due to the excellent development of all details, mainly of the wheels and the buckets. The working speeds for the operation of generators average between 1,500 and 3,000 revolutions per minute. The necessary safety in operation is obtained through careful figuring and design, through safety governors preventing excessive speed, through careful automatic lubrication of all parts, while the governor stops the machine automatically if the oil circulation should be interrupted. Such precautions are necessary, since the increase of speed in turbines cannot be seen or heard, as in reciprocating engines, but remains almost unnoticed; besides, the operation of engines at such a high speed must be assured through great precision of workmanship and care in erecting. While the practice in high-class reciprocating engines requires an accuracy of a few hundredths, modern turbine practice demands a precision of a few thousandths of an inch, chiefly for the balancing of the wheels and the pivoting and control of dynamic effects in general. The requirements which such precision entail on the workshop are extraordinary and signify a radical change. Such precision, however, must be permanently maintained in operation; hence, the most careful automatic service with automatic oil circulation, oil cooling and the above mentioned safety devices. The steam turbine operates either in perfect condition—or not at all. When in perfect condition, it runs without attendance. Should anything fail, owing to inaccuracy or defects, the parts concerned will be completely destroyed in a few seconds. Compared with the reciprocating engine, a great advantage results from these peculiarities. It is, that turbines, once correctly built, remain constant, always with equal efficiency working at the same water rate, without requiring much attention or cost of maintenance, while reciprocating engines must be taken apart after a certain working period. Several turbines can be attended by one man, whereas large reciprocating engines requires several men per unit.

The Field for the Turbine.

The largest field for turbines is in connection with electrical engineering, which, at first, called to its help the high speed reciprocating engine, but it could not get rid of it too quickly for large-scale work. Then, it was necessary to make an unsatisfactory compromise with low-speed reciprocating engines. Electric motors run at high speed, have neither reciprocating forces nor crank motion and they succeeded very rapidly as a consequence. The turbine is the natural continuation to this, forming a homogeneous and logical connection.

Other Advantages of the Turbine.

We should also enumerate the other advantages of the turbine. First of all is the small space required. A turbine capacity of six to eight times that of the reciprocating engine can be provided for on the same floor space. The saving in expense of foundation, building and erecting is very considerable. We have the additional advantages of convenient handling, simple attendance, sparing the personnel from undue strain, and the readiness for starting at any time, in so far as this is not impaired through small bucket clearances.

Where the Turbine Cannot Replace the Reciprocating Engine.

We are, therefore, justified in considering only the turbine for power stations. As a shop motor, however, and for small units it cannot yet replace the reciprocating engine. On the other hand, it is well suited to the driving of high-speed machine tools, centrifugal pumps, blowers and compressors, the development of which will be greatly advanced through the turbine. The low-pressure turbine also finds a wide field of employment, by the use of hitherto wasted exhaust steam from the numerous imperfect steam plants. In these cases the exhaust heat is being stored in accumulators, so as to allow the simultaneous running of exhaust turbines with irregular steam exhaust.

The Manufacture of Turbines.

The remarkable development of turbines and their extreme value in electrical engineering have caused several great electrical concerns to begin the manufacture of turbines as a branch of their regular work, while others have entered into close connection with turbine construction and many leading engine concerns have started building them on a large scale. The manufacturing rights and the different organizations are distributed over all countries.

To the question, "What has been achieved and what may be expected in the future?" we can now give the following answer:

A development of unprecedented rapidity of one of the most difficult motors unique in the history of mechanical engineering; a momentous advance of the highest importance, principally to electric engineering; a sweeping victory in the power station field, although the development of perfect condensers is slightly lagging. The turbine of small size, however, does not yet give full satisfaction in all instances, nor is the marine turbine, as yet, quite developed, being obliged, as it is, to meet special unfavorable conditions.

Summary.

For stationary purposes, the turbine is economically superior to the highest type of reciprocating engines; that is, in its steam and coal consumption. For power plants the turbine is without competition. The latest high-class reciprocating engines of several thousand horsepower were the first, and, at the same time, the last ones of their type. The turbine has displaced the steam engine just as it had reached perfection. For power plants, the turbine is no longer the motor of the future, but of the present.

Stationary turbines present difficult problems because of the required low steam consumption. It is the same with marine turbines, where the coal consumption and radius of operation are the most important factors. In addition, special unfavorable conditions enter, arising from the ship itself and its propeller speed and the high speed of the turbine, which admit only of an unfavorable compromise for the turbine. High velocity of the propeller increases its resistance and losses, while its slow speed means a slow-running turbine and is consequently undesirable. In spite of this, the turbine should consume less steam than a similar reciprocating engine, as it would have to cover the increased losses of a high-speed propeller. The greatest handicap is the lack of systematic experiments on high-speed propellers giving a proper efficiency. The consequence is, a groping in darkness with velocity of from 1,000 down to 150 revolutions per minute, which means from ten-fold to double the present propeller thrust on several propellers and shafts, as Parsons tried to solve the problem, is most intricate and cannot be regarded as final.

BOOK REVIEWS

Scientific Business Letter Writing.—Dealing with the vital factor in the promotion of modern business from a business man's standpoint, by L. E. Ludwig, expert correspondent. 250 pages; price, $1.00. Chicago: Publicity Publishing Co. In this valuable book the author goes into the matter of business letter writing in a thorough manner commencing with the mechanical details, going through and discussing the various phases and situations of the requirements in modern business. It is pointed out that the first requisite of a correspondent is: "He must have a firm belief in what he says." A certain ease and fluency with an orderly way of presenting ideas counts more than the use of grammatical training. The book is designed to be of use to beginners as well as to those of experience. Many a business man with reputation of years of success could no doubt find in this book ideas that would be well to act upon in various contingencies.

Steam Turbine Engineering.—By T. Stevens and H. M. Hobart. An exhaustive treatise on the subject of the steam turbine. 516 illustrations, 814 pages, price $6.50 net. Toronto: 27 Richmond street west, the Macmillan Co. No previous work on the subject of the steam turbine has been published on such an ambitious scale as the volume under review, comprising as it does the theory of the steam turbine from start to finish, both from an engineering and practical standpoint, covering the general field of turbine practice and entering into detail with regard to manufacture. Illustrations and drawings in this book are particularly good. Tables have been compiled and curves drawn from various actual tests, showing the usefulness and also the limitations of this prime mover. No space is taken up with historical matter, but on almost the first page are to be found figures to serve as reference to those interested in the subject. A particularly valuable feature of the book is the bibliography of the steam turbine from 1898 up to the end of 1905. This book is well printed, well illustrated, a good quality of paper being used, and will prove a welcome addition to engineering literature on the subject of the steam turbine.

Air Compressors and Blowing Engines.—By Chas. A. Innes, M.A., lecturer on engineering at Rutherford College, Newcastle-on-Tyne. 290 pages, illustrated with halftones and numerous drawings; price, 4s. 6d net. London: The Technical Publishing Co., Limited. Being specially adapted for engineers the author enters into the mathematics of the subject without much ado, and continues throughout treating the matter from a scientific standpoint. The work deals with the construction of blowing engines and air compressors, being reprinted from a series of articles which appeared originally in the Practical Engineer. The first chapter discusses the properties of air, and shows how to calculate the work required for compression under various circumstances. The second describes several experiments with compressors, and explains the methods of calculating the various efficiencies. The third deals with the theory of valves for equalization of pressure, and the fourth is devoted to the construction of blowing engines. Chapter V. commences the description of air compressors, which have self-acting valves. The remainder of the book is devoted to those with mechanically controlled valves.

Mechanical Draft.—A practical handbook for engineers and draftsmen, by J. H. Kinealy, M.A.S.M.E., formerly professor of engineering at Washington University, with 27 original tables and 13 half-tone plates; 142 pages; price, $2.00. New York: 123 Liberty street, Spon & Chamberlain. The author has assumed on the part of the reader of this book a knowledge of boiler and engine plant. It is designed to facilitate the practising engineer who is called upon to design plants and who must therefore decide when it is best to use some form of mechanical draft. In the general arrangement the book opens with a discussion of the systems of mechanical draft. Forced draft is then dealt with and its advantages and disadvantages discussed. Induced draft is dealt with in the same manner. The proportioning of fuel and air is an important matter and is treated at some length. The subject of draft is then dwelt upon in a general manner followed by chapters on economizers and fans. The final chapter takes up a calculation of proportioning the parts of fans. This book is of real service to all interested in the subject of mechanical draft.

Indicator Handbook.—A practical manual for engineers, being part II. dealing with the indicator diagram, its analysis and calculation. By Chas. N. Pickworth, editor of the Mechanical World. Third edition, 134 pages, illustrated with diagrams. Manchester: Emmott & Co., Limited. In Part I. the author takes up the construction and application of the indicator. This volume deals specifically with the indicator diagram. The effects upon the steam distribution products by defective valve gear and other influences are discussed, while compound engine diagrams and various methods of combining them are dealt with in the following section. A valuable feature of this book in view of the largely increasing use of internal combustion engines is the considerable space devoted to the gas engine diagram. Diagrams from air compressors, air and water pumps, ammonia compresing machines, etc., also receive a larger share of attention than usual.

Water Softening and Treatment.— By William H. Booth, M.A.S.C.E. Treats of the condensing plant, feed pumps and heaters for steam users and manufacturers. 308 pages, well illustrated; price, $2.50 net. New York: D. Van Nostrand Co. As explained by the author the subject of the treatment of water for a steam boiler and manufacturing purposes is a question of prime importance to the steam user, so that no apology is necessary in attempting to bring some of the chief facts connected with the softening of water to the minds of steam users. The finer points of chemistry are not entered into this book, but methods treated of are confined to simple reactions and commercial agents. One of the conditions in which soft water is an essential is taken up in connection with delicate coloring in dye works. Again in the tan yard the presence of lime carbonate in the hides destroys tannin, converting it into lime tannate, which means not only a loss of tannin but detracts from the quality of the leather. A plea is entered for better and more scientific practice in connection with the use of feed water, based on a recognition of those factors on whose permanence and durability depend. The book is divided into five sections, devoted in turn to the treatment of water by softening, oil separation and filteration; air pumps, condensers and circulating pumps; feed heating, stage heating; water cooling; feed pumps and injectors. The author is well known in connection with his already published books on liquid fuel and its combustion, smoke prevention and fuel economy, and his book published in this instance is not behind in quality to those issued earlier.

Power and Transmission

Steam Gas Electricity Compressed Air Water

TEST OF PUMPING PLANT.

IN view of the high efficiency reached by the new pumping plant installed for the City of Montreal on McTavish street, the report of the recent official 24-hour test will be found of interest. The plant consists of a 14-inch 3-stage Worthington centrifugal pump built by the John McDougall Caledonian Iron Works Co., Limited, direct connected to a 400 h.p. induction motor built by Allis-Chalmers-Bullock, Limited. The test was conducted by Mr. George Janin, superintendent of the water works department, and Prof. L. A. Herdt, of McGill University, who reported as follows :

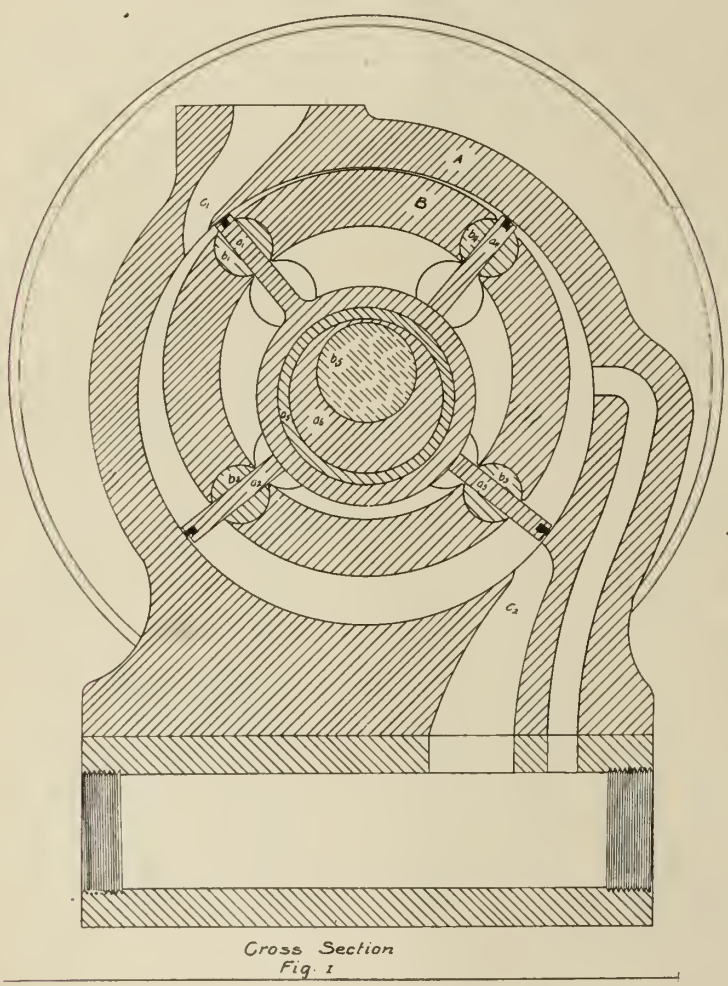


FIG 1.—Cross Section, Free Rotary Engine.

"As the test was to be made in conformity with clause 9 of the contract, on the capacity of the said pump, which was to be five million imperial gallons per 24 hours against 110 lbs. pressure, this condition was amply fulfilled, the total number of gallons pumped being 5,470,000 . The said clause also specified that the test should show that the temperature of the motor working under a full load for at least 12 hours, should not be more than 40 degrees C. above the temperature of the room. The results on this test showed that the temperature never rose beyond 30 degrees C. above the temperature of the room.

"In accordance with clause 10, the ordinary working of the pump and motor was not to cause any notable noise or vibration. During the test, as also during the trials preceding the test, this condition was perfectly fulfilled.

"Clause 11 specified that the pump was to attain an overall efficiency of not less than 65 per cent. The test showed that during normal working, that is to say, with a discharge of five million imperial gallons per 24 hours, this efficiency was attained, and during the period when five and three-quarter million gallons were being pumped, an efficiency as high as 67 per cent. was attained."

The committee was well pleased with the report and it was decided to make the first payment on the plant.

THE FREE ROTARY ENGINE.

AS shown in section in Figs. 1 and 2, the free rotary engine consists of a stationary cylinder or casing (A), a revolving drum (B), which is pressed and keyed onto the shaft (b5), and is concentric with the shaft but is eccentric to the cylinder (A), the distance between the centres being called the "offset." The drum (B) is drilled through in four places and slotted swivels (b1, b2, b3 and b4), shown in Fig. 4, set in. The swivels are made a free fit in their holes. Through the slots in these swivels, work the wings or pistons (a1, a2, a3, and a4). These wings are carried on sleeve (a5), on a hub (a6), which is on the end case and is turned up concentric with cylinder (A), i.e., the cylinder (A), the wings (a1, a2, a3 and a4), the sleeve (a5) and the hub (a6), are concentric with one another, and the drum (B), the shaft (b5) and bearing (b6 and 7) are concentric with one another.

Steam comes through the port (C) into the chamber between the cylinder (A), the drum (B) and the two wings (a1 and a2). As the wings are pivoted on the hub (a6) and fulcrumed on the drum through the swivel, the pressure on the outer part of the wing causes the drum to rotate about the shaft centre, and as the wing (a2) has a greater area exposed to the steam pressure than the wing (a1), the drum turns in the direction from (a1 to a2).

When the drum is turned, so that the wing (a1) is down beyond the steam port, the chamber (a1, a2), is cut off from the steam supply and the steam in chamber (a1 and a2) works the drum around, expanding till the wing (a2) uncovers the exhaust port (c2), when the steam is released. Also, when the

wing (a1) is moved down past the steam port, steam comes into chamber (a4, a1), and starts to do work, so that the torque is uniform and constant, thus doing away with the need of a flywheel.

On each side of the drum (B) are two flanges, (b8 and b9), Fig. 2, (b9) being cast with the drum and (b8) being removable to allow the placing of the wings and swivels. These flanges are not in contact with the sides of the cylinder (A), but a steam-tight joint is made by means of the cylinder rings (a7 and a8), which are on the centre of the cylinder (A) and held out by light springs against the flanges, which are on the shaft or drum centre. The advantage of having flanges and cylinder rings eccentric, is that the rings do not wear in a groove but over a distance on the flanges equal to twice the offset.

The ends of the wings have phosphor bronze strips let into them. These strips are in contact with the cylinder walls and make a steam-tight joint.

Where the shaft comes through the end cases there are double stuffing boxes, which prevent leakage of the steam or oil. The shaft runs in an oil bath, in a babbitt bearing. The engines can be supplied with roller and ball bearings.

No oil is supplied with the steam but oil is forced by an automatic oil pump onto the surface between the sleeve and the hub, the sleeve having holes drilled through it, which allow the oil to escape onto the wings from which it is thrown by centrifugal force onto all the moving parts. This method has been found to insure perfect lubrication.

One or two points are to be noticed in connection with this engine. Each part, perfectly balanced, always turns about its own centre, i.e., there is no eccentric motion of moving parts; the wings, which are carried on the hub concentric with the cylinder, are always in contact with the cylinder and thus make a steam joint independent of springs or centrifugal force; there are no valves or valve gear; these engines are claimed to be lower in weight, require less foundation and have a much lower steam or oil consumption than high grade, high speed engines.

This engine will be manufactured and placed on the market by the Manson Mfg. Co., Thorold, Ont.

FIG. 3.

FIG. 4.—Free Rotary Engine.

LARGE GENERATORS.

RECENTLY the Ontario Power Co., which operates at Niagara Falls, Ont., decided upon the enlargement of its power house capacity and contracted with the Westinghouse Electric and Mfg., Co. for two of the largest power generators ever turned out at East Pittsburg. These machines are of 10,000 h.p. each, and are called waterwheel generators. The Power Company has already installed four machines of a similar type, which were also furnished by the Westinghouse people. This last contract includes switchboard appliances. The additional power apparatus was made necessary by the great demand for electrical energy to operate manufacturing plants in the company's territory.

BEGINNING OF VENTILATING AND HEATING.

HEATING and ventilating engineering history in this country commences with Joseph Nason, who, upon his return from England in the latter part of 1842, began the introduction into this country of the Perkins system of hot water heating, with which Mr. Nason was thoroughly familiar, having been for some years, while in England, in the employ of Mr. Perkins.

In 1846 a radical departure in the method of heating—in this country at least—was made by the warming of the Boston custom house by means of mechanical propulsion of air. A large coil of three-quarter inch pipe was massed in the basement, and from it to the several registers were run ducts of sufficient capacity to carry the warmed air. This plan of warming, while not new in France, was entirely novel in this country, and was the beginning of all subsequent systems in which fans

were employed for distributing air. The fact that this plan of warming had already been employed in France does not detract from the credit due to Mr. Nason, as there is no evidence that while abroad he went to France, and it is highly probable that he was not familiar with the progress that had been made in that country.

In 1855, in which year extensive alterations of and additions to the United States Capitol at Washington were in progress, Mr. Nason, at the request of General Meigs, then in charge there, went to Washington and planned a system of ventilating and heating for the capitol. This was the first really scientific and complete job of the kind done in this country. Mr. Nason, as this job at the capitol shows, had a thorough knowledge of the business as it was then well known, and was at the time unquestionably the best informed and most experienced person on heating and ventilating in the United States.

The apparatus installed under Mr. Nason's direction consisted primarily of a heating surface of wrought iron pipe, over which air was forced by means of two specially designed centrifugal fans, and conducted through ducts to the rooms to be heated and ventilated.

This plan of having a large amount of heating surface located in one place and the air blown through it, the heated air being then conducted to such places as it was needed, was for some years the favorite mode of heating. Some years after a job of this kind was put in the new post office at Washington. It was also placed in several insane asylums.

In the late fifties B. F. Sturtevant began his work in Boston, which eventually led to his building up the largest blower business in the world. In the course of ten years he developed the blower and its uses to such an extent that it became a recognized factor in satisfactory ventilation. He replaced the U. S. capitol fans with others of more modern design, and about 1870 entered the market with a unit combination of fan and steam heater. From the somewhat crude design of that day has been evolved the present type of fan blower heating apparatus to be found in every important public building and in thousands of industrial plants throughout the world.

Compiled in part from article by R. T. Crane, in the Valve World.

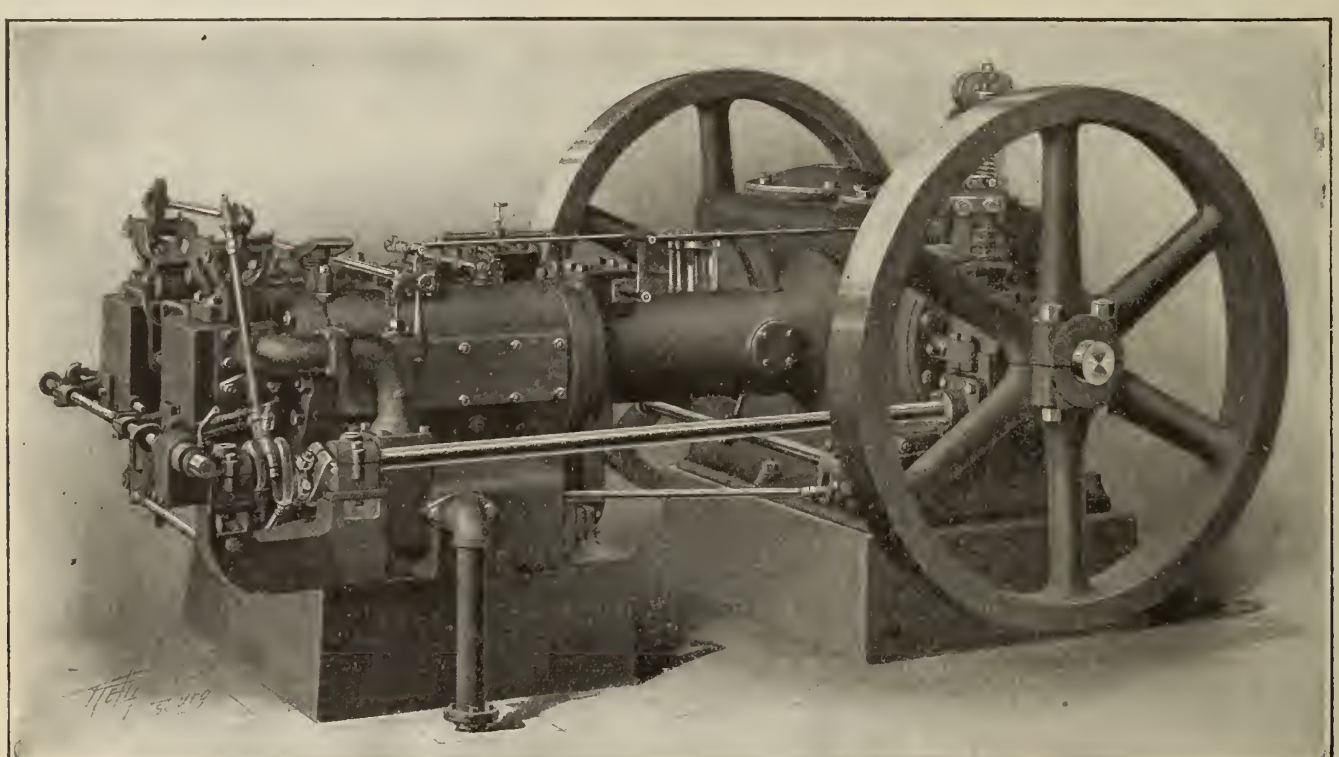

FIG. 1—New Buckeye Gas Engine.

NEW BUCKEYE ENGINE.

A NEW two-stroke cycle gas engine has been developed by the Buckeye Engine Co., Salem, O., which is specially adapted for direct connected dynamo driving, and which operates on producer gas, but which can be adapted to run on any other kind of gas, gasoline or distillate. The engine is a single-acting, scavenging twin engine, and is built in sizes ranging from 25 to 500 brake horse power. The engine has two motor cylinders, with cranks set at 180 degrees, and is provided with two fuel pumps and two air pumps. The accompanying illustration is a general view of the valve side of the engine, showing the secondary shaft operating the valve gear. The piston has a double duty to perform, namely, as well as delivering the power of the explosion to the crank shaft, it compresses the charge in an auxilliary chamber for delivery to the combustion chamber. The crosshead also has a double duty in that it acts as a plunger in an air pump compressing air in a chamber between the crosshead and the cylinder. Each piston compresses its own explosive mixture, and each crosshead plunger delivers compressed air or the scavenging of the combustion chamber of the other half of the engine unit. The cycle of operation is as follows :

When the piston uncovers the exhaust ports, the scavenging valve is opened by the valve gear and compressed air at about 8 pounds pressure is admitted to the combustion chamber from the air pump of the other cylinder. This sweeps out the burnt gases, and the admission valve is then opened, admitting a charge of gas and air from the compressor chamber, which charge is also at about 8 pounds pressure. The piston further compresses the charge on its back stroke, as usual, and the charge is ignited by electric spark. As the piston travels back, compressing the charge in the cylinder, it draws a fresh charge into the other end of the cylinder, and the cross-head plunger

similarily draws in a charge of air. The admission and scavenging valves are operated by wiper cams.

The governor is of the flyball, spring-opposed type, controlling the position of the balanced throttle valves in the fuel passages. Thus the engine is governed by regulating the richness of the fuel mixture.

The engine is equipped with both make-and-break and jump-spark igniters.

The valve gear is susceptible of adjustment for varying the compression and expansion in the working cylinders; the fuel valve can be set to close at any point between the beginning of the compression stroke and half-way of the stroke, thus changing the compression pressure and the release pressure. With the valve closing at half stroke, for example, the gases would be expanded to 1 2-3 times their original volume if the clearance volume were one-fourth the displacement of the piston. The engine can also be adjusted so that the mixture after admission to the working cylinder is at 4 or 5 pounds pressure above the atmosphere, increasing the capacity at a slight sacrifice of thermal efficiency.

The accompanying indicator diagrams were taken from an engine with cylinders 9x12 inches, capable of about 75 horsepower. This engine, it is stated, has a mechanical efficiency of over 85 per cent.

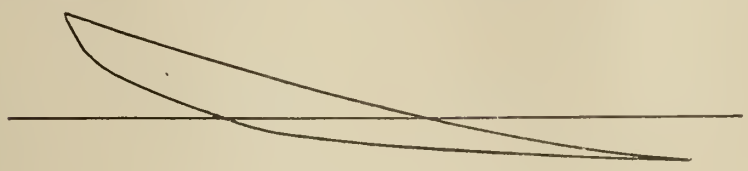

FIG. 2.—Full Pump Diagram; Buckeye Engine.

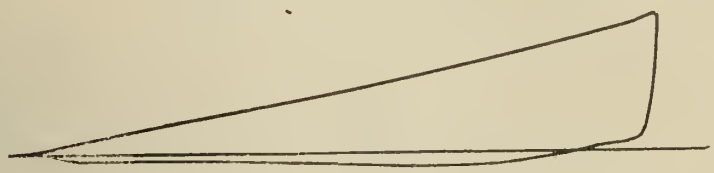

FIG. 3.—Air Pump Diagram; Buckeye Engine.

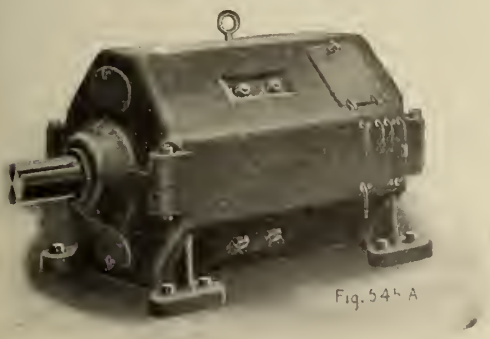

Motor for Rolling Mills.

MOTORS FOR ROLLING MILLS.

DIRECT current electric motor, type "W," recently placed on the market by the Crocker-Wheeler Co., represents the latest ideas developed to meet the heavy demands of rolling mill service, which require a completely enclosed motor for intermittent but very heavy and jerky work. The suggestions of the best mill engineers throughout the country were invited and have been utilized.

This motor is built for outputs of 25 h.p., 50 h.p., 75 h.p., and 100 h.p., 220 volts only, one speed only, series or compound.

The parts of the motor are very simple and very heavy; and the strength of the parts corresponds approximately to the parts of ordinary motors of about twice the rated capacity of these machines. They are completely enclosed, even the ends of the bearings being sealed so that no particles of dust can enter; and yet the motor can be completely disassembled by lifting the top half after removing four external bolts. The armature is so designed and proportioned with reference to the field that these motors will operate in both directions, under ordinary overloads, without sparking. They are insulated with fire proof material and can be operated in the warmest places.

A complete description of these motors is given in bulletin No. 66, copies of which can be obtained by addressing the Packard Electric Co., Limited, who look after the interests of the Crocker-Wheeler Co. in Canada, at their head office, St. Catharines, or at their offices in Montreal or Winnipeg.

THE CONDITIONS OF FAN BLOWER DESIGN.

THE velocity with which air escapes into the atmosphere from a reservoir is dependent upon the pressure therein maintained and upon the density of the air. The pressure per unit of area divided by the density per unit of volume gives the head, usually designated as the "head due to the velocity." The velocity produced is that which would result if a body should fall freely through a distance equal to this head. In the case of the flow of water such a head always exists; as, for instance, when a stand-pipe is employed to produce the requisite pressure. Suppose the head of water to be 50 feet and its weight per cubic foot to be 62.5 pounds, then the pressure per square foot will be $50 \times 63.5 = 3{,}125$, and that per square inch $3{,}125 \div 144 = 21.7$ pounds. Its theoretical velocity of flow from an orifice at the bottom of the standpipe would be 56.7 feet per second, as determined by the formula for falling bodies, which is $V = \sqrt{2\,g\,h}$ in which

v = velocity in feet per second.
g = acceleration due to gravity.
h = head in feet; here 50 feet.

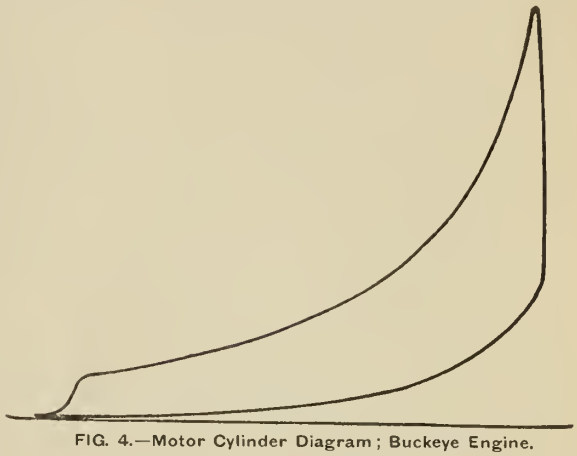

FIG. 4.—Motor Cylinder Diagram; Buckeye Engine.

In the case of air, however, an actual homogeneous head never exists, but in its stead we have to deal with an ideal head which can only be determined by dividing the pressure by the density. As the density of air is so much less than that of water it is evident that for a given pressure the head will be far greater in the case of air. But the velocity of discharge is dependent only on the distance fallen which is represented by the head, whether real or ideal. As a consequence, air under a stated pressure escapes at vastly higher velocity than water under the same conditions. Calculated in the same manner the velocity of escaping air under a pressure of 21.7 pounds per square inch is 1,626 feet per second. By the employment of formulae based upon this theory the elaborate basis tables published by the B. F. Sturtevant Co. have been calculated.

From the preceding discussion it is evident that the pressure created by a given fan varies as the square of its speed. That is, doubling the speed increases the pressure fourfold. The volume of air delivered is, however, prac-

tically constant per revolution, and therefore is directly proportional to the speed.

The work done by a fan in moving air is represented by the distance through which the total pressure is exerted in a given time. As ordinarily expressed in foot pounds, the work per second would, therefore, be the product of the velocity of the air in feet per second, the pressure in pounds per square foot, and the effective area in square feet over which the pressure is exerted.

From this it is evident that the work done varies as the cube of the velocity, or as the cube of the revolutions of the fan. That is, eight times the power is required at twice the speed. The reason is evident in the fact that the pressure increases as the square of the velocity, while the velocity itself coincidently increases; hence, the product of these two factors of the power required is indicated by the cube of the velocity.

The actual work which a fan may accomplish must depend not only on its proportions, but upon the conditions of its operation and the resistances which are to be overcome. Evidently, it is improper to compare fans when operating under such conditions that these resistances cannot be definitely determined. The simplest and most natural condition of operation is that in which the fan is operated without other resistance than that of the case; that is, with open inlet and outlet. For proper comparison of different fans, the areas through which the air is charged should bear some constant relation to the dimensions of the wheels themselves.

It has been determined experimentally that a peripheral discharge fan, if enclosed in a case, has the ability, if driven at a certain speed, to maintain the pressure corresponding to its tip velocity over an effective area which is usually denominated the "square inches of blast." This area is the limit of its capacity to maintain the given pressure. If it be increased the pressure will be reduced, but if decreased the pressure will remain the same. As fan housings are usually constructed, this area is considerably less than that of either the regular inlet or outlet. It, therefore, becomes necessary, in comparing fans upon this basis, to provide either the inlet or the outlet with a special temporary orifice of the requisite area and the proper shape, and make proper correction for the contracted vein. The fan is thus, in a sense, placed in a condition of restriction of discharge, which it approaches in practice only in so far as the resistances of pipes, passages and material through which the air must pass have the effect of reducing the free inlet or outlet of the fan.

The square inches of blast, or, as it may be termed, the capacity area of a cased fan, may be approximately expressed by the empirical formula:

$$\text{Capacity area} = \frac{DW}{X}$$

In which

D=diameter of fan wheel, in inches,

W=width of fan wheel at circumference, in inches.

X=a constant, dependent upon the type of fan and casing.

The value of x has been very carefully determined by the B. F. Sturtevant Company for different types of fans, but these values must be applied with great discretion, acquired through experience and a thorough knowledge of all the conditions liable to affect the fan in operation.

A 20-INCH IRON GROOVED WHEEL.

ILLUSTRATING some of the large work done in Canadian plants, a cut is shown of a cast iron rope sheave, twenty feet in diameter and with seventeen grooves for 1½ in. diameter manilla transmission rope. The pulley as it appears is on the balancing ways in the machine shop of Dodge Mfg. Co., Toronto Junction. Where it was cast and turned, the finished weight was 30,000, lbs., and was judged by the inspector for the purchaser to be one of the nicest large castings he had ever seen.

The wheel incidentally shows the facilities of Dodge Mfg. Co. for turning out heavy castings and machine work.

IT PAYS TO READ ADVERTISEMENTS.

I HAVE noticed that some subscribers to engineers' journals make a big kick on account of their many advertising pages, then again I have seen engineers refuse to subscribe for the same reason.

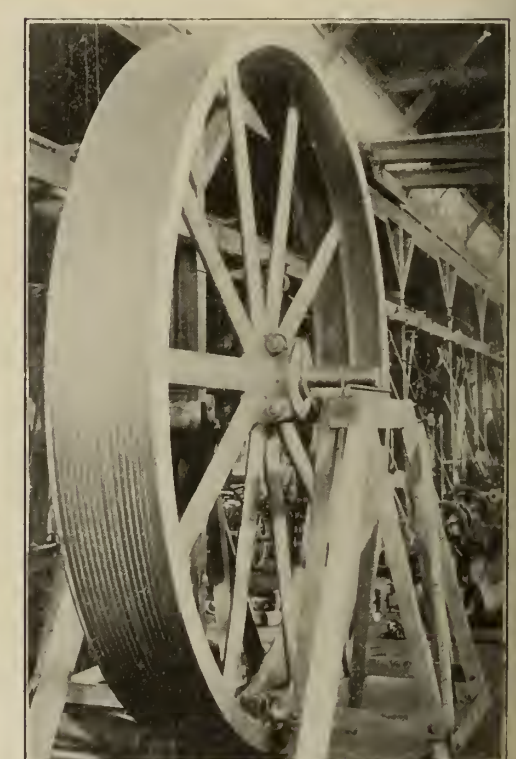
I have found that I get a good deal of information out of the advertising pages, and the more advertising pages there are, the better I like the paper. One keeps posted on the new things which are without doubt very valuable to the man in charge of a power plant to know of, and for this reason alone he should read the advertising pages as carefully as the reading matter.

I wish to relate a few points where I have found the advertising pages of an engineering journal of assistance to me in my work.

The outboard bearing of an engine started to heat one day and we did everything we knew of to make that bearing run cool. Grease was used in the bearing, and to keep things going we had to use graphite mixed with cylinder oil. I noticed an advertisement of a grease which, it was claimed, would make any bearing run cool, and also last much longer than other grease or oil. A small can was ordered from a local dealer, and with it we found that the bearing ran much cooler than before, with less trouble and worry. If I had not have read the advertisement perhaps we would not have heard of the grease.

The piston rod of an engine could not be kept tight with the packing we were using. In the advertising pages of a paper we found just the thing we wanted. Sending for a catalogue to the advertiser, we got full information of their packing, how to order and the price.

Another case was that of a steam line upon which was a union of the malleable iron type and a gasket was used between the two parts of the union.



20-foot Dodge Rope Pulley.

This union could not be kept tight without renewing the gasket about every two weeks.

One day while reading the advertising pages of an engineers' journal I noticed an advertisement of a union, in which it stated that the union would stay tight under all conditions. I thought of that union in the steam line and its troubles, ordered one of the unions at once, and when it was put into place there was no more trouble with a leaky union in that steam line.—H. Jahnke, in Power.

In the up-to-date mill of the near future all small band saws will be fitted by machinery, just as the big band saws for logs now are.

Machinery Development

Metal Working **Special Apparatus** **Wood Working**

NEW AUTOMATIC RACK CUTTER.

HEREWITH is illustrated a new full automatic rack cutter, recently placed on the market by Geo. D. Wolcott & Son, Jackson, Mich. Fig. 1 is a view of the machine with the cover off, showing the mechanism.

3 RETURNED Nov 1/06 to Quinn Cat No 56 Page No 97 asw.

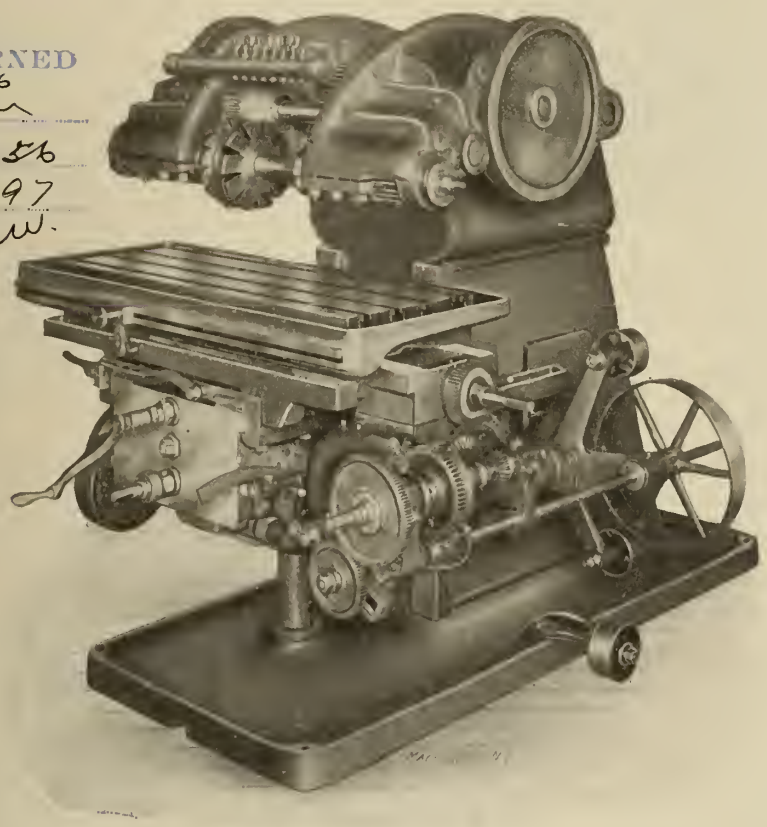


FIG. 1.—Automatic Rack Cutter.

The cutter spindle is driven from both ends, this method of driving being adopted to eliminate vibration and also to secure a powerful drive. The cutter arbor is shown in Fig. 2, together with the two spindles that drive it. (A) is the cutter arbor, having a tongue at each end fitting into slots in spindles (B) and (C). One end of the arbor (A) has a flange integral with it, and the other end is threaded for the nut which secures the cutters. The spindles are hollow and provided with two long studs (D) and (E), which screw into threaded holes in the ends of the spindle; the other ends of the studs are drawn up by the hexagonal nuts (F) and (G) against the washers (K), the inside one of which is of fibre. The flange (H) on the spindle (B) is integral with the spindle, but (I) is a collar threaded to fit fine thread on the spindle (C). This permits adjustment end ways. The collar (I) is split and clamped securely to the spindle (C) when adjusted. Fig. 3 shows the feed and quick return mechanism, the feed by worm gearing and the quick return by bevel gearing. The usual clutch is employed, actuated by a lever from the feed trip dogs.

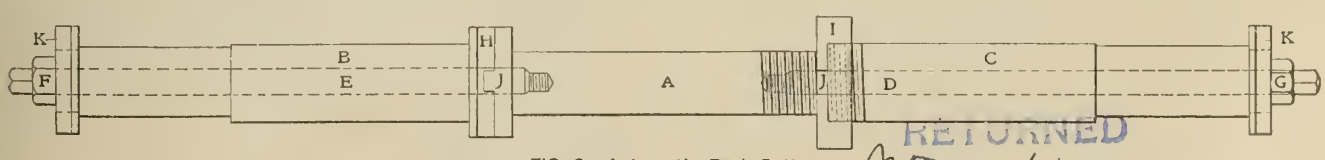

FIG. 2.—Automatic Rack Cutter.

RETURNED Nov 1/06

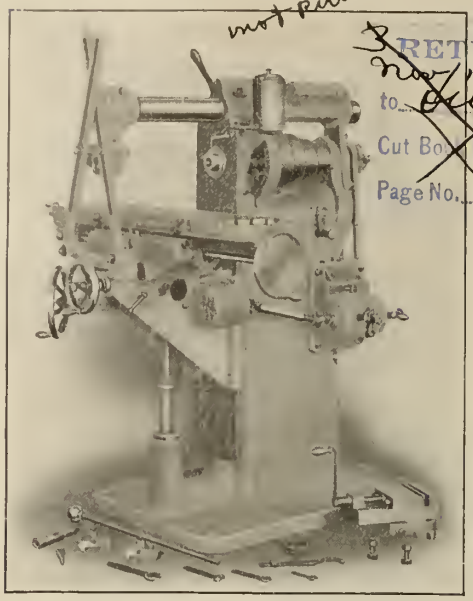
The main drive of the machine is to a cone pulley, and from it a train of gears on either side of the machine drives the spindles. Another train of gears drives the cone on the left side of the main housing and this cone is connected by belt with the cone on the knee which drives the feed and quick return mechanism. On the right side of the machine is the indexing mechanism, driven from above. It consists of two disks, one for a stop and one for a roller. The stop disk is connected with the index screw by gearing. The stop disk and roller disk are connected by a differential shaft and change gears on the front of the apron. As the stop and roller are rigidly fastened together they can both enter only when the opening on the stop disk comes fair with the opening on the roller disk. Thus when the stop and roller are withdrawn the stop disk may make any number of turns, from one to twelve, before the stop can enter again, by varying the multiple indexing change gears on the front of the apron. The change gears are so calculated that a single tooth of each pitch rack to be set over corresponds to a whole number of turns on the stop disk. Thus, having placed the proper change gear for any pitch of rack on the screw, and having placed the multiple indexing change gears on the front of the apron to set over the work the desired number of teeth, when the stop and roller are withdrawn by the indexing trip dog, the table will be automatically moved over the correct amount for the required number of teeth of the given pitch.

On the left-hand side of the machine below the table slide there is a chain which leads from a stop and over a pulley at the back of the machine up to the shifter rod. An adjustable lever on the front of the cross rail releases the chain thus shutting down the machine. The adjustable lever can be set to shut the

machine down when the table reaches any desired point either at or before the end of the blank is reached. The machine will mill a rack 36 inches long by 8 inches wide one diametral pitch or finer. It will index over any number of teeth within the capacity of the machine. It has a range of feeds from ½ inch to nearly 6 inches per minute and will cut one diametral pitch in steel, using one stocking and one finishing cutter, with a feed of ¾ inch per minute. With cutters of high speed steel faster feeds may be used. As the arbor has 10 inches of cutter space on it, it can be entirely filled with cutters when cutting the finer pitches, one-half of the cutters being for removing the surplus stock and the other half for finishing.

BROWN & SHARP MILLING MACHINES.

IN the new catalogue issued by Brown & Sharpe Mfg. Co., Providence, are shown two new plain heavy milling machines. These are entirely new in general design and embrace several important changes. Among the new features are the upward extension of the knee bearing on the column, providing a rigid support to the spindle, and a means of clamping attachments to make them practically a part of the machine itself; a clutch which engages and disengages the entire feed mechanism while the spindle is working; clutches for engaging and disengaging the hand wheels, and the inclosing of the back gears within the column. Both machines are provided with automatic longitudinal and transverse feeds, and the No. 2 heavy machine has in addition an automatic vertical feed. In other respects the two machines are practically identical in general design and mechanism.



Brown & Sharpe Heavy Milling Machine, No. 1½.

Each machine is driven from a four-step cone pulley and is back geared, the gears being inclosed within the column, which adds to compactness and rigidity, and thrown in and out by a crank lever on the side of the column just under the cone pulley. With a three-speed countershaft 16 changes of speed, direct and reverse, are obtained. The positive feed is driven by chain from the spindle to the gear case. There are 20 changes of feed, varying in practically geometrical progression. The positive clutch at the end of the spindle, by which the chain drive and consequently the feed works are disconnected while the spindle is running, permits the operator to use hand feed for delicate work, employing the hand wheels.

The extension of the knee slide to the top of the frame furnishes a stiff support for the front spindle bearing. The

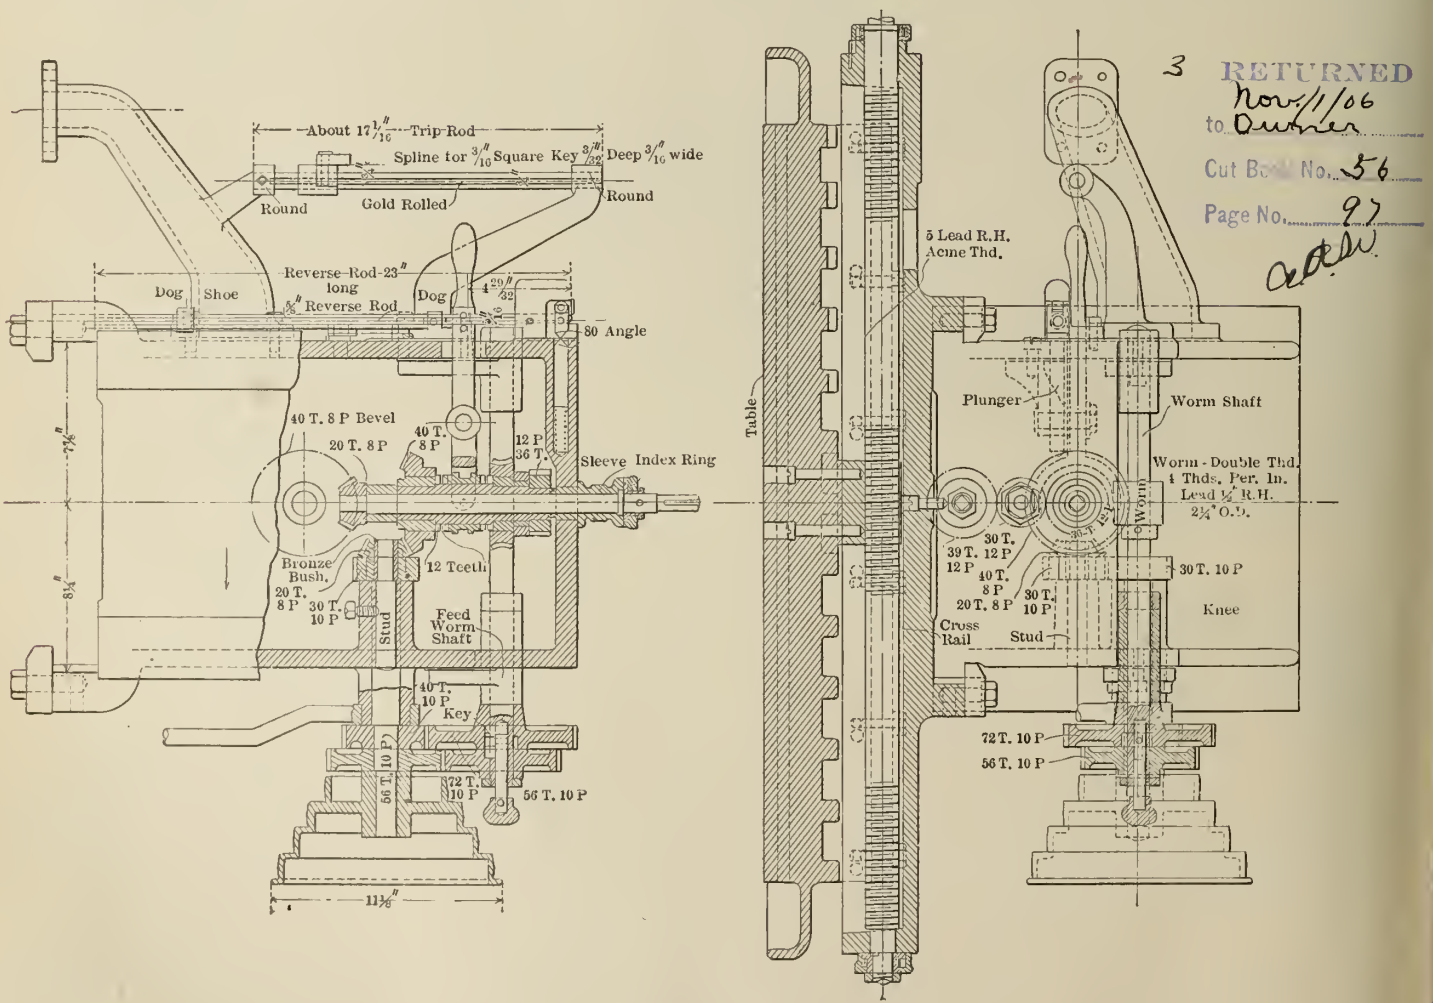


FIG. 3. Automatic Rack Cutter.

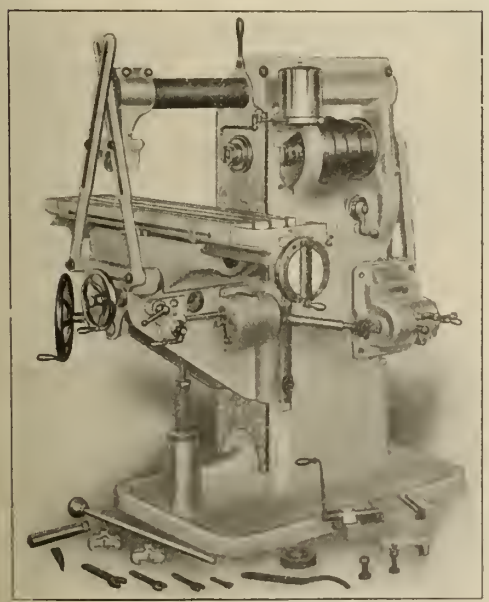
crucible steel spindle, running in heavy boxes of special bronze, adjustable for wear, has a hole its entire length, and the front end is threaded to receive a chuck or large cutter and has a standard taper hole. A guard nut is provided for protecting the thread when not in use. The front spindle box projects beyond the face of the column and forms a support to hold the weight of the attachments and relieve the spindle from the strain due to sustaining this weight. It also affords a boss for use in the quick centering of attachments. The extended knee slide makes it possible to clamp any of the regular attachments directly to the face of the column in such a manner that they become practically a part of the machine casting. The overhanging arm is a solid steel bar that can be pushed back when not in use. It is simply and efficiently clamped at both bearings with one lever at the front of the machine, enabling the operator to make adjustments quickly.

Hand wheels are provided for the cross and vertical feed shafts for use when feeding by hand, the operator being thus enabled to follow the rim of the wheel with his hand and easily see the work. As the vertical feed shaft is placed at an angle the operator has control of the various movements of the machine without changing his position or removing any handles. and any two feeds can be operated simultaneously without interfering one with the other. Each hand wheel is provided with a

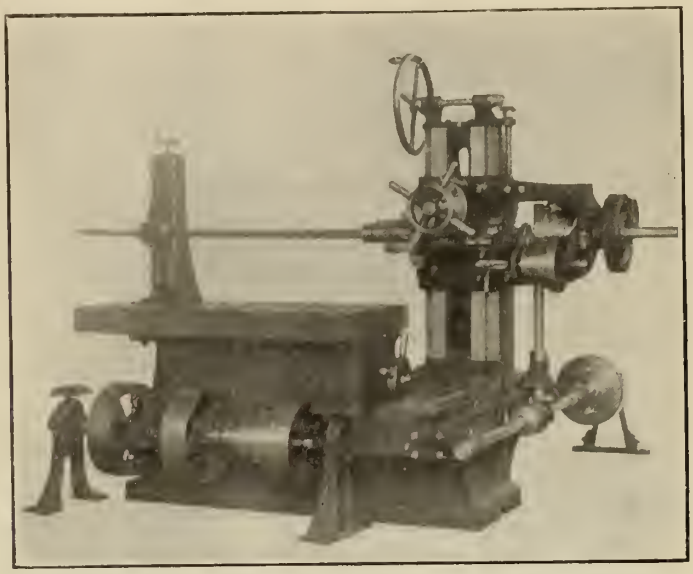


Brown & Sharpe Heavy Milling Machine, No. 2,

clutch that is engaged by a knob at the centre of the wheel, which permits it to remain stationary after adjustment is made and prevents the accidental disturbance of the setting. The levers for controlling the various feeds are located at the right of the knee for convenience in manipulating. One lever on the side of the reverse gear case serves to start, stop or reverse all feeds; the other two levers control respectively the automatic transverse and verticle feeds when machines are so fitted. The table feed screw is not splined, an auxiliary shaft being provided for driving the clutch gears, and as the threads are unbroken the life of the screw and nut is prolonged and the original accuracy maintained. The adjustable dials, tripping mechanism and other mechanical features of the machine are of the standard Brown & Sharpe types.

The No. 1½ machine shown at the right in the engraving, has 16 speeds running from 16 to 318 rev. per min., with eight reverse speeds from 17 to 290 rev. It has a longitudinal feed of 24 in. and a transverse feed of 7 in., both automatic, and a vertical hand feed of 19 in. The 20 changes of feed vary from 0.003 to 0.15 in. per rev. of the spindle. The table has a working surface of 10¼ x 35 in. This machine is adapted not only to tool room use but also to general jobbing purposes, and is a particularly profitable machine for all varieties of the lighter class of milling except the cutting of spirals or work that requires the setting of the table to an angle. The floor space required is 56 x 80 in. and the net weight 2,600 lbs.

The No. 2 heavy machine, shown at the left in the engraving has 16 speeds running from 13 to 439 rev. per min. and eight changes of reverse speeds from 22 to 305 rev. The feeds, all automatic, are: Longitudinal, 28 in.; transverse, 8 in.; vertical, 19 in. The 20 changes of feed run from 0.004 to 0.2 in. to 1 rev. of the spindle. This machine is furnished with hand transverse and vertical feeds when desired. The working surface of the table is 12⅜ x 43 in. The machine occupies a floor space of 61 x 93 in. and weighs 3,600 lbs.



Barnes Horizontal Drill.

NEW HORIZONTAL DRILL.

ACCOMPANYING is an illustration of a new horizontal boring, milling and tapping machine being placed on the market by the B. F. Barnes Co., Rockford, Ill. The machine is adapted for such work as cannot be done to advantage on an upright drill, and is powerfully and rigidly built.

The spindle can be used at any point on a surface 36 inches long and 18 inches high. The machine will be furnished with a boring bar support, as shown in the illustration, if it is desired. The driving cone is fitted with our internal back gears, and the spindle has power feed and automatic stop, as well as hand-wheel feed. A reversing friction countershaft is supplied with the machine. All clamping levers and adjusting hand wheels are readily accessible from the front of the machine.

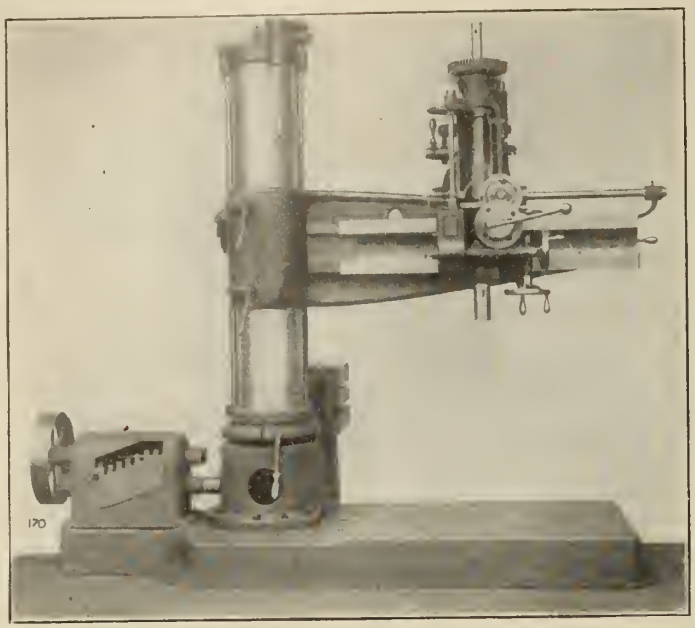
RADIAL DRILL.

THE 4-foot plain radial drill shown in the accompanying engraving is illustrative of three sizes of machines which the Bickford Drill & Tool Company of Cincinnati, Ohio, is just placing on the market.

One of the chief features of this line of tools is the large number of speeds with which they are provided. The speeds vary, of course, with the size of the tool, the minimum speed of the 6-foot radial being adapted to driving a 6-inch pipe tap, that on the 5-foot to a 5-inch, and that on the 4-foot to a 4-inch. The

range, however, is identical on them all. i.e., the maximum speed on each is 13.63 times the minimum speed, the only difference being that each series starts from a different figure.

The speeds on the 4-foot radial range



Bickford Radial Drill.

from 22.5 to 307 revolutions per minute as shown in the accompanying table, in which it will be noticed that suitable speeds are provided for drilling all diameters advancing by 16ths from 7-16 to 7-8 inclusive, 8ths from 7-8 to 2¼ inclusive, 4ths from 2¼ to 3½ inclusive.

This large number of speed changes adapt the machine to metals of all degrees of hardness as the gradation is so slight it is never necessary to run the spindle at a speed much under the limit of endurance of the drill.

The speeds are obtained by means of two levers, one of which is located on the head and controls the three back-gear speeds while the other projects from the speed box located on the base and controls the eight speeds furnished by that mechanism. Of these 24 speeds only one varies from the theoretically correct by so much as 3.11 feet per minute, and as each and every speed is instantly available and is said to have ample power behind it for drilling from the solid the diameters of holes given in the table, it appears as if the builders had met every requisite of the most exacting operator.

The speed box is patterned after the one brought out by the same company the forepart of last year, a description of which appears at page 361 of our issue of September 14, 1905. The eight speeds which it furnishes are obtained from twelve gears, only three of which are in service at a time, whereby wear is reduced to a minimum. So far as appearance and the positiveness of its speeds are concerned, the mechanism may be said to belong to the tumbler gear variety of speed-change device, but inasmuch as the maximum difference in the periphery speed of its gears is confined to the comparatively narrow limit of 2 to 1, such shock as occurs at the moment of changing from one speed to another is nearly or wholly absorbed by the driving belt.

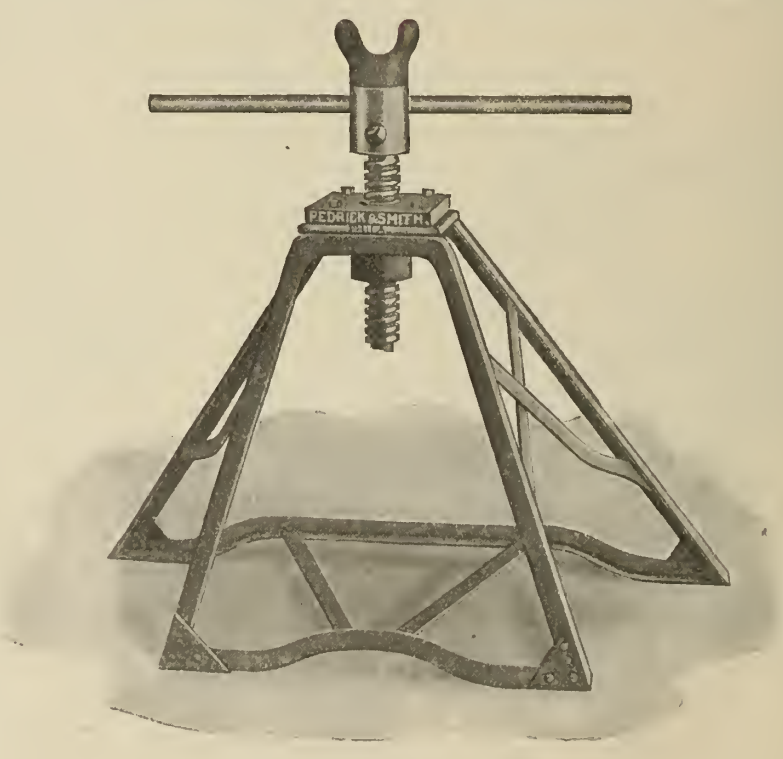
The tapping mechanism is located on the head and permits the backing out of taps at any speed with which the machine is provided regardless of the speed used in driving them in. It is fitted with a friction clutch operated by a lever, the handle of which extends around under the arm within convenient reach of the operator and is used for starting, stopping and reversing the spindle.

The depth gauge answers a double purpose; besides enabling the operator to read all depths from zero, which does away with the usual delays concomitant to scaling or calipering, it supplies a convenient means for setting the automatic trip, the graduations showing exactly where each dog should be located in order to disengage the feed.

The automatic trip operates at as many different points as there are depths to be drilled at one setting of the work; in addition, it leaves the spindle free, after any intermediate tripping, to be advanced, or raised and advanced, or traversed its full length without disturbing the setting of the dogs; it also throws out the feed when the spindle reaches its limit of movement.

STEEL SCREW CAPSTAN CABLE JACK.

The accompanying illustration shows a new style of structural steel screw capstan cable jack, designed and built by



Machine Screw Capstan Cable Jack.

Pedrick & Smith, Germantown, Philadelphia, Pa. It is specially designed for telephone and electric companies and the illustration explains itself.

ABOUT CATALOGUES

By mentioning Canadian Machinery to show that you are in the trade, a copy of any of these catalogues will be sent by the firm whose address is given.

Edward Van Winkle, Consulting Engineer and Attorney at Patent Law, New York, issues a dainty little booklet devoted to engineering and patents, showing the author's connection with these fields.

Air Compressors. — A catalogue devoted to a slight extent to a history of air compressors, but in the main to a list of the users of air compressors manufactured by the Chicago Pneumatic Tool Co., Chicago. 30 pages, 4 by 9.

Educational and Industrial Efficiency. —Report of Albert H. Leake to the Minister of Education on recent development in the schools of the Eastern States. It is issued as an appendix to the Report of Education, and contains some interesting matter on subject of technical education in actual practice ..

The Silent Partner. — No. 7 of the interesting little house organ issued by the Globe Machine & Stamping Co., Cleveland. While containing some advertising matter for the company the book contains many thoughts for the busy man. Everyone should have a copy of this fine little publication. 16 pages, 4 by 7.

Telephone Exchanges. — Private branch telephone exchanges are described and illustrated in the catalogue of the Stromberg-Carlson Telephone Mfg.Co., Rochester, N.Y. This catalogue describes the various apparatus and equipment, as well as the exchanges complete, in an interesting manner. 42 pages, 6¾ by 9¼.

Telephone Catalogues. [illegible] catalogues issued by the Stromberg-Carlson Co., Rochester, N.Y. One of these describes the making of a cable, another how the telephone helped the farmer. Mine telephones are described in a little book entitled Mine-A-Phones, which is devoted to the use of telephones in mines.

American Turret Lathes.—The sheet from the Gisholt Machine Co., Madison, Wis., illustrating and describing the 24-27 semi-automatic turret lathe, formerly made by the American Turret Lathe Mfg. Co., which company the Gisholt Machine Co. bought out. There is also illustrated and described their 24-32 semi-automatic gap turret lathe.

Steel Pressure Blowers.—Bulletin No. 134 in the Sturtevant Engineering Series has just been issued by the B. F. Sturtevant Co., Hyde Park, Mass. It is entitled "Steel Pressure Blowers" and relates to high pressure types of fan blowers for foundry and similar uses. It contains a valuable table of fan capacities for various size foundry cupolas.

Lubricators, Oil Cups, Etc.— The Michigan Lubricator Co., of Detroit, has just issued a catalogue of 108 pages, illustrating and describing their very complete line of lubricators, oil cups, oil pumps, grease cups, and other trimmings for steam engines, gas and gasoline engines, air compressors, boilers, etc. This handsome book will be mailed free of charge to anyone interested.

Inspection Bureau. — The firm of Plews & Trimingham, of Montreal, have undertaken and already well established the formation of an electrical Lux. An interesting little booklet described as a miniature magazine of light literature, devoted to short stories with morals showing the progress made in modern lighting, culminating in the Nernst lamp manufactured by the Nernst Lamp Co., Pittsburg, Pa.

P. D. Dods & Co. —The 112 pages of this cloth-bound catalogue contain a wealth of information regarding Island City paints and varnishes. The lines covered in their manufacture include every variety used industrially. Of particular interest to readers of this paper is the line of machine paints comprising 6 colors. These are made in paste form and can be used as a filler applied with a knife or thinned with turpentine and brushed on.

Clay Working Machinery. — Catalogue No. 50 of the American Clay Machinery Co., Bucyrus, Ohio. A handsome cloth-bound book, profusely illustrated and well printed, describes the various machines manufactured by this company. The machines manufactured include a full line of brick making machinery, terra cotta lumber, clay conduit, sewer pipe presses and all machinery accessories for the running of these plants. 227 pages, 8½ by 11.

Friction Clutches.—David Bridge & Co., engineers and millwrights, Castleton Iron Works, Castleton, Manchester, Eng., have issued a cloth-bound catalogue describing friction clutches, shafting, gearing and hauling installations. The catalogue is well illustrated and contains various tables of sizes as well as useful information regarding the belt phylosophy transmitted by belts and shafting and equivalents of millimetres in inches. 199 pages, 5 by 7½.

Wooden Stave Piping. — The Pacific Coast Pipe Co., of Vancouver, issue a catalogue describing wooden stave pressure and conduit pipe as manufactured by them. The various lines include all sizes of wooden pipe from 3 inches to 5 feet, for both low and high pressure water works mains. Besides being a catalogue of this firm's output showing the advantage of wooden pipe, this book devotes about 20 pages to giving valuable data on hydraulic. 64 pages, 5 by 8.

Centrifugal Blowers.—Bulletin No. 133, recently issued in the Sturtevant Engineering Series, published by the B. F. Sturtevant Co., Boston, Mass., is a pamphlet of sixteen pages. This bulletin is designed to illustrate from actual photographs Sturtevant centrifugal gas blowers and exhausters installed in a few of the best and largest gas plants in the country. It contains a valuable table showing the various sizes and capacities of blowers and exhausters designed for gas plant work.

Taps, Dies and Screw Plates.—The Canadian Tap & Die Co., Limited, Galt, have just issued a handsome catalogue illustrating their various lines of manufacture. The trade name of these goods is "Little Giant," and includes screw plates, taps, dies and collets, adjustable tap wrenches, machinists' hand taps, machine nut taps, as well as various other kinds. Some valuable information regarding the United States v. Standard and Whitworth Standard Threads, is given, besides a table of decimal equivalents. This catalogue should be in the hands of all machinists and dealers. Size, 5 by 7½. 50 pages.

Machinery and Tools. — One of the finest catalogues that has yet been received at this office is to hand from Patterson, Gottfried & Hunter, Limited, manufacturers, importers and jobbers of machinery, metals, hardware, tools and supplies, New York City. It is bound in a Moorehouse catalogue cover, the catalogue being in bulletin style. A splendid feature is the insertion of cross section note paper between the different bulletins. An index at the back refers the reader to any particular machine or tool required, which may be found with little trouble. Besides various machine tools and wrenches, various styles of pulleys and hangers and countershafts are described. Grinding machinery and supplies are also a feature of this catalogue, and considerable space is devoted to engineering supplies. This catalogue should be a valuable acquisition to the files of any manufacturer or dealer in these lines. 715 pages, 7½ by 11

Industrial Progress

CANADIAN MACHINERY AND MANUFACTURING NEWS would be pleased to receive from any authoritative source industrial news of any sort, the formation or incorporation of companies, establishment or enlargement of mills, factories or foundries, railway or mining news, etc. All such correspondence will be treated as confidential when desired

T. Prefontaine will erect a sash and door factory at Montreal.

The Montreal Steel Co. will increase their capital by $500.000.

The Sydney Cement Co., Sydney, C.B., will build a large plant.

The Defiance Iron Works, Chatham, will be greatly enlarged.

Thos. M. Ruston, Brantford, Ont., will erect a planing mill at that place.

The assets of the Imperial Foundry Co., Ottawa, were sold on Oct. 16.

The Moose Jaw Carriage Works Co. is erecting premises in Moose Jaw.

The Cape Breton Foundry Co. will establish a foundry at Sydney, C.B.

Portage La Prairie will endeavor to secure electrieal power from Winnipeg.

The Berlin Rubber Co., Berlin, Ont., will establish a branch at Calgary, Alta.

The Dominion Steam Heating Co. propose to erect a large plant at Galt, Ont.

The Polson Iron Works, Toronto, will extend their plant at a cost of $100,000.

J. I. MacCracken, of Ottawa, will erect an iron clad foundry at that city.

The Borland Carriage Co., Stratford, purpose making a large addition to their factory.

The Sawyer-Massey Co., Hamilton, will increase their plant at a cost of $30,000.

Winnipeg's building permits for 1906, up to October 16th, amounted to $11,366,700.

The Alberta Biscuit Co. will erect a factory at Calgary, Alta., to cost about $55,000.

The Sutherland Rifle Sight Company will erect a $20,000 factory at Westville, N.S.

The Northern Brass Company, of Winnipeg, will erect a new building to cost about $25,000.

A by-law dealing with the new $300,000 foundry proposition will be voted on at Berlin, Ont.

The Moose Mountain Lumber & Hardware Co. are erecting new premises in Kisbey, Sask.

The Seaman Kent Co., of Meaford and Toronto, will erect a factory at Winnipeg, Man.

The Toronto Railway Company will erect an electrie sub-station to cost about $10,000.

The Cape Breton Foundry Company will commence the erection of its plant at Sydney, N.S.

The Cockshut Plow Company, Winnipeg, will add a three-storey addition to their warehouse.

H. R. McLellan and others, of Sydney, C.B., have taken over the Mowry Safety Nut Co.

A new Industrial School to be erected near Cranbrook will cost between $30,000 and $40,000.

The Vulcan Iron Works, of New Westminster, B.C., are erecting a large addition to their plant.

The Canadian Bridge Co., of Walkerville, Ont., are building extensive additions to their shops.

The Sherwin-Williams Paint Company have started work on a $40,000 warehouse at Winnipeg.

Improvements amounting to $6,000 have been made to the Ham & Nott factory in Brantford.

It is rumored in Brantford that the Grand Trunk will remove its Stratford shops to that city.

Wm. Neilson, will erect a factory and stable on Gladstone avenue, Toronto, to cost about $15,000.

Cowan & Company, of Galt, Ont., are making extensive additions and improvements to their shops.

A Vancouver syndicate will build a large hotel on property adjoining Stanley Park, Vancouver.

The Quebec Government have completed plans for a new jail in Montreal to cost about $1,000,000.

Work on the new premises of the Dominion Pipe Co., in New Westminster, B.C., has commenced.

The Peterborough Shovel Co. will erect an addition 40 x 115 feet to meet their growing business.

The Maritime Railway and Power Company are erecting a new power house at Chigneeto, N.B.

The Royal Alexandra Theatre, now under construction in Toronto, will cost $150,000 when completed.

The Chapman Double Ball Bearing Company are erecting a new factory on Sorauren avenue, Toronto.

The Montreal Street Railway is considering an inerease in its capital from $7,000,000 to $9,000,000.

The Standard Gas Holder & Boiler Construction Co., of Belleville, Ont., have obtained a charter.

The C.P.R. will erect a new building at Moose Jaw, Sask., to supply acetelyne gas for passenger coaches.

The Kakabeka power plant has been opened, placing at the disposal of Fort William 12,500 horse-power.

A new mica factory affording employment to 400 girls, will be established at the Chaudiere Falls, Ottawa.

The planing mill of John Arbuthnot & Co., Fort Rouge, has been destroyed by fire, causing a loss of $25,000.

When the new electric light plant is installed at Calgary, Alta., it will cost in the neighborhood of $100,000.

The Oliver Motor Car Company, recently formed to manufacture the Oliver traekless car, has located in Sarnia.

The Tudhope Carriage Mfg. Co., of Orillia, have bought land in Edmonton on which to erect a branch factory.

Welland has passed a by-law furnishing sites and sewerage to the Canada Forge Co. and the Supreme Heating Co.

The Strathcona Radial Tramway Co. are seeking franchise to build an electric railway between Strathcona and Edmonton.

Contracts will soon be let for the work in connection with the erection of the Collegiate Institute at Brandon, Man.

The Acadia Sugar Refining Company, of Moncton, will double the capacity of the Moncton barrel factory, Moncton, N.B.

W. E. Buckingham, of Guelph, representing Michigan capitalists, contemplates starting a paper mill in Toronto.

A saw mill of a daily capacity of seventy-five thousand feet is to be erected by American capitalists on Craeroft Island.

The Canadian Paeific Railway will erect a skyscraper on the northwest corner of King and James streets, Hamilton.

Hastings has voted to give the Peterborough Boiler & Radiator Co. a bonus of $5,000 and exemption from taxes for ten years.

The Manufacturers' Gas Co. have struck another gusher near Selkirk, Ont., the flow is said to exceed 1,500,000 feet per day.

The Canadian Northern Railway Company will erect shops at Montreal and at Fort Rouge, Manitoba, to cost about $1,000,000.

The Western Canada Coal & Cement Company, which is now preparing to operate in Kananaskis, Alta., will locate in Calgary.

Daniel O'Connor and W. A. Maus, representing Peterboro capitalists, may loeate a rolled steel plate mill at St. Catharines.

The Meisel Manufacturing Company and the Port Huron Engine & Thresher Company are about to erect factories in Port Arthur.

The Canadian Iron & Foundry Company, of Fort William, are about to

erect a large foundry. J. R. Duncan will be the manager.

Messrs. Mason, Sturgeon and Davidson of Peterboro, have purchased land in Hastings, Ont., on which to erect a radiator factory.

H. F. Anderson & Co. wholesale implement dealers, of Winnipeg, are making arrangements to open a branch warehouse in Regina.

The Dominion Iron & Steel Co. turned out 1,020 tons of steel rails last Saturday, breaking all records for a 24-hour production.

A Canadian branch of the Kendel Bell Co., of St. Louis, will be located in Toronto. They will employ about twenty-five hands.

Canadian Westinghouse, Hamilton, are installing in their plant three jib cranes, the product of the Smart-Turner Machine Co., Hamilton.

The Shipway Iron, Bell & Wire Manufacturing Co. will shortly make application for a charter, and will establish works in Niagara Falls.

Toronto's building permits up to October 23 represent a value of $11,000,000. The total for twelve months last year amounted to $10,337,000.

The Hart Parr Gasoline Co., St. Charles, Iowa, are considering the erection of a plant in Kenora, Ont., for the manufacture of their product.

The boring for natural gas at Calgary has resulted in the discovery of a pocket of gas at 760 feet, but the pressure is very slight and not of value as yet.

Port Colborne has carried a by-law granting exemption from taxes to the Great Lakes Portland Cement Co. and the Canadian Portland Cement Co.

The Smiths Falls Malleable Castings Company intend to duplicate their present plant, having bought about 12 acres of land to allow for the enlargement.

The new shops of the Perth Bolt & Forging Co., Limited, Perth, Ont., are rapidly being completed. And the company hopes to be running in December.

The Sanderson Mfg. Co., Sydney, N. S., have been incorporated with a capital stock of $45,000. They will manufacture roofing material, tar paper, etc.

A wealthy syndicate is being formed in Victoria and Vancouver to build a brick factory and exploit marble and sandstone deposits in British Columbia.

Symmes & Co., Niagara Falls, have been awarded the contract for supplying natural gas to Chatham. The gas will be brought from the Tilbury fields.

The Canadian Pacific Railway Co. will build another big extension to the Angus shops at Montreal to cost about $70,000. The new building will be 672 x 100 feet.

Heap's saw mill, Cedar Grove, near Vancouver, B.C., has been completely destroyed by fire. The loss is estimated at $200,000, partially covered by insurance.

The Central Heating Co., Hamilton, have amalgamated with the Dominion Heating Co. of the same city. The company will not be ready to do business this winter.

J. M. Fleming, of Ottawa, and others, purpose starting a factory in Iroquois, Ont., for the manufacture of certain patents in connection with machine shops.

The Toronto-Niagara Power Co. have purchased a block of land on Dufferin street, Toronto, and intend erecting their shops and transforming station on the site.

H. W. Sanders, of Sydney, N.S., representing eastern capital interested in iron and steel, is in the west looking for a location for crucible steel and stove works.

The Maritime Coal Co. is developing electric power for Amherst, Moncton, and other eastern cities. The equipment is being installed by the Canadian Westinghouse Co.

The Detroit Trolley Wheel & Electric Equipment Co., have purchased the Ward factory building in Leamington, Ont., and will manufacture automobiles, brass goods, tools, etc.

The Smith's Falls Malleable Castings Co., of which W. H. Frost is the head, has purchased the Rideau Malleable & Foundry Co., and the two concerns will be amalgamated.

The Stanley Smelting Works, whose mines and plant are located at Bannockburn, Ont., are disposing of stock worth $500,000 to increase the producing capacity of their works.

The Phillip Carey Mfg. Co., Lockland, Ohio, is preparing to erect an asbestos plant at Montreal. It cost $15,000 in duty last year to bring this company's goods into Canada.

The Roxton Mill & Chair Manufacturing Co., Roxton Falls, Que., has dissolved. J. H. Poirier, J. A. Beaudry, Louis Plouffe and Alfred Langevin have taken over the business.

The Canadian Westinghouse Co., of Hamilton, Ont, have secured a quarter of a million dollar contract for electrical machinery and equipment for the Montreal Power & Light Co.

Work has been commenced on the Canadian Iron & Foundry Co's foundry at Fort William, Ont. Railway car wheels, castings and cast iron water and gas pipes, will be manufactured.

The Bank of Nova Scotia has purchased the corner of Portage avenue and Garry street, opposite the Free Press, Winnipeg, for $125,000, and will erect a $200,000 office building.

Arrangements have practically been completed by Henry Coates, of Coates Bros., the English thread manufacturers, to establish a carpet factory at Peterboro with head offices in Toronto.

Fire at Summerside, P.E.I., on Oct. 10 caused loss to the amount of $200,000, with insurance of $50,000. The electric light station and the railway sheds were among the buildings burned.

F. H. Clergue's type of ore-roasting furnace is alleged to be an infringement on the patent furnace of Francis Herreshoff, of New York, chemist, and brother of the famous yacht designers.

The Morgan Cement Works, Montreal, Que., have been purchased by a syndicate of New York and Montreal capitalists who will establish a plant with a capacity of 1,200,000 barrels annually.

The Town of Carberry, Man., is installing in their pumping station a compound duplex pumping engine. The latter is at present being built in the works of the Smart-Turner Machine Co., Hamilton.

Extensions amounting to $175,000 to the plant of the American Locomotive & Machine Co., at Longue Pointe, Que., will add 500 men to the works, and will give a capacity of five locomotives per week.

The Dominion Iron & Steel Co. during August produced 4,947 tons of wire rods, 17,840 tons of steel rails, 25,079 tons of steel ingots, and 20,844 tons of pig iron. The bounty earned would be $70,000.

The Lac Du Bonnet power plant of the Winnipeg Electric Co. has been shut down for want of water and it is feared the plant will be a total failure. It was installed this Summer at a cost of $4,250,000.

For the first time since the commencement of the decline of the bicycle business, the annual report of the Canada Cycle & Motor Company shows an increase in sales over those of the previous year.

Automatic feed pumps and receivers are being supplied by the Smart-Turner Machine Co., Hamilton, to McMaster University, Toronto, the Foster Pottery Co., Hamilton, and John Bertram & Sons, Dundas, Ont.

The Monarch Lumber Co., Savona, B.C., are erecting a new saw mill and planing mill. The saw mill building is 30x144 feet, and the planing mill building 30x60 feet. The capacity of the mill will be 40,000 feet per day.

The first cargo of lumber to leave British Columbia ports for Valparaiso, owing to the recent earthquake in the South American port, is now being loaded in the British ship Curzon, at the Fraser River Saw Mills.

The Hall Elevator & Grain Co., of Vancouver, are letting contracts for a flour mill with a capacity of 500 barrels per day. It is the intention of this company to develop the grain and flour business of the Orient from Vancouver.

The Polson Iron Works, Toronto, are planning a large addition to their works. The proposed site is 132x660 feet. The new building is for casting purposes, and would mean the employment of 100 more men by the company.

Commissioner of Industries Thompson has been successful in securing another industry for Toronto. The United Zinc Co., of Boston, will establish works on Adelaide street, near York street, and will employ about twenty men.

The Maritime Coal Co. will establish an electrical plant at their coal mines near Amherst, N.S. The electric current will be carried to Amherst on a high tension wire and in a short time will be carried on to Moncton a distance of 50 miles.

The International Portland Cement Co., of Hull, will double its present

plant in that city, giving it a capacity of 4,000 barrels daily. They are also completing a mill in Exshaw, Alta., which will make their total daily output 6,500 barrels.

By June, 1907, the Canadian Iron & Foundry Co., Fort William, expect to be employing over 200 men in the manufacture of railway car wheels and castings. Besides the foundry the plans include a machine shop, where marine engines will be built.

Extensions under way at the plant of the American Locomotive & Machine Company at Longue Pointe, Que., will cost $175,000, and will enlarge the works to provide for an additional force of 500 men. The capacity will then be five locomotives per week.

A meeting of shareholders has been called for Oct. 23 to consider the proposed amalgamation of the Robb Engineering Co., of Amherst, N.S., and the Robb, Mumford Boiler Co., of South Framingham, Mass. D. W. Robb is managing director of both concerns.

The Canada Forge Co. have been incorpoarted with a capital of $100,000 to manufacture steel and iron forgings. The directors are: T. J. Dillon, J. T. Dillon, C. Burgess, E. O. Emerson and J. L. Emerson, all of Titusville, Penn. The head office will be at Welland, Ont.

The Kindel Bed Co. have been incorporated with a capital of $15,000 to carry on their usual business. The directors are: C. J. Kindel, J. M. Kindel, D. Robertson, R. Coopersmith, all of New York, and J. W. Abbott, of Toronto. The head office will be at Toronto.

I. E. Shantz & Company's foundry, of Berlin, Ont., was in danger of being destroyed by fire on Wednesday last, but the efforts of the fire department prevented the flames from spreading to the main building. The molding shop suffered loss of $2,000, covered by insurance.

Work is now progressing on the establishment of a large plant for the treatment of ores mined at the Bogart pyrite property near Tweed. Sixty men are now at work and the number will be increased to 200 shortly. A C.P.R. siding is being constructed to the mine.

Whalen & Boweman, who have signed an agreement with the Town of Fort William to build a $50,000 dry dock and ship-repairing yard, are said to be contemplating the establishment there of a $250,000 ship-building plant instead of merely carrying out their first intention.

The annual statement of the Lake Superior Corporation for the year ending June 30, 1906, shows that the company has during that time earned 1 per cent. on its total capital of $10,000,000, which is considered to be a very favorable report when compared with previous years.

Bisset & Loucks, Winnipeg agents for the Caledonian Iron Works, of Montreal, have been awarded the contract to supply the city of Winnipeg with two turbine pumps at a cost of $21,063. The first pump is to be delivered within four months and the second not more than two weeks later.

A despatch from Amherst states that negotiations are under way that will look to the amalgamation of the Robb Engineering Co., of Amherst, and the Robb-Mumford Boiler Company, of South Framingham, Mass. D. W. Robb, of Amherst, is managing director of both companies.

The Canadian Northern Railway Company are asking Toronto for land in Ashbridge's Bay as a site for blast furnaces, which they intend to erect in the near future in conjunction with the entrance of their railway into the city. The company require at least fifty acres of land for their enterprise.

The Lehigh Portland Cement Co. have been incorporated with a capital of $1,000,000 as manufacturers and dealers in cement, lime, whitening and builders' supplies. The directors are: H. C. Tryler, E. M Young, C. A. Matcham, and G. G. Sykes, all of Allentown, Penn. The head office will be at Thurlow, Ont.

The Canada Foundry Co., of Toronto, has been awarded a large portion of a 20,000-ton contract for structural steel by the C.P.R. The steel is for bridges in Ontario. The Dominion Bridge Co. also secured a part of the contract. The Canada Foundry Co. bested bids of a number of large American companies.

Plans have been prepared and ground will soon be broken for the new radiator plant to be established in Toronto by the Warden King and Cluff Bros.' interests. A splendid site has been secured in the northwestern part of the city with good railway shipping facilities, and by next Fall the plant will be in running order.

Messrs. R. Arbuthnot and John C. Marvin, of Winnipeg, are now owners of the Nanaimo Lumber Co.'s plant at the coal city. The deal was put through this week, the purchase price being $125,000 and over. Mr. Arbuthnot, one of the purchasers, has large lumber interests in Manitoba, where he has a retail yard in Winnipeg.

The first electric or trolley locomotives to be used on the Canadian Pacific, or in Canada, will be installed in the Fort William switching yards of the C.P.R. Mr. Cross, assistant to the vice-president, stated that as soon as Kakabeka Falls power plant is completed electricity will be used for motive power in the Fort William yards.

There is at present great rivalry between the various electrical companies at Welland to supply electric power to the industries located there, the Welland Iron Works, M. Beatty & Son, the Robertson Machine Co., Heslop's Roller Mills, Plymouth Cordage Co., Ontario Iron & Steel Co., Automobile Co., Supreme Heater Co., and the Forging Co.

W. I. Kemp, Newark Valley, N.Y., proposes to reopen the Kemp Manure spreading factory in Stratford, as an agricultural machinery factory. The city council is asked to submit a by-law to the ratepayers to guarantee the bonds of the company for the sum of $25,000, repayable in 20 years, and to fix the business assessment at the sum of $25,000 for ten years. The factory was built five years ago at a cost of $36,000.

At Portage la Prairie on Sept. 20, 54,674 tons of eighty-pound steel rails, valued at $1,500,000, were officially entered into Canada from Buffalo. The steel is for use on the Grand Trunk Pacific line, and will be brought to the yards they have established here for distribution. This is said to be the largest single entry ever passed in the west.

The Century Telephone Construction Co. are locating their Canadian factory at 53-59 Adelaide street west, Toronto, where everything used in construction of independent telephone systems will be manufactured. They are at present in the market for cross-arms, toppins, side blocks, glass insulators, and galvanized telephone hardware, and insulated hardware in carload lots.

Dartmouth, N.S., has awarded the contract to the Canadian Fairbanks Co., Limited, for their complete lighting plant for the town, consisting of a 150 h.p. Fairbanks-Morse suction gas producer plant and a 10 k.w. alternator to be belt driven. The Canadian Fairbanks Co. will make the complete installation consisting of the producer engine, alternator, switchboard, etc.

The Montreal Steel Works are increasing their capital from $1,500,000 to $2,000,000. Half of this increased amount, $250,000, will be spent during 1907 in increasing their plant. Arrangements will be made to turn out manganese steel castings in considerable quantities, a special section of the foundry being provided for this purpose. The machine shop and assembling floors will also be largely increased.

The Canadian Westinghouse Co. claim to have abolished the fire engine with the Westinghouse-McDougal turbine pumps, now being installed by the City of Toronto. They have a capacity of 5,000,000 gallons of water every 24 hours, are always ready to work—the steam is always up—and when fire occurs it is only necessary to couple the hose to the fire plug and the water pours out.

A remarkable showing was made this year in municipal ownership by the Port Arthur council. Although a great deal of public work was done, incidental to the growing municipality, the earnings of the various franchises have been so great that the council is able to strike a general rate of nine mills on the dollar. The net earnings of the street railway, light plants, telephone and water system were sufficient to take care of the total debenture debt.

Thomas S. Baker, general manager of the Ontario Steel Ware, Limited, Toronto, has returned from a trip through the Eastern States. While away he visited the largest enamelware plants in order to secure the latest ideas in kitchen ware. Work on the enlargement of their plant on Brock avenue, Toronto, is rapidly proceeding and the company will in another month be able to fill large orders for their new wares.

The Grand Trunk Railway have placed an order with the Locomotive & Machine Company of Montreal for fifty-five new

Richmond compound consolidation engines, to be in service on different divisions of the system before January 1 next. They are powerful machines, as large as any on the continent, except those used in the heavy mountain service, and are 40,000 pounds heavier than the compound freight engines that have been used as standard on the Grand Trunk in the past.

A soap works, a pipe works, and a glass works are the industries to be established in New Westminster very soon, according to report. The soap works is to be built by a capitalist from the east who visited the Coast during the recent exhibition. The pipe works is being founded by local men backed by foreign enterprise. The glass concern may be a reality very soon, as the deal for the property, including buildings already erected, may be completed at any moment.

Good progress is being made in the erection of the addition to the foundry department of the Nelson Iron Works, Nelson, B.C. When the building is completed it will give 5,000 square feet more floor space. Messrs. Isaac & Hinton will increase the capacity of the plant with a new 60-inch cupola, which, with the 30 and 48 inch cupolas now in operation will give a combined capacity for the casting of any size up to eight and ten ton, sufficiently large for any work that may be needed in that section of the province.

The Silsby Lumber Co., of West Burke, Vt., are putting up a large saw mill on their extensive limits recently acquired near St. George de Beauce, Que. The steam plant, consisting of a 350 h.p. duplex saw mill engine, three 125 h.p. high pressure tubular boilers for Dutch oven setting, 100 h.p. feed water heater and 7½x5½x10 duplex boiler feed pump, is being furnished complete by the Jenckes Machine Co., Limited, the boilers being built at their St. Catharines works, and the balance of the plant at Sherbrooke.

J. W. Lyon, of Guelph, secretary-treasurer of the Western Ontario Municipalities Power Association, has a flattering report to make in reference to the canvas made to ascertain the amount of power required by the various places in the Toronto district. The following are the applications so far sent in for power: Toronto, 30,000 horse-power; London, 10,000; Woodstock, 1,200; Paris, 1,000; Galt, 2,500; Preston, 800; Hespeler, 760; Berlin, 3,000; Guelph, 2,000; Waterloo, 900; Stratford, 2,000, and Brantford, 3,000.

The Montreal Smelting & Refining Co. which is building an extensive customs smelter at Trout Lake, near North Bay, Ont., for treatment of Cobalt ores, has closed a contract with the Jenckes Machine Co., Limited, Toronto, for the complete steam plant which will be required. This will consist of four 150 h.p. high pressure tubular boilers, two 250 h.p. heavy duty Corliss engines with feed water heater and boiler feed pump. The boilers are being built at the St. Catharines works of the Jenckes Company and the balance at Sherbrooke.

At the annual meeting of the Quebec Bridge Co., held at Quebec recently, the engineers' report was submitted showing the substantial progress in the work of building the new bridge across the St. Lawrence. On the south side the erection to date extends from the shore abutment to a distance of 900 feet, the quantity of metal put in place being 11,300 tons. In addition to this there are 20,700 tons manufactured and in storage. The manufacture of metal for the bridge is expected to be finished by May next. Hon. S. N. Parent was re-elected president.

While the reports from the subsidiary companies of the United States Steel Corporation have not yet been received at the headquarters of the corporation, steel manufacturers estimate the earnings for the quarter ended September 30 at between $39,000,000 and $40,000,000. One steel representative figures they will be around $39,500,000, or about $600,000 lower than they were in the second quarter of the year. The slight falling off in the third quarter is due, as generally known, to the hot weather, which always retards the operations of the steel mills and furnaces.

The Canada Forge Co. have begun the construction of their buildings at Welland, the contractors being the Welland Construction Co., who also have the construction for the buildings for the Ontario Iron & Steel Co., having been working on them for some time. The Forge Co. will construct two buildings about 50 x 100 feet each, to be completed by November 15; other buildings will be added. They will begin manufacturing early in January. Electrical power will be installed at once, using about 75 horsepower. The capital of the company is $100,000.

Owing to scarcity of water at certain seasons of the year interfering with operations, the Edson Fitch Co., of Etchemin Bridge, Que., a branch of the Diamond Match Co., are installing an auxiliary steam plant, for which the order was recently placed with the Jenckes Machine Co., Limited, of Sherbrooke, Que. It will consist of two 100 h.p. high pressure tubular boilers for Dutch oven setting, 150 h.p. engine, 200 h.p. feed water heater, and 6x4x6 boiler feed pump. The improvements are in charge of Mr. Wright, of Liverpool branch of the Diamond Match Co.

The Ontario Wind Engine & Pump Co., Toronto are about to ship to Cairo, Egypt, two 16ft. airmotor outfits complete with irrigation pumps. This order follows a large one shipped a few weeks ago. It is interesting to note that Canadians are pushing their wares even to the land of the Pharaoh. This company are also making a good exhibit in New Zealand, which will still tend to spread the virtue of Canadian goods. They also received lately an order for a 40ft. "Halladay" windmill (largest size made in wooden wheels) for shipment to Chili, South America, via England.

It is said that the Dominion Iron & Steel Co. have secured a large order from the United States for overhead rails of 125 pounds. They received the sample rail a few days ago. The mill is working now on the G. T. P. contract for 30,000 tons. and it is understood the manufacture of this rail will be begun as soon as this order is finished. The mill is rushed day and night. Very little work is being done in the rod mill of the company, owing to the serious depression in the market. It is stated that strong pressure will be brought to bear upon the Government to increase the duty on wire goods.

The first gasoline traction engine for threshing, plowing and general heavy work, ever built in Canada was turned out of the Dyment Foundry Co's shops at Barrie for its trial trip. The engine weighs four tons and is the invention of J. C. McLachlan, of Toronto, now superintendent of the motor shops. It is equipped with a 40 h.p. double opposed engine and with a gang of ten plows will plow 40 acres a day. The machine is much lighter than a steam engine, and the elimination of the chances of fire is one of the engine's chief recommendations. It will drag a threshing outfit two miles an hour on ordinary roads.

The United States Steel Corporation is forced to the constant expenditure of millions of dollars in order to keep pace with its business. On October 1 the Steel Corporation had, in all, 94 completed furnaces, of which all but seven were in operation. Notwithstanding the fact that it now has practically 97 per cent. of its active blast furnace capacity blowing, it will erect four large blast furnaces in the Pittsburg district at once. Six other furnaces now are in course of erection, four at Gary, Ind., the new $75,000,000 steel town, by the Indiana Steel Co., with a capacity of 600,000 tons, and two at Rankin, Pa., with an annual capacity of about 430,000 tons. All these furnaces will make a specialty of pig iron.

The corporation of Port Arthur, Ont., have placed contracts for an important extension to the municipal hydro-electric plant. The water-wheel portion of the equipment will consist of a pair of 30-inch special Crocker turbines arranged in horizontal steel case, discharging centrally, and developing 1,300 h.p. at 450 revolutions per minute under 85-foot working head, the runners being of bronze. For government there will be a type "C" Woodward water-wheel governor. The contract for the turbines was placed with the Jenckes Machine Co., Limited, Toronto, which company also built the two turbine plants already embraced in the Port Arthur municipal plant. The turbine unit will be direct connected to an Allis-Chalmers-Bullock generator.

Canadian failures for nine months, as reported to Bradstreet's, number 901, involving $6.803,125 of liabilities, a decrease of 11.6 per cent. in number and of 36.2 per cent. in liabilities from a year ago. Failures, assets and liabilities in Canada in nine months for a period of years past follow:

	Number.	Assets.	Liabilities.
1906	901	$2,983,773	$6,803,125
1905.....	1,020	5,162.992	10.676 595
1904.....	832	3,238,256	7,696,688
1903.....	712	2,887,323	6,274,132
1902.....	851	2,759,989	6,300,413
1901.....	1,041	4,160,670	9,376,495
1900.....	1,002	3,017,784	7,441,667
1899.....	975	3,501,274	8 585,901
1898.....	1,091	3,271.772	7,592.510
1897.....	1.501	4,141,860	10.653.212

The Canadian Pacific Railway Co. have placed an order for 2,000 additional freight cars, bringing the total number now under contract at the Angus shops up to 4,000. An order was issued at the same time for thirty-five additional locomotives, which goes to the Montreal Locomotive Works. The decision was also arrived at by the executive to increase the present locomotive output at the Angus shops from 100 to 150 engines per annum. This means that the company will turn out three finished locomotives per week instead of two as they have hitherto done. The total outlay on the new rolling stock equipment that will be delivered to the company and distributed over the system by July next year will be between $7,000,000 and $8,000,000.

Ten years ago the total assets of Canada's chartered banks amounted to only $320,000,000, while to-day they are over $890,000,000. The liabilities ten years ago were $230,000,000, as against $710,000,000 at the present time. The total deposits ten years ago were only $185,000,000, while now they aggregate $607,000,000. The loans and discounts in 1896 were but $222,000,000, while they now aggregate nearly $665,000,000. The paid-up capital ten years ago was $62,200,000, with a rest or reserve fund of 42 per cent. of this amount. Paid-up capital to-day is $93,000,000, and the reserve fund is 70 per cent. on capital. The circulation of bank notes has more than doubled in ten years, while the banks now hold in specie and legal tender nearly $61,000,000, as against $22,000,000 ten years ago.

Four new industrial concerns propose to locate in Goderich shortly, if their propositions receive the approval of the ratepayers. Two will not be voted on at present, but the most important, perhaps, that of the Goderich Wheel Rigs Co., will come up at once, the by-law being published in the local papers this week. Some of the important features are that the authorized capital of the concern will be $250,000, that they will employ by the end of a year at least one hundred hands, and that this is to be the sole Canadian factory of the concern, and a duplicate of the parent plant, the Lloyd Manufacturing Co., Minneapolis, Minn. The goods manufactured will be baby carriages, express wagons, rattan goods — in fact everything of that nature, practically the only manufacturers of these in Canada at present being the Gendron Co., Toronto. They ask the municipality for a loan of $50,000 repayable in twenty equal annual payments, without interest, and the usual privileges.

Cobalt, the New York Commercial says, is a unique mining camp by its remarkable surface showings and in the high grade character of its ores. No where else in this country can one walk on almost solid silver for hundreds of feet, and few, if any, of the world's mines boast the possession of vein matter running away up in the thousands of dollars to the ton. It is to these sensational features that the camp owes its notoriety, and to the same source that one can trace the present boom in Cobalt shares. Few are the mines that have paid from the grass roots, but this is what Cobalt mines have done. From few of the world's mining properties have the owners been able to quarry outright from the surface carloads of such rich ore. Along with these striking developments there has recently occurred an unprecedented rise in the value of the white metal, due to the large demand for coinage purposes in the Orient. Like all boom camps, it says, a large amount of wild-catting may be looked for.

The three largest Montreal steel companies have all plans completed for large additions to their present plants, that will result in the outlay of over $2,000,000 in the next year. The Montreal Steel Company will increase their capital to $2,000,000 by increasing their preferred stock from $700,000 to $1,050,000, and the common stock from $700,000 to $950,000. The company, according to the official announcement, intend to erect a large plant for the manufacture of manganese castings for intersection of street railway and steam railway tracks, and a large power plant and extensions to most of the present works. The plant will be 400 by 300 feet. The Montreal Rolling Mills will erect a large nut and bolt plant, and a large forging mill and new stores department. The Peck Rolling Mills Co. will remove a large portion of their plant from Mill street to the bank of the Lachine Canal, where they intend erecting a large group of mills for the manufacture of nails and smaller kinds of steel. All these companies say they have never been so rushed with orders as at present.

It looks very much as if the C.P.R. were preparing for its campaign of development of Vancouver Island. A survey party is now en route to the west coast of the island, starting from Comox and going across to Alberni Canal. The branch proposed to be built across to Alberni would be only part of the plans of the railway, as an extension of the E. & N. (the island railway now owned by the C.P.R.) from Nanaimo, its present terminus, to Comox is included. The fact that the survey party was sent out just at the time of the visit of President Shaughnessy is considered significant. On the west coast there is considerable development in the vicinity of Alberni Canal, but across the island there will be miles of untrod forest to explore. When the size of Vancouver Island, 250 miles long by 100 broad in some places, is considered, and the facts taken in that it is heavily wooded with magnificent forests of fir and cedar as well as being mountainous in the interior, it will not be surprising that this survey party will have much exploratory work to do, in places where no white man ever yet set foot.

Moving to Hespeler.

The McEachren Heating & Ventilating Co., of Galt, have been granted a loan by the municipality of Hespeler and have already undertaken the erection of large factory buildings in that town. The McEachren Co. has increased in strength very considerably recently and propose carrying on business on a much more extensive scale. By Spring it is anticipated that the new plant in Hespeler will be ready for operation. In the meantime operations will be carried on in their own plant in Galt.

A Large Increase in Business.

An increase in the capital stock of Allis-Chalmers-Bullock, Limited, was agreed upon at the annual meeting, the advance being from $1,200,000 to $2,500,000. Report showed the business had more than doubled during the last year and the number of men working in the shops had been increased from 300 to 600. While Allis-Chalmers-Bullock, Limited, has the right to sell the well known products of the allied companies, Allis-Chalmers Company, Milwaukee, Wis.; Bullock Electric Manufacturing Company, Cincinnati, Ohio; Ingersoll-Sergeant Drill Company, New York, N.Y., and Lidgerwood Manufacturing Company, New York, N.Y., it is the policy of the directors to build the different lines in Canada as soon as the markets warrant it. Though the company has the benefit of the engineering skill of the older companies in the United States, it has its own staff of engineers to superintend construction and modify any of the details which local conditions may require. It will now go thoroughly into the development of two more important lines, hydro-electric machinery and the Christensen air brake.

Allis-Chalmers-Bullock, Limited, is the only company in Canada which manufactures both water turbines and electric generators, and which therefore is thoroughly familiar with the requirements for their successful operation as one unit. The reports of the Ontario Government Hydro-Electric Commission have so stimulated public interest in the subject that, with the present facilities, the company is unable to meet the demand. A portion of the increased capital will therefore be devoted to this work.

The following directors were elected at the meeting: Messrs. Edgar McDougall, W. C. McIntyre, J. W. Pyke, Phelps Johnson, Wm. McMaster, H. J. Fuller, Alex. Pringle and J. A. Milne, of Montreal; W. H. Whiteside and Chas. Allis, of Milwaukee; George Bullock and J. S. Neave, of Cincinnati; E. D. Adams and W. W. Nichols, of New York, and Lloyd Harris, of Brantford. Subsequently, Mr. George Bullock was elected president, and Mr. Edgar McDougall vice-president of the company and chairman of the executive. The directors have had under consideration for some time plans for enlarging the buildings and increasing the equipment and with this increased capital they will be able to go ahead with the contracts for these purposes.

* * *

Sudden Death.

News of the sudden death of Mr. W. T. Jennings in Michigan, an eminent civil engineer of Toronto, came as a shock to the entire engineer fraternity in Canada. Mr. Jennings was one of the best known of Canadian civil engineers, being a past president of the Canadian Society of Civil Engineers. At the time of his death Mr. Jennings was consulting engineer, in which he had a large practice, being chief consulting engineer for the Electrical Development Company and the Toronto-Niagara Power Co. In many instances he had been detained by the Dominion Government to make reports on various engineering enterprises, and was considered one of the most highly qualified men in his line.

New Branch Office.

The Jeffrey Manufacturing Co., engineers, founders and machinists, manufacturers of chain belting, elevating, converting, crushing, screening and power transmission machinery, head office Columbus, O., have opened commodious sales rooms and offices in Montreal, which will be their headquarters for the Dominion. Mr. A. G. Walker, formerly with Williams & Wilson, is in charge of the new business. Mr. Walker was for 15 years with the Williams & Wilson Company, and during these years Williams & Wilson were the agents for the Jeffrey Co., so that the business in all its details has been well mastered by Mr. Walker. Few men in this connection have such an excellent grasp of the machinery and kindred interests in Canada. A stock of standard material such as chain sprockets, buckets, adjustable take-ups, pillow blocks, collars, spiral conveyors, elevator boots, etc. Of any of these estimates, plans, information and prices will be furnished all prospective buyers on application. Twenty-five years experience in these lines enable the firm to furnish labor-saving appliances of the most efficient construction. A large and handsome catalogue with 370 pages has just been received from the printers and will be mailed to those desirous of investigating the lines of the Jeffrey Manufacturing Co.

* * *

Bureau of Testing and Inspection.

The inspection bureau and testing laboratory, recently established by Plews & Trimingham, covers plans, supervisions and specifications as well as tests and investigations. This firm is to be congratulated on their energy in this direction. It is the first time an attempt has been made in Canada to establish such a laboratory, and the effort is bound to meet with the success it merits. The reports of this firm are accepted by the Canadian Fire Underwriters, hence any manufacturer having his apparatus tested and reported favorably upon is sure of its standing and acceptance under all conditions. A large number of firms have already taken up the matter with this company and are having all their various lines of electrical apparatus tested in a thoroughly scientific manner, thus avoiding any possibility of faulty work being sent out. The fact that Canadians have now available an institution of this kind will be of great benefit, particularly to the manufacturing interests. This scheme is assured of success and of a favorable reception at the hands of the Canadian public.

* * *

Collingwood Steel Plant Running.

Men have been at work for several weeks fitting up the Northern Iron & Steel Company's plant at Collingwood, and the president, Major Currie, announced recently that the first bar would be rolled on September 27. An invitation was extended to all Collingwood citizens to be present and three hundred of the leading citizens of the town and surrounding country were present at the mills and witnessed the mill put in operation. The first bar, six by one inch in size, was cut up into souvenirs. The machinery worked to entire satisfaction and the officers of the company received the congratulations of all present. There is a large tonnage on the books for the mills and shipments of finished products commenced this week. The starting of the steel plant will mean a good deal to the wire company, whose plant adjoins. When the steel plant commences furnishing rods to the wire company it will mean a saving in freight to the latter company of over $100 per day. The wire company has been running on orders night and day and is booked up for the remainder of the season.

* * *

Ship Building Industry.

The big 500-foot freighter now under construction at the shipyard, is certainly a wonder for size and strength. Stood on end she would reach as high as a ten-storey building, and to climb to her deck is like going up the winding stairs of the tower at Ottawa. All the framework of this vessel is in position, and the greater portion of the heavy plates also riveted in place. The foundry and machine shops have a large gang busy on the engines for No. 9.

The shipyard is bound to be a money maker. The old conditions have passed away. The company have already a large number of applications for reservation for the Winter months, and it looks as if the dock and yards will be run wide open all Winter with repair work.

Our reporter visited the Northern Iron & Steel Co's works on Monday last, and found this magnificent plant last, and found this magnificent plant The rolling mills will be ready by the end of the month.

About four thousand tons of raw material have already been assembled on the premises, and orders have been booked for the whole of the product manufactured during the first three months.—Collingwood Express.

* * *

New Power Development.

The Maine & New Brunswick Electrical Power Co., which is developing a water power at Aroostook Falls, New Brunswick, has awarded contracts for the necessary equipment. The turbine plant will be built by the Jenckes Machine Co., Limited, Sherbrooke, Que., and will be composed of two 900 h.p. units each consisting of a pair of special 21-inch cylinder gate Crocker turbines, each pair mounted on a cast iron draft tube discharging centrally, set in concrete flume and running 600 h.p.m. under 72-foot head, developing 80 per cent. efficiency at full gate. The turbine runners are cast bronze and the construction throughout is of the most substantial character. One Lombard type "P" water wheel governor will be attached to each unit. A steel penstock 6 feet 6 inches in diameter by 75 feet long conveys the water from forebay to each unit. Each unit will be direct connected to a generator, the order for which was placed with the General Electric Co., Schenectady, New York. The headquarters of the Maine & New Brunswick Power Co. are at Presque Isle, Maine, and the order for the turbine plant was placed in Canada only after the most thorough investigation and comparisons with the product of American turbine makers who were tendering.

Pacific Pipe Co's Progress.

In Eastern Canada the extent of the trade in wooden pipe in British Columbia is hardly realized, and the enormous business being done in this direction within the short time from the organization gives some idea of the scope for future business. The Pacific Pipe Co., of Vancouver, have just completed the manufacture of 10,000 feet of 18-inch pipe for Fort William, Ont., as well as ten miles of 8-inch pipe for the same municipality. The company are now engaged on an order of 10½ miles of pipe to stand a pressure of from 300 to 500 feet head for the Canadian Pacific Railway in Alberta. This is the biggest pipe contract ever given in Canada. They are also working on an order of 6,500,000 of 24-inch pipe for the White Valley Irrigation & Power Co., at Vernon, B.C., as well as an order of about two miles of 6-inch pipe for Port Arthur. Besides these the firm has just completed installing waterworks systems for Cardston and Claresholm.

* * *

Demand for Wooden Pipe.

The Canadian Pipe Co., of Vancouver, have supplied half a million feet of wooden pipe to different points in Canada. The City of Vancouver is installing 3 miles of 36-inch continuous stave pipe built by this company. The pressure from a head of 195 feet is 80 lbs. per square inch. This is for the intake of the city water supply, it having been decided to go three miles further up the mountains to get a better pressure.

* * *

Smelting Ore in Toronto.

It is anticipated in the near future that Moose Mountain ore will be smelted at Toronto, where a proposition has been made for the utilization of a large tract of land at Ashbridge's Bay as a site for blast furnace and steel works. Mackenzie & Mann interests are at the bottom of this to afford an outlet for the extensive ores at Moose Mountain, in Northern Ontario. A furnace of 200 tons daily capacity is considered and it is expected that this will be in operation two years hence. The ore haul will be slightly less than 300 miles, and it is believed Toronto is ideally situated for this on account of its boat transportation facilities both east and west.

* * *

Another Cement Industry.

A syndicate of Montreal and New York capitalists who were forming a strong combine for the manufacture of cement, have purchased the Morgan Cement Works, situated on the outskirts of Montreal. It is proposed to immediately break ground for a plant which will have an initial yearly capacity of 600,000 barrels, with proposed extensions to make the output eventually 1,200,000 barrels. It is proposed to go ahead with the works and have them in running order.

* * *

Removal of Sales Office.

The Ontario sales office of the Jenckes Machine Co., Limited, has been moved from 12 Lawlor building, Toronto, to St. Catharines, Ont., where it will in future be operated in conjunction with the extensive branch works of the company there. Mr. W. G. Chater, as formerly, will be in charge.

"Galvanizing" With Zinc Aluminium Alloy.

In order to get a "galvanizing" bath that shall be quite liquid and yield a brighter surface than is attainable by the use of zinc alone, Guhrs uses an alloy composed of about one-half of one per cent. of aluminium, and one-fifth per cent. of bismuth with the zinc. In order to get this alloy in proper state of diffusion it is necessary to melt the aluminium at the same time with the zinc; the bismuth can be melted in at the same time if desired. It is claimed that simultaneous melting of the zinc and the aluminium prevents the formation of oxide and of hard dross. In order to effect this desirable simultaneous melting of these two metals, it is best to prepare beforehand an alloy of zinc and aluminium, or of these with bismuth, in stronger proportions of aluminium than is desired in the bath—for instance, 20 parts of aluminium and the same of zinc, with five of bismuth, well stirred while melting. This "mix" is to be melted with the rest of the zinc, in such proportions as will give to the resulting melted mass the requisite proportions for the bath.

A higher percentage of aluminium can be used than one-half (one two-hundredths of the entire weight), but it effects no improvement above that brought about by the use of the smaller quantity. The bismuth may be used in even smaller quantities than the above-quoted one-fifth of one per cent.

* * *

Mechanics' Supply Co. Enlarging.

As a result of increased business, the Mechanics' Supply Co., Quebec, are making plans to provide for the future increased trade, and have let contracts for the enlargement of their present commodious and handsome buildings at 80-90 St. Paul street. W. H. Wiggs, the manager of the company, states that two flats 50 x 50 will be added during the coming Winter to the warehouse capacity of his company, and another flat will double their present office space. Mr. Wiggs has every confidence in the growth and development of Quebec as a business centre.

* * *

New Foundry Industry.

On October 8 the first sod of the Canada Iron & Foundry Co.'s new plant was turned by Mr. T. J. Drummond at Fort William, Ont. This marks the commencement of a large and modern foundry where 200 men will be employed. Here will be manufactured railway car wheels and castings, and cast iron water and gas pipes. An up-to-date machine shop equipped with all the latest machinery will be established in connection with the plant and it is expected the works will be running in full blast early in 1907.

* * *

Extending Their Plant.

To accommodate largely increased business in Franklin compressors, the Chicago Pneumatic Tool Co. have found it necessary to still further add to the extensive improvements and additions made this year at their Franklin plant. They are at present adding another 150 feet to their machine shop, which will increase their present capacity from 55 to 70 compressors per month.

* * *

In Their New Factory.

The Kay Electric Dynamo & Motor Co., of Toronto, have lately removed to their new factory and office at 740 Yonge street, Toronto, just south of Bloor. They have added to their already large plant and are prepared to do all kinds of electrical work from the largest to the smallest sizes.

* * *

Canadian Manufacturers.

In many respects the recent convention of the Canadian Manufacturers' Association held in Winnipeg was the most successful in its history. The attendance was much larger than a year ago at Quebec and a vast amount of business of an important nature was disposed of in the businesslike style of the best business men of Canada. It was decided to open a permanent office in London, Eng., to act as a commercial intelligence agency for the association members, to assist in securing skilled labor for the members, and in other ways to promote the interests of the organization. Important steps were also taken in promoting the scheme for the mutual fire insurance of association members.

For the first time in the history of the association the annual convention was held west of the Great Lakes and the event was looked forward to with keen anticipations by the citizens of Western Canada, who, rightly or wrongly, united in considering it a most important epoch in the history of the newer Canada. The west wants manufacturers and is determined to have them, her citizens being thoroughly convinced of the unwisdom of shipping raw materials east and bringing in the manufactured product. The west wants manufacturers and preferably Canadian manufacturers, and hence the keen interest excited by the visit to the west of the Canadian Manufacturers' Association. Winnipeg received them with open arms and everything possible was done to show the visitors the advantages offered them by the metropolis of the west. In the excursion westward which followed the convention the principal western towns have been visited and in all an effort has been made to show the visitors what the west has to offer them. It may be confidently expected that one result of the western visit of the manufacturers will be the establishment in the west of many branch factories and the opening of many more branch warehouses.

The officers elected for the ensuing year were as follows :

President — Harry Cockshutt, of the Cockshutt Plow Co., Brantford.

First Vice-President — Hon. J. D. Rolland, Rolland paper mills, Montreal.

Provincial Vice-Presidents — Ontario : L. Harris, Brantford ; Quebec : G. A. Vandry ; British Columbia: John Hendry, Vancouver ; Manitoba : L. C. McIntyre, Winnipeg ; New Brunswick: Chas. Macdonald, St. John ; Nova Scotia : T. M. Cutler Halifax ; Alberta : A. E. Cross, Calgary ; Saskatchewan : E. J. Brooks, Regina ; Treasurer, Geo. Booth.

COMPANIES INCORPORATED.

Canadian Primelectro Co., Limited, capital $1,000,000, propose to manufacture and deal in electrical machinery and equipment. Head office, Montreal.

The Russel Gas Co. have been incorporated with $5,000 capital, to manufacture gas for light, heat and power purpurposes in the village of Russel, Man.

Pintsch Compressing Co., of the State of New Jersey, licensed to carry on business using the system of Julius Pintsch for lighting cars, steamships or buildings.

The Manitoba Government has granted a charter to the Provincial Contracting Co. to carry on business as builders and contractors. The capital is $150,000, and Winnipeg is the chief place of business.

The Winnipeg & Northern Automobile Co. is incorporated under provincial charter, to carry on a general automobile business. The capital stock is placed at $20,000. Winnipeg will be the chief place of business.

Canada Steam Pump & Machine Co., Limited, share capital $40,000, propose to manufacture pumps and pumping machinery, engines, iron and wood working machinery. Directors, A. H. Eby, T. O. Bard, and A. A. Eby.

The Ontario Iron & Steel Co., Limited, capital $500,000, propose to manufacture, smelt and deal in iron, steel and other metals. Provisional directors, D. Muhlfelder, J. L. Steefel and W. M. German. Head office, Toronto, Ont.

The Ideal Cylinder Snow Plough Co., Limited, capital $100,000, propose to manufacture, sell and deal in snow ploughs. Directors, E. B. Webber, G. Currie, A. H. Hough, M. M. Heiles and A. G. McKay. Head office, Toronto, Ont.

Komnick System Sandstone Brick Machinery Co., Limited, capital $100,000, propose to manufacture and deal in brick making and other machinery. Provisional directors are G. W. Townend, H. L. Douglas and C. Wilkinson, with head office at Toronto.

The Manson Manufacturing Co., Limited, share capital $100,000, propose to manufacture steam engines, boilers, gas engines, gas generators and machinery. Directors are G. J. Manson, S. E. Craig, R. L. Murray, and A. Gunn. Head office, Thorold, Ont.

Welland Electrical Co., Limited, share capital $175,000, propose to purchase, transmit and deal in electric power for lighting. Provisional directors are W. E. Phim, M. McAuliff, W. M. German, R. Cooper, J. H. Crow and C. Henderson ; head office, Welland, Ont.

Scott Machine Co., Limited, capital $40,000, propose to carry on the business of mechanical and electrical engineers and manufacture and deal in machinery. Provisional directors : W. H. Braddon, G. E. Scott, W. C. Scott, E. W. Scott, with head office at London, Ont.

The Standard Gas Holder & Boiler Construction Co., Limited, with share capital of $40,000, propose to manufacture gas holders, boilers, steel tanks, etc. Provisional directors of the com-

pany are L. W. Marsh, W. Henthorn and J. R. Marsh. Head office, Belleville, Ont.

The Saguenay Construction Co., Limited, capital $20,000, propose to carry on a general construction and contracting business with head office at City of Montreal.

The Canadian Electrical & Motor Co., Limited, capital $550,000, propose to deal in and manufacture electric, hydraulic, pneumatic and other machinery. Provisional directors: R. H. Nichols, J. B. Seovell, W. Vandusen, W. A. Johnson and H. A. Drummond. Head office, Toronto.

H. C. Baird, Son & Co., Limited, share capital $100,000, propose to manufacture brick, tile and all other machines, for the manufacture of brick, tile, sewer pipe, etc. Directors are O. Baird, W. J. Mitchell, D. M. McLeod, F. Lindsay and F. J. Hutchins. Head office, Parkhill, Ont.

Canadian Gas Power & Launches, Limited, capital $500,000, propose to manufacture and deal in gasoline, gas, oil and steam engines, motors and motor boats of all kinds. Provisional directors are J. Laishley, W. R. Marshall, Manson Campbell, S. F. McKinnon, D. J. McKinnon, with head office at the City of Toronto.

Barnard-Argue-Roth-Stearns Oil & Gas Co., Limited, with share capital of $100,000, propose to carry on the business of reduction and development company and to operate oil wells. The directors of the company, F. B. Barnard, H. H. Argue, P. W. Roth, J. W. Stearn and A. D. Bissell, with head office at the City of Chatham, Ont.

BETTER THAN THE REVIEW OF REVIEWS.

IT has long been the custom both in this country and England to disparage the attempts of Canadians to produce popular magazines. That the tide has turned is evidenced by the remarks of the editor of one of Ireland's leading periodicals, the Irish Monthly, who asserts that there is in Canada a magazine—The Busy Man's Magazine—which outdistances anything in the same field yet attempted in England. In the course of a long eulogy of this magazine he said: "It seems to realize the ideal that Mr. W. T. Stead proposed to himself better than Mr. Stead himself has done in his Review of Reviews. He, too, proposed to reproduce for busy people the cream of the world's magazines; but he is too original a man, he has too much of his own, to be merely a reproducer. Every page is sure to be studded with Steadisms. His magazine is not the less interesting for that, but it is the less able to give with adequate fullness the best articles of the periodicals of the previous month. The Busy Man's Magazine keeps more steadily—that is the best adverb, and the possible suspicion of a pun must not make us fling it aside—keeps more steadily to its purpose of reproducing for busy men and women the best articles from the current magazines of the world. The form, too, of the magazine is much more pleasant, of a convenient size and shape, and the type large and readable."

CONDENSED ADS.

RATES

One insertion—25c. for 20 words; 1c. a word for each additional word.

Yearly rate—$2.50 for twenty words or less, 10c a word for each additional word.

HAVE you seen our Mechanical and Electrical Pocket Books? They are simply crammed with information invaluable to engineers and others. Many thousands circulated in the States. Price 1s. 2d. and 1s. 8d each post free. Technical Publishing Co., Ltd., 287 Deansgate, Manchester, England. [10]

SITUATIONS VACANT

WANTED — Capable young man with fair knowledge of mechanics, and good appearance as city traveller in Winnipeg. Good position for right man. Box 57 CANADIAN MACHINERY, 511 Union Bank Building, Winnipeg.

WANTED—By new firm, traveler for engineers' supplies Good salary to experienced man with good connection. Full particulars from Baxter, Paterson & Co., care of CANADIAN MACHINERY Montreal. [10]

HELP Wanted — Lathe, bench and planer hands wanted at once; steady work and good wages to competent men; address stating age, experience, married or single and wages expected. B. F. Barnes Company, Rockford, Ill.

WESTERN REPRESENTATIVE WANTED.

AN agent in the west to handle Beardshaws' "Conqueror" high speed steel and drills, which are meeting with a favorable reception throughout Canada. Alex. Gibb, 13 St. John St., Montreal.

MACHINERY WANTED.

SMOKE consumers are not necessary with producer gas power, because the smoke is turned into gas and used for power; no matter what fuel you use there is absolutely no smoke; write for details or call. W. Gillespie, 98 Front Street, Toronto.

CORBET Foundry and Machine Company, Owen Sound, Ont., make a specialty of marine and stationary engines and boiler repairs; also all kinds of sheet steel work, such as stacks, flumes, hoppers, etc.; write for prices.

TURBINE Water Wheels—The following is another proof that the Canadian turbine is the most economical wheel made:—"Almonte, Ontario, with a pair of 42" Canadian turbines, is practically the only town in the Ottawa valley having an extensive electric plant that was able to run to its full capacity throughout this dry summer, with water to spare." Charles Barber & Sons, Meaford, Ontario.

WANTED—Second-hand gasoline engines; from two to four horse power. Krug Bros. & Co., Chesley.

WANTED — Immediately — Horizontal turbular boiler; six to eight horse power; cash price and minute description necessary. Box 8, Otterville.

FOR SALE

"LITTLE GIANT" turbine water wheels, machine-cut wood and iron tooth gearing; power transmission machinery orders executed with despatch; get catalogue and prices. J. C. Wilson & Co., Glenora, Ont.

IRON WORKS FOR SALE

Including Foundry, Machine and Boiler Shops, as a going concern. Located in Western Canada, doing good business and up-to-date plant. Apply to

Sylvester Gasoline Engines

Are the best that skilled labor can produce.

They are easy starting; they are simple and reliable; they will give full power in the coldest weather. Made in sizes from 4 to 32 horse power in portable snd stationary and from 1½ to 12 horse power in marine. They will run on gasoline, coal oil or distillates.

The SYLVESTER Engine inspires confidence because it is so simple in construction. It is the cheapest engine to buy because there is nothing to get out of order.

The SYLVESTER Engine is handsome in appearance, substantial in construction, marvelous in simplicity, unequalled for effectiveness and durability.

THE HIGHEST AND MOST PERFECT TYPE OF GASOLINE ENGINE BUILT.

If you require to purchase, write for Catalogue and our 1906 Calendar. We will then send our Travelling Salesman to you.

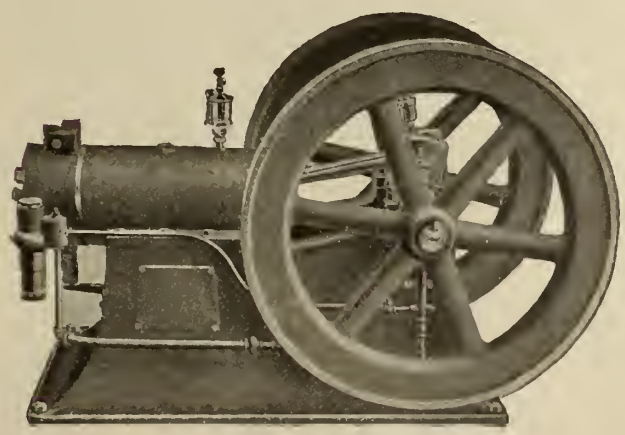
The Famous McVicker



One third the number of parts.

The only four cycle engine that will run either way.

The only improvement in gas engines for forty years.

Governor ten times as sensative as any other. No gears, cams, eccentrics or trigger work of any kind.

The Canadian McVicker Engine Company LIMITED

GALT - - - ONTARIO

Have You Any Use For a Dictionary That Contains Definitions of About 5,000 Distinct Words, Terms, and Phrases Employed in the Practice of Electrical Engineering?

No matter whether you are an expert electrical engineer, or an every-day electrical workman, your answer cannot be other than "yes"—unless you already have a copy.

When you know that the dictionary of which we are speaking is called

STANDARD ELECTRICAL DICTIONARY

and is compiled by no less renowned an authority than Prof. T. O'Conor Sloane, you will readily understand why ten editions of the book have been issued.

In his preface the author says: "The science [electrical] has expanded so much that the limits of what may be termed strictly a dictionary of the present day, would a few years ago have sufficed for an encyclopedia." **There you have an idea of the scope of the "Standard Electrical Dictionary."**

Again: "Each title or subject is defined once in the text. Where a title is synonymous with one or more others, the definition is given under one title and the others appear at the foot of the article as synonyms. It may be that the reader is seeking the definition of one of these synonyms. If so, a reference to the index shows him at once what page contains the information sought for. . . . . Where a title embraces several words, all orders of the word will be cited in the index." **There you have an idea of the serviceability of the "Standard Electrical Dictionary."**

There are 682 pages, 393 illustrations, and the price (postpaid) is

$3 00

Fill in, Cut out, and Mail

KERR TURBINE BLOWERS

For Gas Works, Foundries and Forge Shops

More economical than steam engines, require less attention, lubrication and space. No belts or reducing gears. Speed adjusted to pressure desired. Regulation close. Quick starting and stopping. Air pressure, 6 to 15 ounces. For any capacity.

TURBINE GENERATORS, 2 kw. to 300 kw. direct current; alternating current, 25 to 300 kw., 60 cycle. ***CENTRIFUGAL PUMPS*** for water works, condenser equipment and boiler feeding.

The illustration shows a 30 h.p. Kerr Turbine with extra heavy blower. 2850 r.p.m., 12 ounce pressure. 4150 cubic feet per minute capacity. Floor space, 28 in. by 72 in. Weight complete, 3000 lbs.

Main Office:

KERR TURBINE CO., Wellsville, N.Y.

FOUNDRY *FACINGS, SUPPLIES, EQUIPMENT*

ATTENTION TO THE SMALL EXPENSES MEANS **AN INCREASE IN PROFITS**

Is there not a possibility for some saving in your business? For instance, how about the cost of cleaning your castings, etc.?

Investigate. Be sure that this work is being done as well and as economically as it can be. Don't clean your castings by hand methods. Life's too short. Be up-to-date. Use an **"Economy" Steel Wire Wheel Brush.** A great labor-saver. Does the work of five men. For every piece of work you finish by hand methods, your competitor with an **"Economy" Brush** is doing five times as much in the same time, and it's better work, too.

A customer, who has been using "ECONOMY" BRUSHES for the past six years, writes:

Your ***"Economy" Wire Wheel Brushes*** enable us to get CLEANER CASTINGS and a MUCH BETTER FINISH on our goods, and at a LESS COST than by any other method. We have tried other methods and other wheel brushes, but have not found anything from which we can get equal results. ***Hundreds of users of "Economy" Wheel Brushes will tell you the same.***

ASK FOR BOOKLET No. 111

The Attachment Facilitates the Moving of Work

RADIUS PLANER ATTACHMENT
FOR PLANING LINKS, BLOCKS AND CIRCULAR WORK ON ORDINARY PLANERS

A Pin projecting from a plate bolted to the table of the planer holds an upper table upon which the work is fastened.

Thus the work may be moved forward or backward and to a greater or less distance from the centre pin, the amount of circular movement determining the radius of the circle to which the work is finished.

Weight, boxed, 510 lbs. Size of platen, 15x34 Inches.

H. B. UNDERWOOD & CO.
1025 Hamilton St., PHILADELPHIA, PA.

GRAPHITE PAINTS

MACHINE PAINTS

ISLAND CITY

It is well known that Graphite makes one of the best paints as a preservative of exposed metal work. It is the best paint to use for iron castings or girders on account of its filling properties thereby giving it a good covering.

BESIDES the ordinary, our machine paints are made in paste form and can be used as a filler, applied with a knife or thinned with turpentine and brushed on, spreads freely and leaves a good surface.

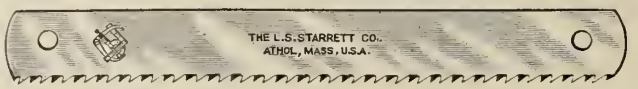
STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH

HACK SAWS



These blades are made of the finest grade of steel. The teeth are sharp, with square cutting points, and evenly set. They are tempered by our improved process, which leaves them hard and tough, so that they will not "shell off." They are too hard to file. The set of the teeth is just enough to insure a free, smooth, and rapid cut, removing no more stock than is necessary.

NOTE.—The words underlined in this text are selected from the list of three hundred contained in Circular No. 2, issued by the Simplified Spelling Board, which is carrying out a campaign for reformed spelling under the patronage of Andrew Carnegie.

When the Dunlop hands are not found stampt on rubber, there's something mist

The rubber business has no center. In every nation there is at least one firm which has thoroly developt the sience of preparing finisht rubber from the crude imported stock. Here in Canada the Dunlop Company has held a stedfast purpose, and now it is lookt upon and talkt about as Canada's national rubber supply house.

Pneumatic Tires

Altho the name "Dunlop" has come to stand for a pneumatic tire that may be easily attacht or detacht, it has as good a right to stand for a pneumatic tire of any form—for the inflated tire is the invention of J. B. Dunlop. It was an easy process to develop the Dunlop idea and apply it to pneumatic tires for automobiles, sulkies and ambulances, as well as for bicycles. In order to make them strong enough for the heavier work, it is only necessary to put in more rubber and stouter fiber.

Solid Rubber Tires

Skilfulness in one department of rubber tire making is sufficient license for successful practise in the other branches also. It is all a matter of rubber. Dunlops make tires for every style of vehicle from a fire engine to a baby carriage, and put into them a quality of rubber that cannot be surpast. Internal wire and cushion tires for carriages. Side wire tires (an exclusive Dunlop property) for heavy vehicles and wagons. The endless side wire tire for motor trucks. These lighter tires are shipt to the dealer in continuous lengths.

"Comfort" Rubber Heels

There is a surprize in store for anyone who has never walkt on heels made of Dunlop rubber. Too many rubber heels are woful imitations of shoddy and reclaimed stock, and besides having no "life," they become chipt or scrapt away after a little wear. "Comfort" heels will give a spring to the step down to the last point of wear. They are made of Para rubber, and not only will they last as long as hard leather heels, but they will also give a firmer and more buoyant step and absorb all the jar that is sent thru the spine when hard pavements are walkt over. Put on by all shoedealers for fifty cents the pair. Heels of good rubber are worth it and cannot be sold for less.

Dunlop Steam Packing

In all, the Dunlop two hands are stampt upon forty distinct kinds of articles of rubber. In this list is comprized "Polar Bear" and "Ebony Black" Packing — another Dunlop success that is possest of unusual qualities. It will remain rubbery no matter how tightly it is comprest and its fiber cannot be destroyed by action of live steam, hot or cold water or oil.

Facts About Merrell Pipe Threading and Cutting Machines

When it comes to a question of service.
When you consider ease of control and operation.
When you think of economy in operation.
When you consider speed and stability.
When you think of the nature and knowledge of the operator—
When you think of all this—doesn't the name **MERRELL** come naturally as the one and ideal Pipe Threading and Cutting Machine?

We will send you this Merrell on thirty days free trial.

You'll find that in the quality of the material used in construction—in the improved cutting off tools—the new encased gears, Oilers and Chasers—the standard self-opening and closing die-heads that this Machine will do more work—better work—and do it cheaper than you believed any like machine could do.

Write us to-day for new literature containing descriptive matter and prices

A Town's Industrial Awakening

After Many Years the Town of Welland, Ontario, Suddenly Realized Its Future as a Manufacturing Metropolis

OPPORTUNITY knocks but once, it's said, but for a whole generation this supposedly elusive visitor has hovered about the threshhold of Welland, awaiting but a nod to enter and revolutionize the town. Opportunity has come. Nine new industries have been added to the town within a year, a feat not heretofore paralleled for a town of its size in Canadian industrial history. From all appearances the onward tide must continue until the once standstill hamlet has become a centre of manufacturing industry unsurpassed on the Western peninsula of Ontario. This is strong language but is backed by stronger evidence. Great events are known to spring from incidents of small import. The loss of an industry that might have been kept marked the turning point in Welland's career, and initiated a movement that will create there a city in the immediate future. The seal of progress has been stamped upon the municipality and it cannot turn back. It is marked for greater strides that must inevitably follow in the train of what has already taken place. With advantages a dozenfold greater than many other Canadian towns, it possess potentialities that make possible a second Pittsburg such that a prophesy in this direction has very material evidence of future fulfilment.

Far Reaching Advantages.

In a word Welland has probably the cheapest transportation, cheapest natural gas, cheapest electric power and light and the most inexpensive land values to be found in Canada. A well laid out town with fine public buildings and pleasantly situated in the healthiest district in the world where a progressive and aggressive citizenship exists, the centre of a rich agricultural district, and a proximity to the largest fruit farms and nurseries in Canada are a further combination adding to the desirability of residence in this much favored centre.

Unique Transportation.

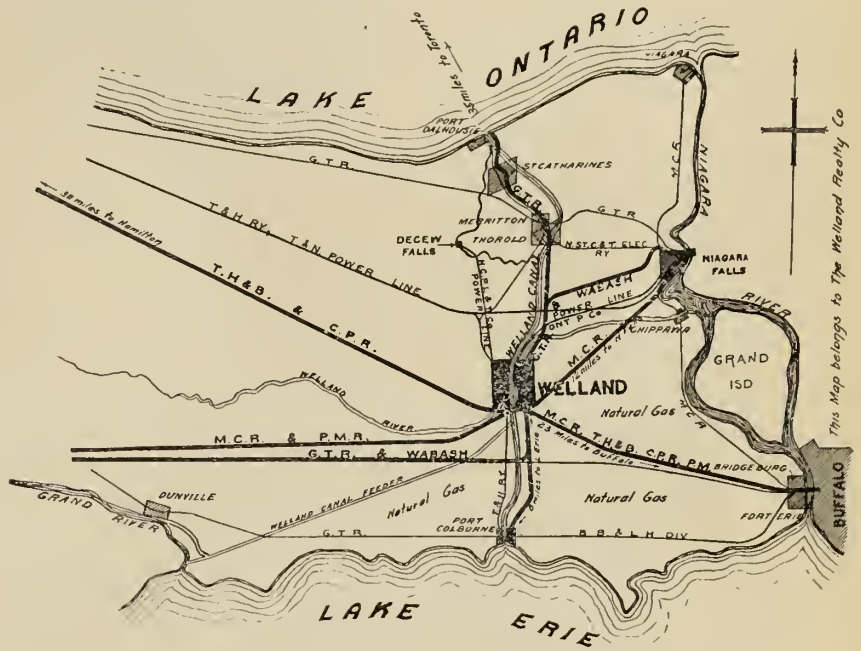
First and foremost of these advantages are its unique transportation facilities. The fact of the town's situation at the head of deep water navigation from the Great Lakes gives it a commanding position over other places, insuring beyond peraventure its bounding to the forefront in proportion as the signification of this becomes generally recognized. Railway facilities are superb. The town is located on every trunk railway line in Canada, of which there are five. This leaves no possible want from a shipper's point of view.

The Welland Canal the great shipping channel between the east and west passes directly through the centre of Welland. From Duluth to near Welland the waterways will accomodate vessels drawing twenty feet. From Welland to the Atlantic fourteen feet is the greatest draft. This makes the town the natural lightering point for heavy freight from the West, and consequently a place for manufacturers to locate. To accomodate the deep draft vessels from the West, the Government are building a large turning basin which will make, eight miles inland, one of the finest harbors connected with the Great Lakes. Thus shippers get the lowest of lake rates inward and to and from the seaboard, which gives them the advantage of inland competitors on all freights during the season of navigation.

Welland is in the Buffalo district for rail shipments and has the same freight rates as that city on all goods coming into Canada from the United States. The Grand Trunk, the Toronto Hamilton & Buffalo, the Michigan Central, C.P.R., the Pere Marquette and the Wabash all enter Welland. Thirty-six passenger, mail and express trains go and come every day, making it possible to get in or out of the town at almost any hour of the day or night. It follows with no need of comment that freight facilities are proportionately excellent.

25c Gas and $15.00 Electric Power.

Here is found the cheapest light and power enjoyed by any municipality in Canada. To show Welland's position regarding the availability of electrical energy for light and power needs but a mention of the recent call for tenders to light the town, where five competing companies bid, the contract going to the lowest tenderer at a rate not known elsewhere in Canada, possibly in America. $40 an arc-light year, all night and every night. Niagara Falls is but twelve miles distant with its 5 power companies, and electrical power is available in Welland to-day for the startlingly low sum of $15.00 per h.p. per annum. Electric power is also being delivered from De Cew Falls, by the Cata-



Map Showing Welland as Railway Centre

ract Power Company. Natural gas is abundant. Its abundance makes it cheap. In fact it is sold at so low a figure that people leave their lights burning in much the same manner as electric lights are left on in places where a flat rate is imposed. People heat and light their homes with natural gas. Manufacturers have it ready to run their plants. The cost to the consumer is but 25 cents a thousand cubic feet. This makes it possible to produce power by means of gas engines in the neighborhood of $8.00 a year. What other town can make such a boast as this?

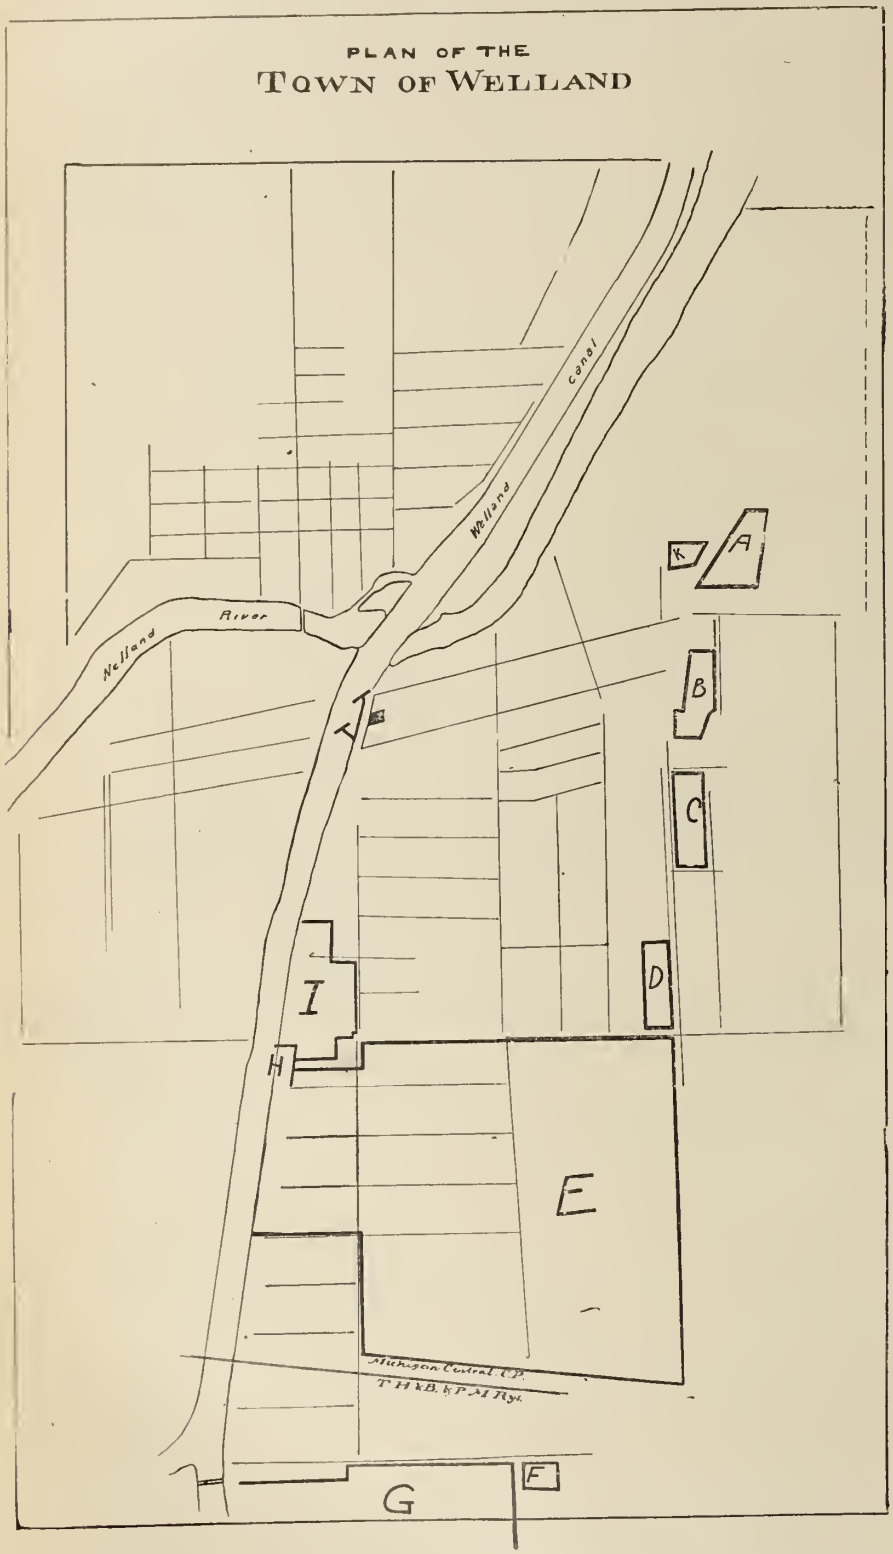
Some Other Features.

Welland is the county town of the County of Welland. This county is one

of the most aggressive in the forward movement for good roads and has arranged in conjunction with the Ontario Government to build 170 miles of permanent roads at a cost of $1,500 a mile or a total cost of $255,000.00. This system will radiate from Thorold, Niagara Falls, Bridgeburg, Fort Erie, Port Colborne, Wainfleet, Pelham to Welland and will include all centres of population in the county as well as connecting leading roads from adjoining counties.

A system of water works has been provided to supply a town five times that of the population of Welland in 1905. The water supply is taken from Lake Erie. The town is well sewered.

10 miles of concrete walk have been built.



INDUSTRIAL DEVELOPEMENT IN ONE YEAR;
(A). Barcalo Bed Works; (B). Supreme Heating Co., Works; (C). Canada Forge Co; (D). Robertson Machinery Co; (E). Plymouth Cordage Co; (F). Cheese Factory; (G). Ontario Iron and Steel Co; (H). Turning Basin; (I). M. Beatty and Sons; (J). Welland Realty Co.

A perplexity in the town at present is the house problem. The new industries already started will require the influx of hundreds of mechanics and several hundred houses must be built almost immediately to supply the demand.

A Bit of History.

A decade ago the town of Welland contained a newspaper, the works of M. Beatty & Sons and Robertson Bros. The first industry to come to the town was the Frost Wire Fence Company, who got a grant amounting to $600.00 distributed over three years. In the grant was an old church, used as a factory, and part of the fuel. At this time it was hard work to interest the citizens of Welland in industrial advancement. The Frost Company prospered and grew and about five years ago built a new place on the G.T.R. near the station. The council of that day agreed to give the Frost Company exemption of all taxation except the school tax, but neglected putting the by-law to the people. In the course of about three years an antagonistic council was elected who refused to remit the taxes. The by-law was then put to the people and defeated, resulting in the Frost Wire Fence Company moving to Hamilton.

This marked the turning point in the career of Welland's industrial development. It was a signal of awakening in the town. When the people realized they had lost the only plant they had been successful in obtaining for a number of years they suddenly became aware of the importance of attracting industries to their town which has so much to offer. Every man in town with any sense of citizenship at once put his shoulder to the wheel with wonderful results.

Recent Industrial Progress.

The first industry to come to the town was the Canadian Barcalo Co., manufacturers of iron beds who employ about twenty men. They took the building of the Frost Wire Fence Company and the town was glad to give the terms previously refused the former company. Then the greatest triumph for the citizens of Welland culminated with the decision of the Plymouth Cordage Company of North Plymouth, Mass. to establish their Canadian factory there. After looking over the advantages of various towns the company refused a bonus of $75,000.00 cash from one municipality stating that with Welland's advantages that amount would be saved every year. The company have secured 180 acres of land. Buildings are all erected. The machinery has been nearly all installed, and operations will commence immediately. For the property, plant and equipment,

houses. etc., the company have spent $1,000,000.00.

Next on the list was the reorganization of Robertson Bros. into the Robertson Machinery Company to manufacture hoisting engines and to carry on a general machinery business. The company was formed by Welland capital,

Large Freighter in Welland Canal

Mr. C. H. Hanson, leaving the Frost Wire Fence Company at Hamilton to take up this work. At the present time the company has five acres of land on the Grand Trunk on which the firm intend building two buildings one 150 by 40 and the other 150 by 60 feet, comprising machine shop, foundry and blacksmith shop. This will increase the facilities about 400 per cent. The calls for orders for this company during the past year amounted to five times the the output.

A by-law affecting the Ontario Steel & Iron Company which proposed establishing at Welland and M. Beatty & Son who were already established was put to the people at the same time, both of which passed with only 2 decenting votes. The firm of M. Beatty & Son are building an enormous new plant of the finest structure possible and asked for a fixed assessment of $10,000.00 for twenty years. The Steel & Iron Company asked for $6,000.00 or a site when they had paid out $100,000.00 for a plant and $100,000.00 a year in wages. This firm is aggressively going ahead and will be in active operation within a very few months.

The next industrial enterprise to come before the attention of the people of Welland was the Iroquois Motor Company and a by-law was passed granting them their request of a site of three acres of land and a fixed assessment of $6,000.00. The foundation of their building has already been built.

History was being rapidly made. Shortly after this another double by-law went before the people, and passed as former ones had, which affected the Supreme Heating Company and the Canada Forge Company. These two by-laws asked for land aggregating $3,300.00 and water extensions amounting to $2,000. The assessment was fixed at $2,000 each for ten years. The Canada Forge Company is an aggressive organization with Mr. Thos. J. Dillon as president and general manager. Their works are now completed and ready for installation of machinery, making a record in building construction. The Supreme Heating Company was an American concern, the Canadian branch being formed in this country and Canadian capital fostering it.

This in brief shows the wonderful advance that has come to Welland within the past year. It demonstrates more strongly than anything else that Welland must have extraordinary natural advantages to attract so many industries in such a short space of time and at practically no financial outlay. The future of the town of Welland is bright indeed. Enough has been done to demonstrate how much more is possible. The momentum already acquired must carry the town forward industrially and must see it, in less than two years a busy manufacturing city throbbing and pulsating with industrial activity.

The Welland Construction Co.

With such a large amount of building under way in the town of Welland, it is important that a construction company should be established. Only a few months ago the Welland Construction Co. was organized, and already are engaged on a number of the most important building contracts in the town. At present the company are at work on the construction of the iron and steel plant, which is to be in operation about the first of May. They have established a record in building construction in the completion of the Canada Forge Co.'s plant, on Nov. 17, the works being under construction 26 days. One of the greatest secrets of the success of this company is the fact that they have at their disposal an unlimited amount of labor. Coupled with this, is the embodiment of the latest methods in building construction with a practical experience that brings results. The agreement of the Iron & Steel Co. with the town, calls for forty houses before the plant is operating. These likewise will be erected by the Welland Construction Co., who have taken hold of the building up of the town in an admirable manner. Work already done by this company has received high commendation from various sources, and the town of Welland is glad to have in its midst a company capable of handling the problem of construction, that must confront the municipality in the near future.

A Familiar Scene at Welland, Ont.

The Advantages of a University Education in Connection with Railway Work *

By Dr. H. T. Bovey, of McGill University

PERHAPS a brief history of the establishment of a course of railway education in McGill may be of interest. At a time when the Grand Trunk and the Intercolonial were the only main railways in Canada, it was my fortune to come to this country. I came for the winter, and the winter suited me so admirably, that I decided to make Montreal my home. Having, therefore, made up my mind to throw my lot in with this great Dominion, I thought I would do what I could to advance the education of young engineers. I had been one of the engineers on the Mersey Docks for some years, and was fortunately employed on many important works of construction, so that I may claim to be not an entirely theoretical man. In the year 1880 I went to Mr. Brydges, who at that time was General Manager of the Grand Trunk Railway, and endeavored in my most persuasive language to ask him whether the railway could not combine with us in outlining a course adapted for the training of railway men in all departments of the service. Mr. Brydges did not take kindly to the suggestion and characterized it as the idea of "another of those theoretical men." "We have our own way," said he, "of training up engineers, and we are quite satisfied." I remarked that it was evidently no use asking him to do anything in the matter, but that the time would come when the railways themselves would take the matter in hand.

A few years ago Sir Thomas Shaughnessy generously volunteered the proposal that the Canadian Pacific Railway would give its support to any well-devised scheme for the proper training of railway men, expressing the opinion that the future railway man must be trained along university lines. Mr. Hays, who was also present at the time, acquiesced in this opinion, and promised similar support on the part of the Grand Trunk. The present railway department at McGill University is the direct result of the far-sighted views of these eminent men. Soon after the co-operation of the Intercolonial and the Great Northern Railways was secured, and the future of the railway department at McGill became assured.

The railway courses are divided into two parts. There is the theoretical branch, which we, and probably every railway man, consider most essential on this subject. I have received communications from distinguished railway presidents, managers, engineers, etc., and they all express the opinion that a certain specified theoretical training is of the highest importance in every department. They further say, however, that important as the theoretical training may be, it is largely nullified without a practical knowledge of their work. The question became then, how was that practical experience to be gained? and the difficulty was met by the railway companies agreeing to do their part in providing the practice. After discussing the matter with the railways interested, we came to this conclusion, that, possibly the preliminary practical

Dr. H. T. BOVEY.
Dean of the Faculty of Applied Science, McGill University

experience, or what might be called the student apprenticeship, could be gained during the summer vacations, and the railways agreed to take a certain number of students. While the students are with them, they agree to place them in different departments of the work, so as to give them—not a complete knowledge, which is impossible in the few months at their disposal—but to give in a general way a preliminary training in railway work. This continues for three summers, and reports are prepared, which are returned to the railway officials, who in this manner get to know exactly what these young men are doing.

In my own opinion, the success of the whole scheme depends largely upon the proper carrying out of this apprenticeship system, and especially the apprenticeship after graduation at the university. The young graduate is then expected to spend a couple of years with the railways, being moved about from department to department until it is found in what particular department he may give the best service, and if he is the right kind of man his future is then assured.

Again, it was considered unwise to appoint a permanent professor of railway management or of other essentially practical departments, because the railway manager of to-day, if he separated himself from active railway work to-morrow would be out-of-date. The lectures then, which are to give some idea of railway management, of freight and passenger traffic, etc., are to be given by men in active practice.

Well, the railways with ourselves seemed to think, at all events, that we might make a trial by starting along these lines, and I believe the course as now outlined will prove successful. I believe that we shall turn out men who will be worthy to succeed those who have gone before them, and I think the young men of this country will have an opportunity such as their fathers never before had.

In working out this scheme I might say that it took two or three years to get all the information, and most of the prominent railway men on this Continent were approached. Their views, perhaps, may be of some little interest to you as showing what they think of the whole scheme. As now outlined by Mr. Morgan, it indicates pretty clearly the course we are to pursue at McGill, and this course has received the approval of the great railroads of this Continent.

I would like to quote you a few opinions on this subject, because, as I said at first, there is nothing in the new proposals which has not been supported by prominent railway men.

Mr. Carstensen, of the New York Central Railroad, writes:

"The great advantage to a young man of a university training is that it moulds his mind, and fits him to deal with affairs and men of affairs. As at present conducted, the education obtained in universities does not seem to produce men who, at first, are of as

* An address before the Canadian Railway Club, Montreal, on October 2, 1906.

much value to the railway service as the boy trained up gradually from the lowest to high positions, but subsequently it has been found that the university-trained man moves forward more rapidly on account of the wider breadth of view inculcated by his superior education, although he may not be able to deal with small details as the boy from the common schools."

Mr. Carstensen is strongly of the opinion that the university-trained men will be productive of the very best results. His company, the N.Y.C.R., employs a large number of graduates, and he gave me many instances of their success, comparing their progress with the progress of those coming from the common school, and gradually working their way up from the office.

Then, as you know, the Pennsylvania Railroad has always insisted upon the employment of university-trained graduates in certain of their departments. They have two classes of apprentices, viz., a class of special apprentices, consisting solely of college graduates, and a class of ordinary apprentices. If any of these ordinary apprentices show any marked ability, they give them leave of absence, and allow them to go to a university in order to get that theoretical training which will make them more valuable to the railroad. On their return, they are immediately placed in the class of special apprentices. Mr. Atterbury, General Manager of the Pennsylvania Railroad, says, that the rule of employing university graduates has been extended, as far as possible, to all other depart- of the railroad, and with the best possible results.

Considering again the locomotive department, with which many of those present are so intimately connected, I should like to quote the opinion of Mr. Vauclain, of the Baldwin Works. He says :—

"The ideal training for a student intending to take up locomotive work should be a general college education along the lines of Mechanical Engineering, extending over a period of two or three years."

He says better results might be obtained if the student could be required to take a post-graduate course in some railway works.

The greater responsibilities and the greater rewards in the operation and management of railroads are generally given to those who have been trained and developed in the actual service. The result of this state of affairs is that the railroad student is used for railroad construction rather than for railroad operation. The mass of information necessary for the operation of a railroad cannot be obtained in the class room, but must be acquired in actual experience in railway work.

Speaking of the work we propose to do in McGill, Mr. Atterbury is of the opinion that such a course should assure for railroad managers and assistants greater intelligence and greater usefulness than the present methods.

As far as the operation of a railroad is concerned, we have, I think, solved the problem by establishing in connection with this railroad scheme what we call the operating department. We have specialize on the civil, the mechanical three distinct branches, and you can side, the operating side, but in each of these departments everyone taking this railroad course must take certain subjects that are common to all, such as economics. In addition, we also give them in the third and fourth year a broad literary training. I would like to emphasize this fact rather fully, because we find that young men who come to us often do not know how to write a letter, and very often do not know how to say what they want to say. A great railway manager told me, about eighteen months ago, that he had had during the year several hundred applications for positions. These applications came from graduates from technical schools all over the continent, and only a very few were expressed properly, or in good language, or grammatically. Of course, this is a very lamentable showing, but we hope to get rid of such a criticism ourselves by continuing their English training in the third and fourth years

Amongst other people interviewed, and who showed the greatest interest in our scheme was Mr. A. W. Gibb, General Superintendent of Motive Power of the Pennsylvania Railroad, Altoona, Pa. He wrote me a long statement, and thus closed his remarks :—

"Taking it altogether, I think the course is one to be very much commended, and while I do not think that from any technical institution full-fledged railroad men will ever emerge, I think that such a course will save future railroad men much of the threshing of old stuff which a man without this training would have to go through.

"If you can get a man to think straight, I think the rest will depend upon his opportunities, and upon the use he shall make of his training."

Mr. Berg, Chief Engineer of the Lehigh Valley Railroad, and eminent also for his writings on this subject of engineering education, says :—

"The higher branches of the railroad should be considered as a profession, and as a profession provision should be made for an adequate training. The misplaced belief that practice can only be learned in practice has caused thousands of boys, not only in railway service, but also in mechanical and industrial pursuits, to be consigned yearly to the same rut, as others before them. Taken as a whole the young man may be able to become familiar with data and statistics, but experience is a very slow teacher, and it is usually costly to the party that pays the bills."

Opinions of this kind from men like Sir Thomas Shaughnessy and Mr. Hays, and the many others, who are the acknowledged leaders of their profession, should and did have great weight. Perhaps I might here be allowed to express a little feeling of pride, and at the same time I think we all ought to feel proud, that our University was the first in the world to set forth a fully thought-out scheme for the education of railroad men.

We cannot, of course, expect to meet with complete success at once. We must be guided by the opinions of men like those who are present this evening. We are always ready to modify any of our work to meet what might be considered by men in active practice as a desideratum. May I therefore ask for your hearty co-operation and aid in the development of this great work. Railroad work is changing all the time. There is a danger of practical men becoming somewhat fossilized at the university. If we are to keep up with the times, I would ask every one of you to send to Mr. Morgan, from time to time, any suggestions you may have to make on this subject of railroad education In weighing one subject against another, bear in mind that we have only a limited time at our disposal, and cannot, therefore, very well cover the whole of railway education in twenty-eight months. If you will, from time to time, give Mr. Morgan suggestions, he will, I am sure, most carefully consider them, and we shall do our best to meet your wishes. In this manner I think we shall secure success.

What I wish to impress upon you is the fact that the McGill University scheme is not a scheme based upon ideas of theoretical men, but it is a scheme based upon the combined opinions of practical and theoretical men in the highest positions.

I shall be very pleased to answer any questions on this subject, or in regard to the scholarship you are thinking of founding. Such a scholarship, I may be allowed to say, will be a great help to us, on account of the prestige it gives to the University. It will strengthen our hands, because in starting a new course there are always plenty of people prepared to throw cold water upon it, and when we meet with enthusiasts on the subject it helps us to continue our work with greater vigor, and a determination to make it a success.

CANADIAN MACHINERY
and Manufacturing News

A monthly newspaper devoted to machinery and manufacturing interests, mechanical and electrical trades, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

WHY DO MUNICIPALITIES STAND STILL?

IT is not because they do not wish to grow. Nearly every town and village has a sleepy desire to expand and grow big and outrival its neighbors. People there would like to see industries coming, the town's limits expanding and property values increasing, but of course with no effort on their part whatever. Then why do all the municipalities in Ontario where a future for manufacturers is assured, and where opportunities are so numerous, not enlarge as would a well regulated and healthful business in times of prosperity? Apart from natural advantages the reason and solution lie with the citizens themselves. In most instances those who could and should help to build up the place in which they reside, and which holds their business interests, are either too engrossed in their own affairs or else entirely indifferent. Take town after town, and municipality after municipality in Ontario and this is found to be the case. The growth of the town is found to be in direct proportion to the public spiritness of the men who mould opinion and who take the lead in public affairs. This might be laid down as an axium and holds in the case of Ontario towns to-day.

Since our last issue we have had an excellent opportunity of finding out how interested the various towns in the province were in their own growth. In the November issue an editorial reference regarding a United States manufacturing firms intending to come to this country to manufacture was suplemented by a post card sent out to about fifty cities and towns calling attention to the fact. Of these at the time of going to press thirty-seven showed no interest in the subject whatever. This being all the more surprising since the industry in question was not looking for a bonus. It was noticed of the thirteen who did reply the quickest and most businesslike responses were from places having a live Board of Trade. Before the issue had been many hours off the press and before the card calling attention to the opportunity was sent out the secretary of the Board of Trade of one of the most progressive and enterprising towns in Canada was in our office to get full information. The spirit displayed by the Board of Trade in this instance has been characteristic of its policy for years past. The result is that a manufacturing town has been built up, the result of the citizens own efforts that for stability and general beauty is not surpassed anywhere in Canada.

In direct opposition to this spirit was that shown by another town whose reply came in about two weeks after their attention had been drawn to the matter. It was answered by the town clerk, who, of course, had to bring it before the town council before even making a reply or even asking for further information. Had there been in that town a live up-to-date Board of Trade the matter could have been taken up immediately, the information secured, and, if necessary, a representative sent to interview the manufacturers in question. The local newspaper comes out announcing the fact that the town is just the place for that industry and then everybody falls asleep and no further action is taken.

The town whose Board of Trade secretary was first to seek the information has a splendid opportunity of securing this industry. The leading men of this latter town have at all times joined hand in hand for the town's welfare, have sought at all times to build up the town in every legitimate manner possible and have themselves created for the most part the town's many promising and flourishing enterprises.

About two years ago the town of Welland hardly realized it had a future. One happy day in the town's history

the town folk woke up to the fact of the town's possibilities and realized its advantages for industrial concerns. They lost no time in getting together and within 18 months worked with such success as to create a record in industrial progress in Canada.

The citizens of many a town may say, and it is often heard by those unwilling to make an effort in their town's behalf that inasmuch as we have nothing to offer what is the use of trying to compete with places having greater natural advantages. If those same citizens spent only a fraction of the time now spent gossiping in the back room of the local drug store in planning for the town's future and in themselves creating industries they would have no complaint to make regarding their town's progress and development.

POOR CALCIUM CARBIDE.

IN a recent weekly report of the Dominion Commercial Agent at Birmingham, Mr. F. D. Ball complains of a poor quality of calcium carbide received from Canada. In a letter received by him from a buyer in England it was stated that many users in that country would prefer buying from Canada instead of from Norway and Germany, but unfortunately the quality of the goods was not up to the standard required. Mr. Ball states "This is now a matter for the Canadian manufacturer to look into. There is one thing the British want and that is a first-class article and all Canadian exporters of whatever class of goods should bear that in mind. British naturally wish to buy their goods as cheaply as possible, but they will not buy an inferior article because it is a shade cheaper. This fact cannot be brought home too strongly to all manufacturers in Canada. It has been repeated time and time again, but its very repitition seems to weaken its strength. Costly blunders have been made heretofore in the case of dairy products and apples and it is unfortunate that the manufacturers of calcium carbide in this country should have to be brought to task for the quality of their goods.

In taking up the question with a large consumer of calcium carbide in this country it was found that the complaint from Great Britain had not been without cause. In some instances it was found that the gas produced from the carbide was from 25 to 33 1-3 per cent. less than the standard amount.

This is a rather serious matter since the low quality of one line of good reflects against the entire industries of the Dominion. Manufacturers of calcium carbide in Merriton, Shawinigan Falls and Ottawa should state their position in the matter. While letting a statement of this kind go without challenge they are admitting the justice of the remark and at the same time placing themselves in a position of having the good name of all Canadian exporters injured by their action.

CAN THE EFFICIENCY OF THE SUCTION GAS PLANT BE INCREASED?

BEHIND the efficient and complete steam power plant of the present day are centuries of experimental work. The modern steam plant would be a wonder to the ancients, and it is doubtful whether Watt would recognize in it the development of the simple steam apparatus for which he did so much; but in spite of this the low efficiency of the modern steam power plant is a thorn in the side of the thinking engineer of the present day. It was in 1876 that the producer gas plant was first though of, and in 1878 the first producer gas plant was built by Dawson. The idea of a producer gas plant was suggested shortly after the invention of the Otto cycle gas engine, by the desire of a cheaper form of gas than that used for illuminating purpose. This plant was a pressure plant, and because of its complication and the attendance required, did not gain favor rapidly, although it is quite efficient. Between this date and 1895 little progress was made. In 1895 the first suction producer gas plant was made by Koerting Bros., Germany, and this started the development of suction gas plants, which are now made by numerous firms in Europe and America.

Tests made on these suction producers during the last two years show them to have a thermal efficiency of from 75 to 80 per cent., by thermal efficiency meaning the ratio of the heat units in the resulting gas to the heat units in the coal used in the production of the gas; and it was shown that the coal used in the producer per brake horse-power per hour available at the engine to be in the vicinity of 0.9 lbs. If one compares this coal consumption with that of the most efficient modern steam power plant he will be enlightened as to what suction gas plants and gas engines are doing. It is not to be expected that the coal consumption in actual practice will be kept as low as this because of the coal consumed in starting the producer.

If, then, due economy such as described can be obtained from suction gas plants after a development of only eleven years, is it not reasonable to suppose that an even better efficiency will subsequently be obtained? Upon investigating the losses in the plant and in the engine, one would be led to answer in the affirmative. The chief constituents of the gas are hydrogen, carbon monoxide, marsh-gas, carbon dioxide, and nitrogen. Of these the first three are the only useful constituents, carbon dioxide and nitrogen being inert gases. These inert gases increasing its heating value. Carbon dioxide is the result of complete combustion of carbon with oxygen, and in its formation coal is consumed to no useful purpose. This forms one of the sources of loss in the producer gas plant. The nitrogen comes directly from the air and the only objections to it are, that it absorbs heat from the producer, a good part of which is lost to the cooling water in the scrubber, and that it increases the volume of the gas for the same heating value requiring a larger engine cylinder for the same power than would be necessary if it were not present. It is reasonable to suppose that in future better air regulation may be obained so that there may be no surplus oxygen for the formation of carbon dioxide. Then will be eliminated one of the inert gasses and part of the other, since the air is responsible for the nitrogen. Another source of loss is the heat which the gasses give to the cooling water in the scrubber. At present part of the heat of the gas coming from the producer is utilized to generate steam and to superheat it; and in future it may be hoped that still more of this heat will be utilized to further superheat the steam and also to pre-heat the air blast and the coal in the hopper. In this way it may be possible to extract the heat from the gas to such an extent that but little heat will be left for cooling water, when the scrubber will act more as a washer than as a cooler. If the steam were superheated it might be possible to increase the proportion of steam to air when more hydrogen and less nitrogen would be obtained in the resulting gas. The exhaust gas from the engine might also be used to pre-heat the air blast and coal supply, thus increasing the efficiency of the plant. The remaining source of loss in the producer is through radiation, but this is a very minor one.

Follow Up Systems Bring Results

"Keeping Everlastingly at it Brings Success."

By Geo. H. Pedlar, Jr.

THE general idea of the "follow up," either by letter or by personal solicitation, over the counter or otherwise, is now recognized by all live business people, as being the essence of salesmanship. No up-to-date business man would think that he had served a customer fully, when, in answer to a question as to the price of a cake of soap, a pair of boots, or a sixty-six foot tape, he should say 5c., $3.00 or 75c., as the case might be, and let it go at that. That would have answered, perhaps, once upon a time, because there may have been no other cake of soap, pair of boots or sixty-six foot tape carried in stock nearer than Hogs' Hollow, seven miles down the pike.

To-day, however, conditions are different—so very different that one has to say much more than the mere giving of prices, and the things you say, determine even more than the price quoted, whether your customer purchases or not, because it is sure true, that almost anyone will pay 25 cents or 50 cents or even more, in addition to the price he figured on paying, provided what is told him by the salesman, sounds good to him.

Every business house must determine for itself, what is proper to say in a follow-up as well as how and when to say it. We adopted a crude follow-up, as long ago as ten years, which, as time has passed, has been closely watched as to results, until now we are as perfect as we know how, though always looking for better results.

Following up Letters.

With the receipt of a letter, we make our answer, as far from the general stereotyped style as possible. The letter gives the clue. In two days' time, we take up the same letter, and go after the prospective customer again, from another point of view, but still on the same subject. Then if, after a reasonable time, we have no response, we present the subject from some other point of view, because, while one argument might interest one man, it might take a much different one to interest another. Failing to get a reply of any kind, to this effort, we write a straight appeal, asking a reply. Generally, we have a response to this and it gives us a new chance for continuing the subject.

Sometimes, however, even this remains unanswered, but we do not stop there. Oh, no! The man may have gotten married in the meantime, and forgotten, for the time, that his barn ever needed a new roof. So we file his and our letters away—to give him a chance —and, in three months, take up the subject again. We get many orders from people after the "second round," and, as our business motto is, "Keeping everlastingly at it brings success," we could not very well drop any communication, until something definite had resulted.

Our customers in Canada are served from our warehouses located in most of the principal cities, necessitating our maintaining a follow-up system in each office. But they all work as a unit, each adopting the same general scheme as outlined.

We believe in the follow-up idea so much, however, that a weekly letter is

G. H. PEDLAR, Jr., Oshawa.

sent from this office, to all agencies on one subject or another, appertaining to the business, and our letter on the follow-up system was :

In our business a man may write for prices with the intention of ordering some kind of building materials right away, and for some unknown reason his plans may be altered. He might have a death in his family, or sell his place, and buy another, or for a hundred and one reasons change his plans, but the point is, that having once received an inquiry from a man he should not be lost track of till you receive a definite understanding or order from him.

Inquiries cost money. Every post card you receive saying "Send catalogue and best prices" costs money, much more than you imagine very much more. For instance, the "ads" we are now carrying cost $500 per month. Suppose all told, we get ten inquiries per day or three hundred per month (and we don't) that is say $1.50 that each inquiry costs. One dollar and a half to get an inquiry. It's a lot of money, but it pays provided the inquiry is properly handled after received. It's alright for one to say that such and such a postal received is N.G. and calls for nothing more than a reply, and then to be passed up and forgotten. That's wrong. I have tried it myself and was very much surprised later on to get an order from the same man, who in the beginning inquired in the tone of a school boy. There is no rule to follow except the correct one, of treating them all as if they were from the largest concern in the world. One is very apt to slight a reply to a man rated at nil, while giving minute attention to a man of position. Nevertheless, one is just as apt as the other to use some goods. A "Follow Up" system is simple, and while involving some trouble—like anything else that's worth while—it pays without a doubt.

If you have not got a small card index let me know and I will get you one. If you have, this is being written first with an idea of giving you some slight idea of the cost of each inquiry, and second with the idea of impressing you with the importance of following up thoroughly. The most profitable business you can get is the business that comes in by mail. It's also the best, because you can write twenty letters a day at the expense and time of going personally to one man, and while the chances for orders solicited by mail are not to be compared with the chances of getting an order by personal solicitation, still the cost is not so great.

Letters Should Be Original.

The form in which letters are written is the basis of all successful mail order propositions. Every one agrees that the live business man of to-day avoids entirely the stereotyped form of business letter of fifty and even a dozen years ago. Don't say "Yours of the 6th inst., received and in reply beg to say." That's antiquated and does not serve the purpose. Throw it right into a man from the first word. Go right at your subject on the first line.

Ninety-nine inquiries give you some clue as to what the man had in mind when writing, and if it does, go after

that particular point on the jump. People are not interested now in anything that pertains to dead wood they want the meat.

Another thing. Don't trust to your memory. You may have the best memory of anybody in the world, but you will forget. Besides it doesn't pay. A man to make a success of his business now-a-days has enough to think of without cramming his head full of details. Who ever heard of the president of any company keeping his cash book in his head? It could not be done, and done correctly neither can a "Follow Up:' system.

Day Work vs. Piecework *

By D. B. Swinton, Montreal.

THE first authentic record of piecework, known to us, is when the Israelites in captivity under Pharoah were allowed their provisions in return for making a certain number of bricks per day. This system remains the fundamental basis of present day piecework, a man's efforts requiring him, when on piecework, to devote for his personal advantage, more energy than he would were he paid straight time.

The success of piecework as a shop principle depends largely on the amount of care and attention which the system receives from the foreman. Nothing can be more abused than improperly priced piecework, and the advantage of piecework can only be obtained when both employe and employer are taken into consideration when deciding upon the price to be paid.

In certain shops a system is in vogue which may give in a measure some satisfaction, but which for general purposes can hardly be recommended for general use. That is, in straight construction work a man is engaged to make a certain piece at a certain price, but this interferes with the elasticity of shop management and prevents the swinging around of work in the shop that is sometimes found necessary.

The system with which I am in touch and which apparently gives satisfactory results both to men and company, is as follows: While the company does not encourage a large percentage of gain in piecework, over day work, they permit a man a maximum gain of fifty per cent. on blacksmith work, so that a blacksmith paid at a 20-cent-per-hour rate can in a ten-hour day, with properly adjusted prices, make $3, or an increase of $1 over his time.

This applies particularly to a man conversant with this work and who, to make and warrant this increase, is willing to exercise more energy than he would were he working on a straight hourly basis.

In placing a man on piecework he is for all practical purposes being admitted to an active interest in the shop in which he is working, and as a certain article is supposedly worth a certain price to the company, he is assisting in the success of the shop by increasing the output of that article as well as financially benefiting himself.

In figuring on prices, I have always taken into consideration the actual amount of machine and manual labor required to make a certain article, the rate of the men performing the labor and the nature of the work. A man working on cold work scarcely merits the same return for his labor as one who is working on heavy forging, where his physical labor is made particularly hard on account of the heat which he has to endure. Then, again, the actual cost of production by day work should be considered, as there is no benefit to anyone concerned unless the cost of the finished product can be reduced when placed on a piecework basis.

After arriving at a figure which seems reasonable for all parties concerned, it is placed on record and the timekeeping department is advised of the price after it has been certified to by the master car builder. Care is taken to have the price figured out carefully as it is not considered creditable to a foreman to rectify his prices after they have been placed on record, although in a progressive shop where new ideas, tools, dies and machines are being constantly brought into service with a view of increasing the output and reducing labor, the scale of piecework prices existing prior to the introduction of an improved system should be carefully adjusted and when found necessary should be reduced so as to correspond with the improved condition.

In the Canadian Pacific Railway shops before any piecework price can be increased, reduced, or placed on record, it is most carefully scrutinized by the master car builder, who satisfies himself that the price is just for all parties concerned before he will authorize its issue.

The count of pieces is made by each charge-hand for his particular section and a report of the same sent in to the shop office, signed by the charge-hand, and after approval it is handed over to the piecework inspector who is in the employ of the auditing department and who keeps a record of the time, rate, price, and order distribution. He also keeps a check on the count, and should he so wish, may request a second count to assure himself that all is correct. Out of 220 men employed in the shop about 120 of them are working constantly on piecework. In the writer's opinion, the output of any shop will be almost doubled by placing, wherever possible, a price on any article.

The benefits to be derived from piecework are numerous, some of them being: Increased output; prevents what is commonly known as "soldiering," as when a man has to depend upon his own exertions for his day's pay, he will naturally put his best foot forward; shows up "dead men," as it can easily be seen when a man is working on piecework, whether he is doing his best; standardizes the work, as a man who is placed upon a particular job will rapidly develop into a specialist, when he is allowed to use his judgment as to the best way to increase his day's pay; the work turned out by a piecework man has the benefit of being uniform; keeps good men in the shop, as the steady men in a shop are the piecework men who, through fear of being replaced on their piecework during their absence, lose no time, unless justified in doing so.

Care should be taken and judgment used when it is found necessary to cut or reduce a price as it is a well known fact that all men are not to be measured with the same rule and it would not be justice to a man to reduce his price on piecework, simply because he has through using his head, brains and body, been able to exceed the output of his predecessors on the same class of work. Indiscriminate price cutting is an evil to be avoided as much as possible.

Care should be taken in the actual count being returned and if men are made responsible for their work and obliged to replace any rejected material it will force them to turn out only work that is satisfactory.

* Discussion at the Railway Master Blacksmiths' Convention.

"You've been so prosperous this year you ought to be very happy." How can I be happy when I haven't a thing in the world to growl about?"—Atlanta Constitution.

Producer Gas: Its Production and Application

A Series of Articles on Producer Gas, Its Production and Application as Shown by German, French, English, and American Practice.

By Emil Stern

ARTICLE II.

HAVING dealt in the October issue with the description of the old Pressure Gas plant and with the history of the invention of the Suction Gas Producer, we showed how gradually the way from the pressure to the suction type was made.

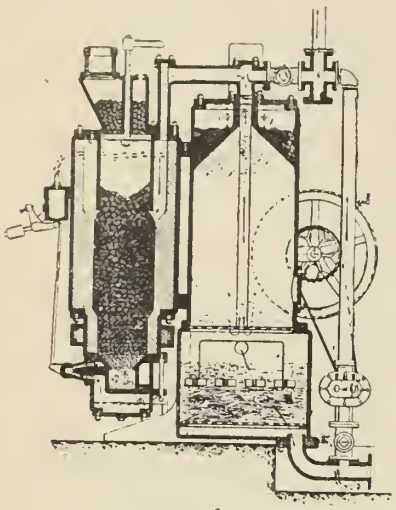

Fig. 5. The "Delassue" Producer.

The suction gas producer has gained nearly the whole field and it is astonishing how trifling the changes have been that different constructors have made after the year of the invention 1901. Not a single one shows a difference in the principle and after all it is just a matter of experience to find the right proportions only and a strong and reliable design.

It would fill books to show and to describe all of the constructions that have

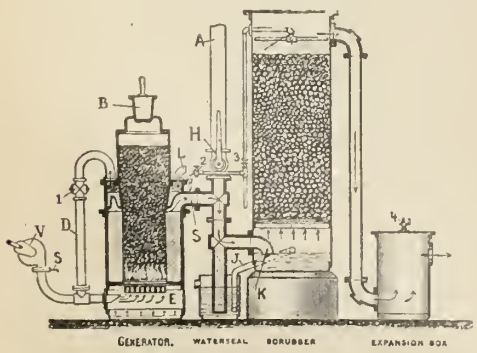

Fig. 6. "Acme" Producer.

made their appearance on the market within the last five years.

Principle of Producer Plant.

The gas making process the principle of all the suction gas producers for power purposes is the following: The gas engine works as a suction fan on the plant driving its suction stroke, producing a vacuum in the plant. The result of this temporary vacuum will be that air will be sucked into the plant wherever it is open. There is a hole provided in the producer for this purpose. The Oxygen (O) of the air sucked this way into the producer will try to burn the coal and to combine with the carbon (C) of the coal to form carbon dioxide (CO_2), but as the air supply to the producer is kept insufficient it will only form a little Carbondioxide (CO_2) most of the resulting gas will be Carbomonoxide (CO).

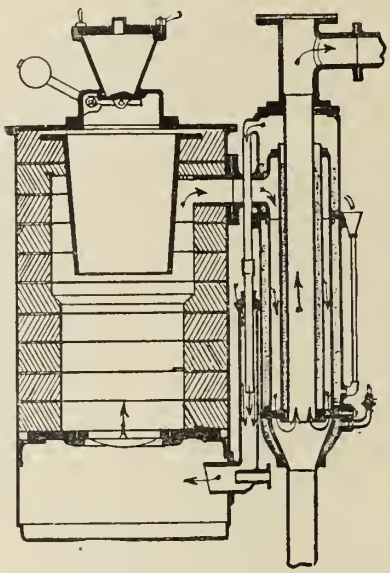

Fig. 7. The "Vedy" Producer.

Carbomonoxide is a very powerful and strong gas, while (CO_2) Carbondioxide or Carbonic acid has no heating value at all.

The gas when it is generated is as hot as the incandescent fuel where it is produced from, but it has to be cooled down for the use in gas engines. This sensible heat was wasted in the old pressure plant, now we use it to raise some steam in a water vessel or vaporizer so that two important actions are done at the same time, the gas gives off its heat and some steam is generated. This steam is used for the following purpose. The steam pipe opens into the ash pit so that the steam cools the grate and then gets into the incandescent fire. The intense heat changes the water particles into hydrogen and oxygen. The oxygen is used as the oxygen of the air partly to burn the coal to keep the intense heat necessary to break the water, partly to combine with carbon of the coal forming carbonmonoxide. The hydrogen and carbonmonoxide are the two driving forces of the gas engine. The gas leaving the producer and vaporizer is chemically ready, but there have apparatus to be provided to clean it from dust so as to save the expensive material of the gas engine.

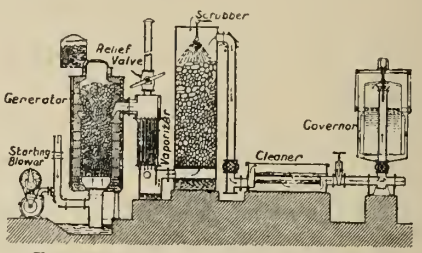

Fig. 8. The "Pintsch" Producer.

Different apparatus have been designed for this purpose. The most common feature is a wet scrubber filled with coke, water running from the top to wash the gas which enters the scrubber at the bottom. As the gas leaves the scrubber more or less in a wet condition, it will always be well to dry it in a purifier, usually filled with sawdust. After this general explanation it will be easy to understand the design of various producers showing special features of the same.

Various Styles.

There is considerable divergence of opinion with regard to the fuel support. The majority of makers supply fire bars, so fitted that renewals can be easily inserted without interfering with the lining of the producer. Many designers provide a wet ash pit so that the water vapor rising from this helps to keep down destructive temperatures.

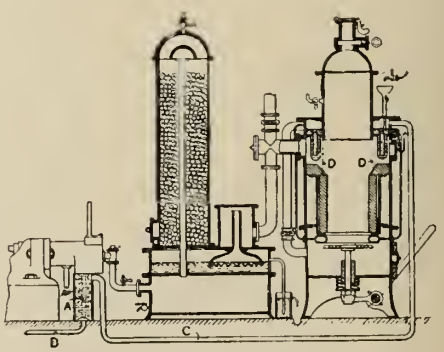

Fig. 9. The "Dynamic" Producer.

Fig. 5 shows the Delassue producer with a water cooler casting at the base of the full bed this forming the vaporiser.

Gas Outlet.

After leaving the fuel bed, the gases, before being conducted away from the generator and passed to the cooling and

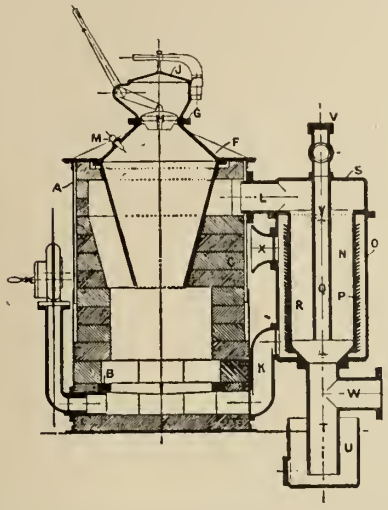

Fig. 10. The "Kynoch" Producer.

washing processes, are allowed to collect in the upper portion of the generator, and to circulate round the distilling bell. In many designs—as in the Acme producer, Fig. 6, they are made to pass under or through a dish of water before the final exit. Sometimes the outlet is placed a considerable distance above the fuel bed to allow a large quantity of coal to be distilled gradually within the generator—as in the Vedy producer, Fig. 7, and, as the pro-

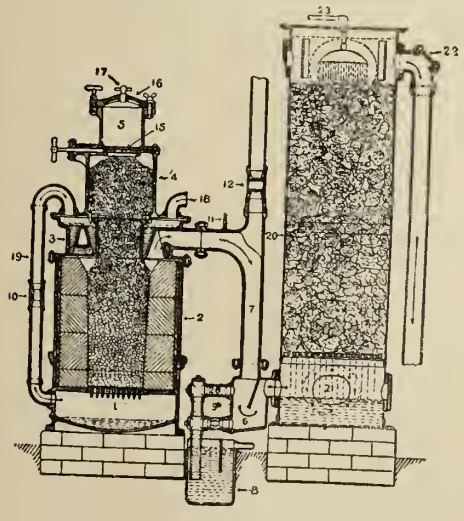

Fig. 11. The "Tangye" Producer.

ducts yielded during the process expand downwards through the coal, the great heat of the rising gases converts the tarry vapors into fixed gases and in this way, with efficient washing in the scrubbers, the tar difficulty is reduced to a minimum.

Messrs. Pintsch (Fig. 8), instead of allowing the gas to circulate round the distilling chamber provide an annular collecting space about half-way up the generator. This method has much to commend it. Being entirely formed by the firebrick lining there is no burning away of metal, while the entire heat of the gas is available for the previous coking of the coal as it settles down through a restricted area. In this method there are no cold surfaces within the generator to favor the deposit of soot, while the small portion of heated firebricks exposed to both the hot gas and fuel ensures that distillation can only be a slow process and that no excessive yield of volatile gases is possible, even after a heavy charge of fresh fuel.

The Dynamic gas producer (Fig. 9, above) is fitted with a gauge screen around and above the fuel. The screen filters the gas and holds the solid par-

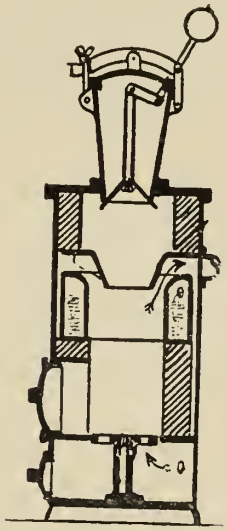

FIG. 12. The "Davey-Paxman" Producer

ticles within the generator until converted.

When comparing the designs which have as a feature a large cast iron "distilling" bell above the fire, it is to be observed that, to avoid the drawing up of incandescence through one portion only of the fuel, and especially when light loads only are being served, many manufacturers build the firebrick lining so that the gas is diverted from a straight path from fire to gas outlet, as in the Kynoch producer, Fig. 10.

Charging Hoppers.

There are a great variety of hoppers, nearly every maker seemingly having his own device. With one or two exceptions they have double valves, permitting recharging during operation of the plant without admission of air.

The valve at the base of the hopper is operated in many ways. In some French plants a pivoted false bottom is used, which upon the movement of a lever horizontally, swings aside (Fig. 1). In normal operation of the producer this sliding door is held to its seat by a spring sufficiently strong to withstand the weight of the fuel admitted to the hopper.

A similar slide differently actuated is

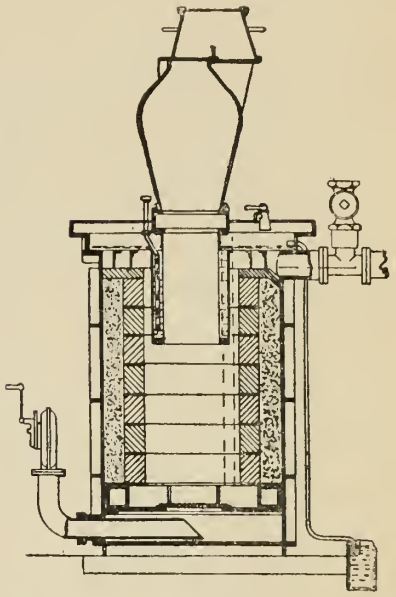

Fig. 13. The "Crossley" Producer.

shown in the Taylor generator, but in this example the position of the lever has to be carefully fixed to keep a tight joint.

The Tangye slide (shown in Fig. 11) is directly operated by a T handle, and is distinctly preferable to the two methods previously noted. The slide, however, must be nicely arranged to work freely without air leaks, and even with

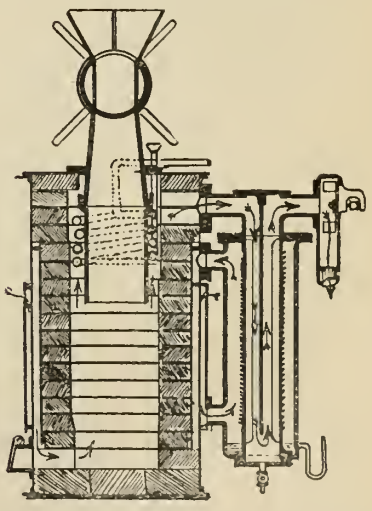

Fig. 14. The "Industrial" Producer.

care it is sometimes impossible to avoid jamming a piece of coal between the top and bottom faces of the fixed portion and the end of the sliding shutter. Especially is this liable to occur when the distilling chamber is previously well filled and the hopper is charged and

emptied without regard to the height of the fuel already within.

Mitre valves loosely hung above their seats and operated by a lever interior to the hopper are commonly used. (Fig. 10.) Their use entails rather more air admission with the fuel, however, as, to allow lifting from the seat, the hopper cannot be filled compactly.

Similar valves held by balance weights against a bottom seating have several advantages (Davey · Paxman producer, Fig. 12). The hopper can be completely filled and air excluded without interfering with their operation while, swinging suspended from their supports, they guide the fuel in this deseent and can be brought to their seats even if the hopper has been carclessly overfilled.

Charging slides, however, have an advantage over valves in that a poking tool can be inserted. at will right through the generator to the firebars—a central hole giving access all round the fire. With suspended valves, it is

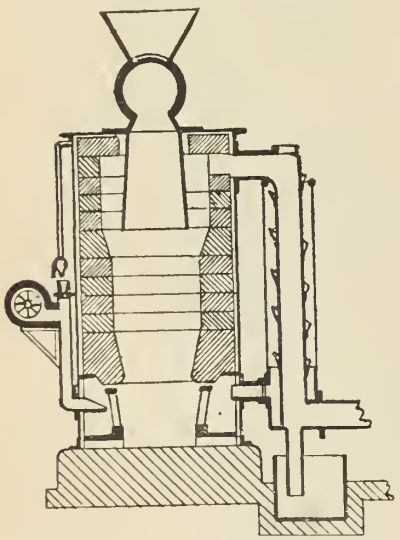

Fig. 15. The "Mersey" Producer.

necessary to provide at least one poking hole in the side of the casing below the feeding hopper, and unless two or more holes are provided circumferentially in this position, very little poking can be done. When clearing out at week-ends the swinging valves somebar.

what restrict the use of the clinkering

In place of slides or valves a revolving hood is adopted by a few makers (Cressley, Fig. 13, Pintsch, Fig. 8). To keep these in easy working order demands a little more care, otherwise they have advantages in many ways, as will be apparent from the remarks made previously.

Several makers are now adopting a cylindrical valve which, once filled and afterwards rotated, empties its contents into the generator, and with continued movement, again resumes the "charging" position. For clearing out purposes the charging cylinder can be entirely or partially removed (Industrial Fig. 14, Mersey, Fig. 15, Watt, Fig. 16).

Hopper lids, by some makers are very

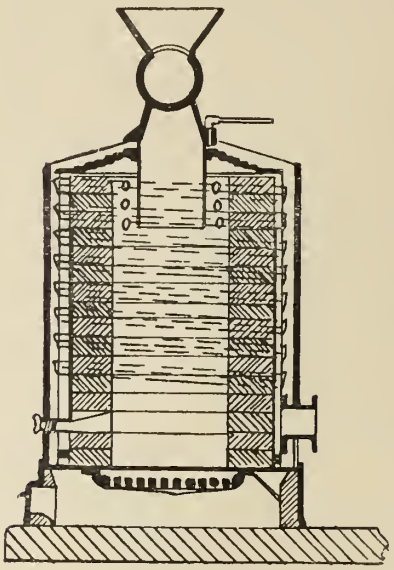

Fig. 16. The "Watt" Producer.

carefully clamped to their seats, while others trust to a good joint being made by the lid's own weight. The latter seem to answer every purpose, and, when suspended by a link from an overhanging swinging beam, fitted in a socket upon the rising hinge prineiple, there is a minimum of trouble involved. (Dowson, Fig. 17, and others.

A recent invention is intended to replace hand stoking by an automatic device operated by means of a piston subjected more or less by suitable adjust-

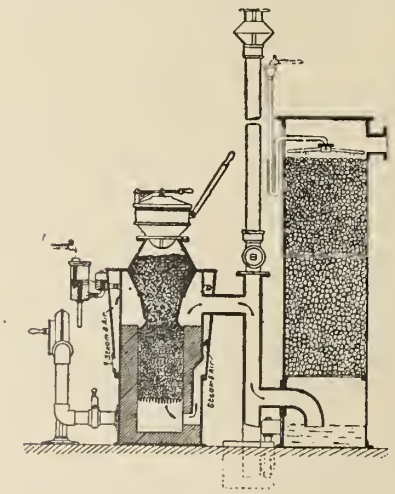

Fig. 17. The "Dowson" Producer.

ments to the rise in pressures in the pipe connecting the exhaust chamber with the open air at each exhaust stroke of the engine, (Griffin, Fig. 18). The piston is spring loaded, to ensure its quick return, and a ratchet movement causes a worm and work wheel to rotate a cylindrical feeding box. This box is divided into compartments of such dimensions that only a small quantity (about 2 lbs. of coal) is fed into the producer at one time, and it is claimed that, as the engine takes more or less explosions when doing its work, so does the automatie fuel feed accomodate itself to the corresponding coal consumption. The inventor, Mr. Griffin, of Bath, claims that the device is a great success, that the fire is maintained at a uniform depth under varying load conditions, and that it is possible to work with a clear fire and thus to take advantage of a larger proportion of the sensible heat of the fire and gases for the evaporation of water.

PREPARE FOR A HARD WINTER.

That the coming winter is going to be the hardest one for the past twenty

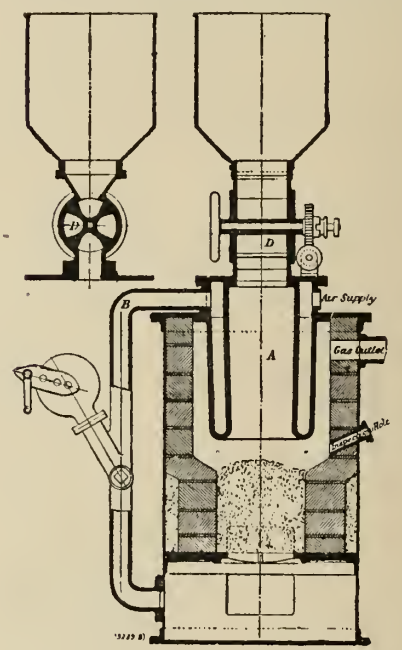

Fig. 18. The "Griffin" Producer.

years there is an abundance of signs to show, says an exchange, and among them may be mentioned:

The corn husks are a foot and a half thick, and all the stalks lean to the west.

The geese, ducks and chickens are growing a coat of fur under their feathers, and are rubbing borax on their feet to harden them up.

All the one-eyed owls are leaving the country a month earlier than usual, and the bob-tailed squirrels are laying in sweet potatoes, as well as nuts, for winter provisions.

The farmer who has taken the trouble to investigate has found that all the toad stools on the old logs have wrinkles in them. The last time that this happened we had winter weather that froze the handles of plows.

Milling Machine Attachments.

THE UNIVERSAL SPIRAL HEAD.—By John Edgar

BY the judicious use of the many attachments that have been devised for the purpose the variety of different operations that a milling machine may be made to perform is greatly increased. With these attachments a universal milling machine can handle any conceivable piece of work and be used in the solution of many a hard problem.

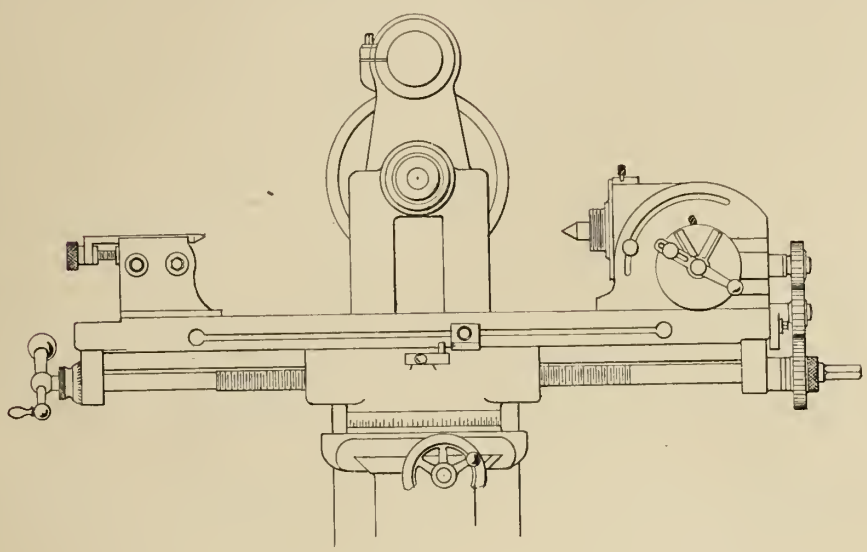

FIG. 1.

Some Attachments.

Among the attachments that have been adapted to the milling machine we may mention, the universal spiral head, the plain spiral head, the plain index head, the plain centre, the multiple centre, the tilting centre, the vertical spindle attachment, the angular milling attachment, the universal milling attachment, the rack cutting attachment, the worm gear hobbing attachment, the high speed milling attachment, the rotary milling attachment, the slotting attachment, the taper milling attachment, etc.

Description of Head.

The most common and the most used is the universal spiral head. This attachment is furnished regularly with all universal milling machines and may be considered an component part of the machine, but it is really an attachment and as such it will be treated in this and the following articles bearing on its construction and use.

In principle the spiral head is a device by which the work operated on is made to revolve about its own axis by suitable mechanism and if desired can be given a movement at the same time in a direction parallel with its axis producing on its surface, if a cutter or tracing point is applied to same, a helix which may be given any lead or, pitch within the limit of the range provided by the change gears.

The universal spiral head is a spiral head in which the axis of the work spindle may be swiveled in a vertical plane throughout a range usually greater than that of ninety degrees.

The universal spiral head is used in the process of cutting gears either spur, bevel, spiral or worm gears, in milling the flutes in cutters whether straight or spiral, in indexing work of all kinds, and in general tool work of that character.

In order that the operator may obtain the best results in its use he must know thoroughly on just what principles it is based and the general construction of the head together with the method used in figuring the possible combinations of gears and the use of the index plates in making accurate divisions.

The universal spiral head is always accompanied by a tail or foot-stock which is of some peculiar construction allowing its spindle to be raised or elevated so as to support the tail end of the work driven by the head spindle centre when such work is held in an angular position. Figure 1 shows a front elevation of a universal milling machine fitted with the universal spiral head and foot stock. The head is always used in the position shown, i.e. at the right hand end of the table, where it is used in connection with the lead screw which acts as a driver to actuate the work spindle in cutting spirals, in cases where spiral cutting is desired ; but if the head is used only as in index head it may be placed in any position along the table as may be most convenient. The foot stock is set along the table in a position corresponding with the length of the work.

In figures 2 and 3 the head is shown

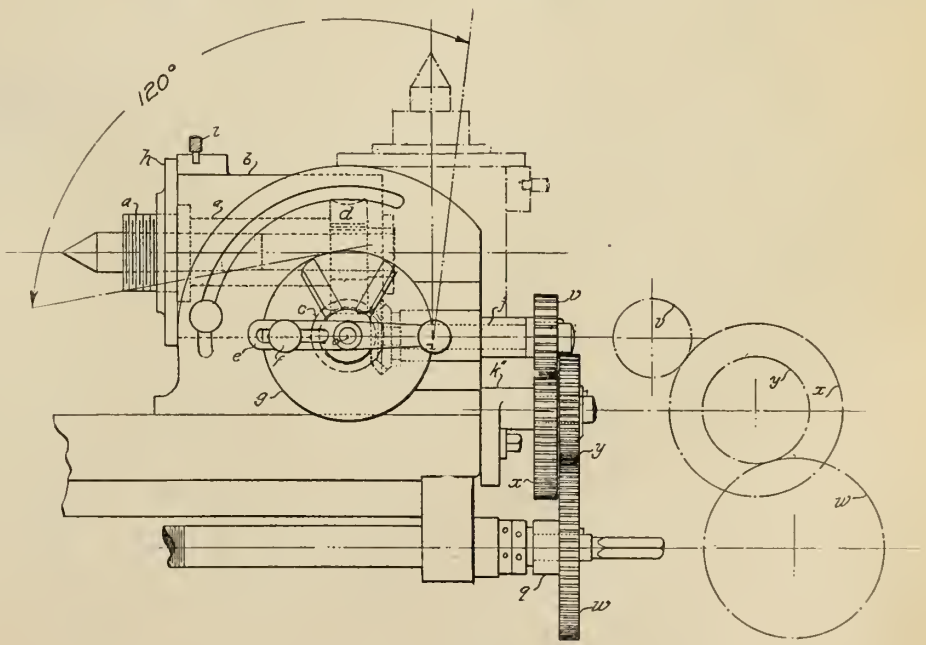

FIG. 2.

more in detail ; Fig. 2 being a side elevation and Fig. 3 a rear view. The internal mechanism is shown dotted in,

in the figures and consists of the members as described in the following.

Adaptation and Capacity.

The work on revolving spindle (a) of the head is carried in the swivel block (b), which is swung on trunnions so that it may be set at any angle within certain limits which are usually 15 degrees below the horizontal and 15 degrees beyond the vertical position making a sweep of 120 degrees which is ample range to handle the most complicated case that is liable to present itself. Some heads are made so that when fitted for indexing only, the complete circle of 360 degrees may be swept by the spindle but very little advantage is obtained by this extra degree of range. One of the conditions of the requirements of the universal spiral head is that the spindle may have a working position any where within the range of the arc of inclination. In order that this may be accomplished the connection between the spindle and the screw from which the former takes its motion

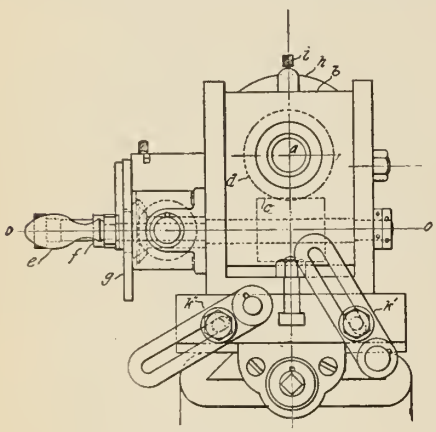

FIG. 3.

must at some point in the train be centred about a swivelling member in such a manner that the motion of the spindle is not interrupted. In the design shown this is accomplished by making the centre of the trunnions concentric with the axis of the worm used to drive the worm gear keyed to the rear end of the spindle. This cutter is (o) and the worm is indicated by (c), the worm gear by (d). It is easily seen that motion may be transmitted through the worm to the spindle with the latter inclined in any position in a vertical plane.

For the purpose of making divisions only, the head is complete when composed of those parts just described, no other parts being necessary since the revolving of the spindle a fractional turn is all that is required at each indexing. In order that the process may be more accurate and certain the worm shaft is extended and a crank (e) is placed on end of same, this crank being provided with a detent pin (f) which is so made that it may be dropped into holes in an index plate (g). The holes in the index plate are equally spaced and a number of plates are provided with different numbers of these holes drilled in the face of same. This gives a large range of divisions that may be made with a head so equipped. The number may of course be indefinitely increased by increasing the number of holes in the plates.

The worm gear (d) is made, in most heads, with 40 teeth and the worm a single threaded affair giving 40 turns of the worm or index crank to one turn of the spindle or worm gear. This may be considered standard practice.

From this we see that in order to index for 40 divisions, such as 40 teeth in a gear held in the work spindle,—it is only necessary to give the crank a series of 40 complete revolutions for eighty divisions, a series of 80 half turns would have to be made or in a more technical language we take a plate that is drilled, say with 20 holes and turn the crank through 10 holes for each division. This is what is known as plain indexing and is the most common form of obtaining accurate divisions of the circle that is in use. There are several others which will be taken up later on.

In order that the plates may be limited in number and yet cover as large a range of divisions as possible, there is need in the careful selection of the number of holes in each series. This has all been brought down to a standard by the builders of these heads, so that a series of 18 circles, each having a different number of holes, which are as follows: 15, 16, 17, 18 ,19, 20, 21, 23, 27, 29, 31, 33, 37, 39, 41, 43, 47, 49, usually arranged on three plates, though in the latter models the plates are made much larger and drilled on both sides, making it possible to place the whole series on one plate which is reversible, the side being used that has the desired circle. The circles are numbered so that it is not necessary to count the number of holes they contain, making it much more convenient than it would be otherwise.

Index heads and spiral heads are always accompanied by an 'index table,' which gives the different divisions that may be obtained with the equipment furnished, and reads as follows:

No. of divisions.	No. of holes in the index circle.	No. of turns of the crank.
10	any	4
11	33	$3\frac{21}{33}$
12	39	$\frac{13}{39}$
13	39	$3\frac{3}{39}$

A table of this kind reads like so much Dutch to any one not initiated into its mysteries, but it is in plain English, as follows; for 11 divisions,, we make three complete turns of the crank and then advance the fractional turn of 21 holes in the circle marked 33. The whole number in the third column always indicating complete revolutions of the worm or crank, and the fraction the part turn as indicated by the numerator which gives the number of holes, this fractional turn is to cover the denominator showing the circle in which the numerator is to be taken. These tables give the ordinary divisions obtainable with the three index plates mentioned, and will give readings for all divisions up to 50 all even and those divisible by 5 up to 100 and most numbers up to 360.

When it is desired to obtain a division not shown on the table, we may find the number of holes required in the plate, and the manipulation of the crank by very simple reasoning as follows:

Since the worm gear has 40 teeth and

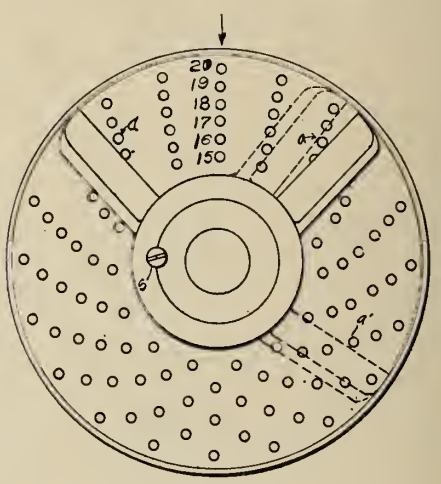

FIG. 4.

the worm a single thread, their ratio is 40 to 1, and therefore, it takes 40 turns of the crank to make a complete revolution of the spindle, in order that the spindle may make but a fraction of a revolution we must turn the crank a fraction of 40 turns; the actual number being found by multiplying the fractional turn of the spindle by 40. For example, let it be required to divide a gear blank into 73 divisions. We have by above $1\text{-}73 \times 10 = 10\text{-}73$ as the number of turns of the index crank, and such a division can be obtained by taking 40 holes in a circle having 73. 73 being a prime number it can only be obtained by special process to be explained later on.

The process of advancing the crank a given number of holes in a circle of a certain number would be rather inconvenient and rather uncertain, were it necessary to count the number out at

HOW TO GEAR A LATHE FOR THREAD CUTTING.

By F. E. Lauer

THERE is a constant ratio between the threads to be cut and the pitch of the lead screw, and that is easily obtained by dividing the pitch of the lead screw into the number of threads required, when the number of that is easily obtained b¼ dividing the lead screw, and when the number of threads is less than the pitch of the lead screw it is divided into the pitch of the lead screw as for example—16 threads required to be cut, 16 divided by a four pitch lead screw $=16\div4=4$ and again 2 threads are required with a 4 pitch lead screw, then 2 is divided into 4 giving a ratio of 2 to 1, when the number of threads required is greater than the lead screw, that is to say a finer pitch, the larger gear or gears are driven or placed on the screw and when the number of threads is less than the lead screw the larger gear or gears are the drivers or placed on the spindle. When the ratio is obtained it is only necessary to multiply both terms of the fraction by a figure that will raise the smallest term of the fraction to the number of teeth that is in the smallest gear, as for example 8½ threads is required to be cut, with a 3 pitch lead screw,

$$8\tfrac{1}{2}\times3=\frac{17}{2}\times\frac{3}{1}=\frac{17}{2}\div\frac{1}{3}=\frac{17}{6}\text{ and}$$

$$\frac{17\times4}{6\times4}=\frac{68}{24}$$

68 gear on screw

24 gear on spindle

or $\frac{17}{6}=2$ 5-6 ratio, snd 24×2 5-6 $=68$.

If the gears are not obtainable change the figure four to anything that will give the required gear, example 14 threads required with a 4 pitch lead screw, $4\div4=3\frac{1}{2}$ ratio; now any gear 3½ times to 1 will cut 14 threads, take a 20 and multiply it by 3½ and that will give you 70, 20 on the spindle and 70 on the screw or take 24 and multiply by 3½ and that will give another set $24\times3\frac{1}{2}=84$, 24 on the spindle and 84 on the screw. Another example required to cut 2 threads with a 3 pitch screw $3\div2=1\frac{1}{2}$, now any two gears $1\frac{1}{2}$ to 1 will cut required thread as $30\times1\frac{1}{2}=40$, or $45\times1\frac{1}{2}=60$, or again $60\times1\frac{1}{2}=80$, so it can readily be seen that any of these sets will cut two threads thus, 30 an d 40, or 45 and 60, or 60 and 80; now as two threads is less than the pitch of the lead screw, the larger part is the driver and is placed on the spindle, and the smaller on the screw.

Required 11½ threads with a 5 pitch lead screw $11\frac{1}{2}\div5=\frac{23}{2}\times\frac{5}{1}=\frac{23}{2}\div\frac{1}{5}=$

$\frac{23}{10}\times\frac{3}{3}=\frac{69}{30}$ gear on screw, or $11\frac{1}{2}$ threads with a 4 pitch screw is gear on spindle.

$$11\tfrac{1}{2}\div4=\frac{23}{2}\times\frac{4}{1}=\frac{23}{2}\div\frac{1}{4}=\frac{23}{2}\times\frac{3}{1}$$

69 gear on screw,

$=\frac{}{}$

24 gear on spindle, or again $11\frac{1}{2}$ threads with a 3 pitch lead screw $=11\frac{1}{2}$

$$\div3=\frac{23}{2}\times\frac{3}{1}=\frac{23}{2}\div\frac{1}{3}=\frac{23}{2}\times\frac{4}{1}$$

92 gear on screw.

$=\frac{}{}$

24 gear on spindle.

Always remember to find the ratio by dividing the number of threads by the pitch of the lead screw, providing the number of threads is greater than the pitch of the lead screw, and if less than the pitch of the lead screw, divide it into the pitch of the lead screw. It would not be necessary to find the ratio at all for we could do it thus, 16 threads required with a 4 pitch lead screw.

$\frac{4}{16}\times\frac{6}{6}=\frac{24}{96}$ gear on spindle, or 7 threads required with a 5 pitch lead screw.

$\frac{5}{7}\times\frac{4}{4}=\frac{20}{28}$ gear on spindle.

gear on screw.

It is necessary to get the ratio, however, so as to avoid confusion when compounding gears for fine or very coarse threads, for example thus, required 20 threads with a 3 pitch screw

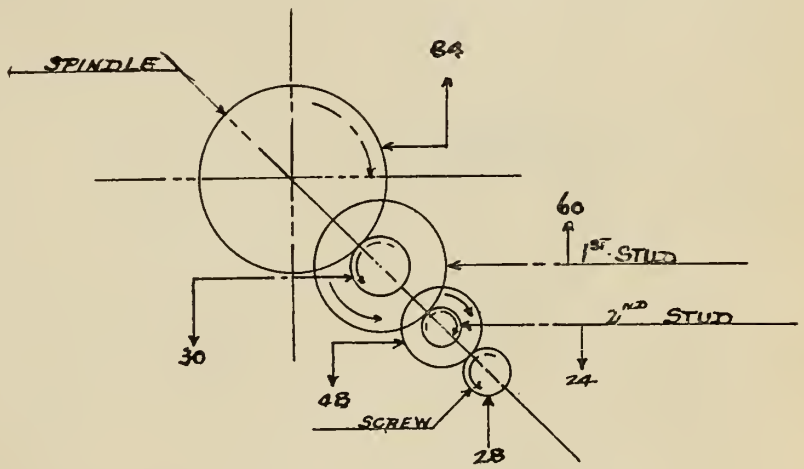
$20\div3=6\frac{2}{3}$; perhaps it will be found that we have no gear that is $6\frac{2}{3}$ to 1, then we divide $6\frac{2}{3}$ by anything that is sufficient to cut down the ratio to use the gears we have got.

$$6\frac{2}{3}\div3=\frac{20}{3}\times\frac{3}{1}=\frac{20}{3}\div\frac{1}{3}=\frac{20}{3}\times\frac{4}{1}$$

80 and 3 to 1 gives 30

$\frac{}{36}$ $\frac{}{90}$

and as the number of threads is greater than the pitch of the lead screw the small gears are the drivers and the large ones the driven and would be set us like this—30 gear on spindle driving a 80 gear on 1st stud, with a 36 gear driving a 90 gear on the screw. Suppose now we wish to cut a coarser thread than 1 per inch, then we find our ratio by multiplying the length of one turn by the pitch of the screw, and then compound thus, required one turn in 3 with a 4 pitch lead screw, then $3\times4=12$, which is our ratio, of course we have no gears that are 12 to 1, so we resort to compounding $12\div4=3$ which means that one set of gears 4 to 1, and one set 3 to 1, is required to cut the thread, and we get the following gears $\frac{4}{1}\times\frac{20}{20}=\frac{80}{20}$ and $\frac{3}{1}\times\frac{24}{24}=\frac{72}{24}$ now as one turn in 3 inches is courser than our lead screw, the large gears are the drivers and may be sei up thus—



Compound Gearing for Thread Cutting

80 gear on spindle driving a 20 gear with a 72 gear on the same stud driving a 24 gear on screw.

Going further and making a triple compound in event of not having the above gears we may add another stud and gear this way.

$12\div2=6$ and $6\div2=3$ and $2\times2=4$ and $4\times3=12$ our compounding must be right, and we may use the following gears: 2 to 1=24 and 48, 2 to 1=30 and 60, and 3 to 1=28 and 84 and, the gears would be set thus, in accordance with the sketch.

Mechanical Reviews

OPINIONS AND STUDIES WORTH NOTING

MAKING DRILL JIGS.

WE had a large number of drill jigs to make that could not be handled to advantage on any of the regular machines in the shop, so I decided to rig up a No. 5 Becker-Brainard vertical miller for boring the jigs.

A is the table on which the work is clamped, B is the cross slide, C is the scale guard, made of machine steel. It extends the full length of the table. The scale is secured to this guard at the most desirable angle. The overhanging ledge affords protection for the scale, lamp and vernier plate. The small T-slot that was formerly used for the feed stop is utilized to hold the scale guard. Directly under the ledge, a piece is fastened, forming a slot, into which the magnifying glass holder D is slid. It is so arranged that the glass may be used elsewhere or locked away when the machine is not in use. The glasses are swung on trunnions, and can be set at any angle by the small screw.

The bracket F fastened to the cross slide B supports the vernier plate G, and the lamp frame and the tube H also. The lower scale for the cross slide is embedded in the bracket I and knee J, and is protected by a loose slide piece K. The lamp tube is held by the plate L, and is supported at the outer end by the vernier bracket M. This is broken in the illustration to show the magnifying glass in position. The lower glass is mounted in the same way as the upper one.

Small incandescent lamps, 7-16 inch diameter by 2 inches long, are inserted in the tubes, the tube being slotted to direct a ray of light on the vernier plates only. The wires from the lamps run through the tube—part of which is shown—to a switch fastened to the side of the knee.

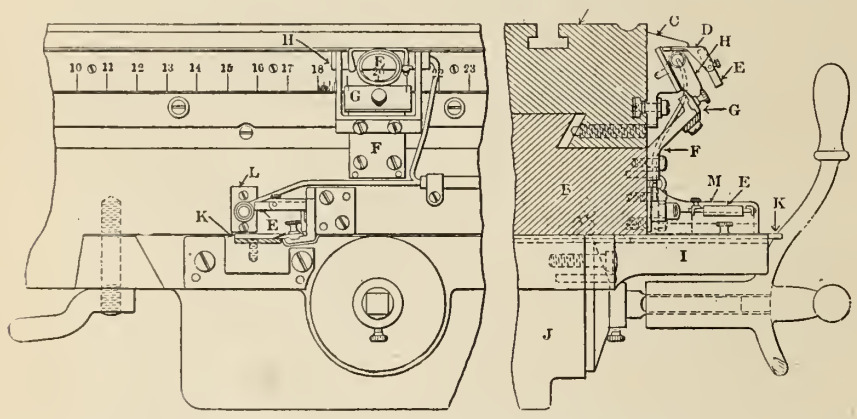
The scales are Brown & Sharpe make, graduated to 50ths of an inch with a vernier reading to 0.001. The table scale is about 42 inches long, and the cross-slide scale about 16 inches long, which gives a large range for jig work. The feed mechanism for the table and cross slide has been removed, not being required for this class of work.

The set of tools used with the machine consists of a reducing bushing, hardened and ground to receive a set of collets 3-6 to $\frac{3}{8}$ inch, a set of sizing reamers, to be held in the spring collets, a set of Morse taper-drill sockets, Nos. 1 to 4, an assorted set of boring bars, a center, a countersink and a feeler. All tools are held in place by the draw bar through the spindle, to the top end of which is fitted a hand wheel which greatly facilitates the handling of tools. The feeler is made about six inches long, hardened and ground to 7-16 inch diameter for about two inches of its length, and the rest of it is ground to 0.4 inch diameter. It is used to line up a job, also to locate the holes, registering from finished surfaces, half the diameter of the feeler being added to or subtracted from the reading, as the case may require.

If the feeler can be brought up to the straight surfaces in a jig to be registered from, it is not necessary to lay off the jig at all. The operator draws up a working chart, giving the location of the holes in decimals, so that the shifting can be done without any delay. If the feeler cannot be used, we simply put right-angled cross lines on the job, and use the center which is ground true, and run along the line, trying at different points and take a reading, then rub along the cross line taking the reading; coming back to both readings brings the centre directly over the intersection of the lines, regardless whether the intersection is seen or not. The location of all other holes on the same side is computed from the intersection reading. The countersink is first used, followed up by a short drill 1-32 inch smaller than the finished size, then the boring bar which bores within 0.0002 of finished size, and finally the sizing reamer, which is very slightly relieved. It is remarkable the way these reamers hold out. To my knowledge, a half-inch reamer has been used on about 500 holes in steel and cast iron, and still holds its size.

All holes set on angle lines are computed with the use of the sine and tangent tables. This in itself is a great improvement over the old method of using the faulty protractor. Holes on circular lines and different radii are bored on a circular table that is supplied with the vertical miller.

This machine has been in use a little over a year, and it gave such good results that another smaller machine was purchased, and equipped somewhat in the same way as the larger one, to take care of the smaller work. In conclusion I will say that it has brought about a decided change for the better in this branch of the trade. The present operator of the larger machine, who does all his own figuring, is a young man not yet twenty years of age, and is far from being a full-fledged machine.—W. A. in American Machinist.



Vertical Miller Fitted for Drilling and Boring Jigs

REPAIRING A FLY-WHEEL ARM.

WHILE moving one of the halves of a 17-foot fly-wheel, an arm was cracked at A (see illustration.) A consulting engineer suggested that the best method to fix the brake would be to braze the parts together. This plan was tried and proved successful, only the rim was distorted about one-half inch, as shown by the dot and dash line. In trying to remedy this latter defect the arm was cracked at BB.

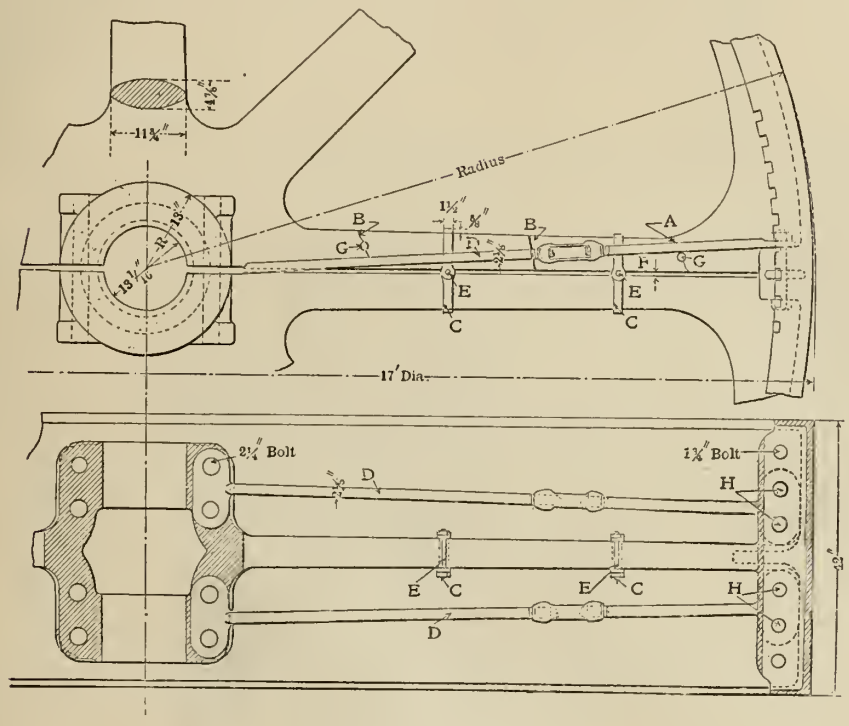
We finally fixed the break in this manner. Two wrought-iron rods were made $2\frac{1}{8}$ inches diameter, as shown at DD, and two pair of semi-rings, as shown at CC. First, the rings C were heated and placed in position and the pins E

driven in place ; the pins being slightly larger than the space F.

When the rings cooled off, they held the arm firmly in place. The pins G were then forced in position to help sustain the arm, and in order to see readily if the forces acting on the arm would displace same. The rods were put in position and by means of the turnbuckles the rim was drawn back to its right position.

Now to see if this manner of mending the arm is strong enough to resist the forces acting on it. The arms have to resist in tension the centrifugal force due to the rim and arms, the shearing at the hub due to the twisting moment and bending action considering each arm as a cantilever.

The tension strength of wrought iron is about three times that of cast iron of the same area. Assuming that the



Repairing a Fly Wheel Arm.

areas of the arms are strong enough to resist the centrifugal forces, one-half the area of arm, considering section an ellipse, is equal to

$$\frac{\pi \times 11\frac{3}{4} \times 4\frac{7}{8}}{8} = 22.5 \text{ sq. in.}$$

If the area of the rods is one third that of the arm, the rods will resist these forces.

⅓ of 22.5=7.5 sq. in.

Hence the area of one rod must be about 3.75 square inches. We used rods

R = radius of hub

R_a = radius of flywheel

N = number of arms = 7

I = moment of inertia of arm section

$$m_p = \frac{m\,(R - R_a)}{R \times N} = \frac{360{,}000 \times (120 - 12)}{102 \times 7}$$

$$= 45{,}380.$$

$$I = \frac{\eta \frac{7}{8} \times (11\frac{3}{4})^3}{64} = 385$$

Then the working fiber stress

$$f = \frac{\eta m_p \times y}{I} = \frac{45{,}380 \times 11\frac{3}{4}}{385 \times 2} = 700.$$

where y is one-half the width of arm.

There is another force acting due to the centrifugal force transmitted through the rods, that in the shearing of the bolts H. Calling the working tension strength of wrought iron 7000 pounds per square inch, a rod 2⅛ inches diameter will stand a load of 21,300 pounds. Assuming this load to be applied on the bolts H in shearing, on one bolt there will be a load of 10,650 pounds. The working shearing strength of wrought iron is 5000 pounds per square inch, hence, a 1¾-inch bolt will stand 10,500 pounds, nearly the assumed load on one bolt.

The factors of safety have been taken high in the above working stresses because the fly-wheel is in a paper mill which runs day and night throughout the week.

Another thing to be considered is the effect of the increased weight added to the fly-wheel acting as a counter-weight. It was thought at first that it might affect the engine, but it came exactly opposite the crank pin.

From this figuring it can be seen that the rods make the fly-wheel practically as good as new. It has been running for three years and up to the present there has been no trouble experienced nor any signs shown of its giving out.—Walter Bixby in Power.

BOOK REVIEWS.

THE A. B. C. OF PATENTS.—A synopsis of the patent trade mark designs and copyright laws in Canada and the United States with a short reference to patents in principal foreign countries. By F. B. Fetherstonhaugh, M.E. 32 pages, paper cover, price 50 cents, Toronto : The Carswell Co.

Volume 1 contains plain practical pointers to inventors, manufacturers and those interested in patents. It is intended to convey a clear idea of the law and rules relating to applications for patents, trade marks, designs and copyrights. It enables an inventor to intelligently understand what he is doing when applying for patent and what requirements are necessary in order to keep such patents valid. A praiseworthy feature of this book is its conciseness and clearness, showing at a glance the main features of the patent laws in the various countries and their requirements. To all interested in patents this book should not only appeal but be particularly valuable.

ELEMENTS OF GAS ENGINE DESIGN.—A reprint of a set of notes accompanying a course of lectures delivered at Cornell University in 1902, and notes taken from several of the American mechanical papers, by Sanford A. Moss, M.S., Ph.D. ; published by D. Van Nostrand Co., New York, in 1906 ; size, 6x4 inches with 197 pages ; cloth ; price 50 cents.

In this book all the fundamental principles of gas engine design are presented in condensed form, but no attempt is made to go into the detail mathematical and practical details. It is obviously intended to present in concise language and form the fundamentals of the subject with which all designers should be thoroughly familiar. The subject matter includes a general outline of the physics and chemistry of the gas engine, a discussion of gas engine fuels, a discussion of the action in a gas engine cylinder, and the finding of the size of the cylinder for a given power, the important principles of gas engine construction and rational formulas for most of gas engine parts, with constants derived from modern American practice.

Within its scope there is certainly a very complete and instructive book, and its conciseness is probably one of its best points.

Remember—It is only judicious workers who, knowing what are their powers, and using them with method and persisteney, make any real headway in life.

—Goethe.

Foundry Practice

MODERN IDEAS FOR THE TRADE.

RECENT FOUNDRY DEVELOPMENT.†

By H. Pilkington.

A DEVELOPMENT in furnace practice that has taken place recently, is the generation of power by means of the blast furnace gas engine. By this means very large quantities of power can be produced for use in operations quite external to the blast furnace itself. With the assistance of Mr. Thwaite I put down gas engines at Sheepbridge Works so far back as 1899, by means of which power was generated from blast furnace gas to operate a large new pipe foundry, and to-day the engines which, however, did not continue their operations. There is an enormous field for development in this direction, and the association will see a very notable installation at one of the works they will visit during their stay at Middlesborough.

By the use of blast furnace gas in internal combustion engines, there is a very great economy of gas used, the consumption being only about 110 cubic feet per I.H.P. developed, as compared with four or five times that quantity

Foundry Installation of Sturtevant High Pressure Blower.

power required for the production of some 600 tons of pipes and castings per week and the machine shops connected with them is wholly produced by means of blast furnace gas; the furnaces furnishing not only the power but the iron as well. This was probably the first successful installation for power production from blast furnace gas in this country. The small engines installed by Mr. Riley at Glasgow was indeed previous to this, but was used for electric lighting. There were at least two other

† Extract from President's Address before the British Foundrymen's Association, Middlesborough, Eng.

when used by means of steam boilers and steam engines.

As the average blast furnace produces about 170,000 cubic feet of gas per ton of pig iron produced, it will readily be seen what enormous sources of power are available. If the power required for the blast furnace operations were produced by means of internal combustion engines, probably half the gas produced could then be utilized for the production of power for other purposes. This suggests that in the future blast furnaces will become as it were, gas producers to plants required for turning pig iron into finished products, and that all finishing plants of whatever character in future, will be incomplete without blast furnaces to supply the requisite power to drive them.

This evolution would appear to be quite natural one when applied to the large iron and steel works of this country, some of which it will be our privilege to visit in Middlesborough, but to those who are also connected with foundry work in its largest developments, it appears that the application of this source of power will be by no means confined to steel works, but will also be applied generally as it has been, to foundry operations.

An ideal plant for large and heavy foundry operations might be described as having blast furnaces as its essential central factor, making pig iron, and producing gas in sufficient quantities to supply all the power required, the power being generated by means of gas engines working on the blast furnace gases, and either driving the machines direct, or generating electrical power and transmitting it to the various shops. All the foundry stoves could be heated with blast furnace gas. The pig iron could be run into ladles, passed through a mixer, kept hot by blast furnace gas, and the metal for the castings taken

from the mixer direct, without the intervention of a cupola in any shape or form ; thus, no fuel would be used about the plant except that put into the blast furnaces themselves for producing the pig iron. No electrical smelting plant of any kind could ever possibly compete with a plant of this nature. Pig iron used direct in this manner for making castings is an indefinitely superior metal in every way to that melted in cupolas, it is much softer and has a lower content of sulphur and manganese than the re-melted iron from the same stock.

The heavy increase in the production of iron at blast furnaces in recent years, has naturally reduced the cost of labor required to produce it, and this has been still further reduced by the almost enforced necessity for the mechanical handling of such large quantities of materials in a given time. In the case of pig iron, this has led to its being handled molten by means of ladles, either in connection with a mixer or a casting machine, or by handling it cold by means of electric cranes and breaking machines.

The most striking mechanical development, however, has been in the handling of the materials charged into the furnace top. The ores and fuel are dropped from hopper bottomed wagons by gravity into bunkers, from these they are also drawn by gravity into electrically propelled trolleys upon which they are weighed ; they are then delivered by these trolleys to the furnace skips into which they are dropped again by gravity. These skips are on an incline and are drawn electrically to the top of the furnace, where the materials are automatically dumped into the hopper placed over the top of the bell. There are no men on the top of the furnace, all the operations of hoisting and bell lowering being governed by means of levers operated by the trolley man at the foot of the incline.

With regard to the pig iron itself, perhaps the most notable development of recent years has been the application of the new science of metallography to the examination of the internal structure of the iron and the revelation it has made with regard to its different crystallizations according to the way it has been cooled down from the molten to the cooler state. May I point out with regard to this development that the examination of pig iron, by means of the microscope in order that we may examine its crystallization, is only a development of the judging and grading of it by fracture, the one is done by means of the microscope and the other by means of the naked eye. As there is a paper on the grading of foundry iron I will make no further comment except to say that it still appears that not only must the analysis be taken into account, but also the crystallization.

WHERE THE WORLD'S NICKEL COMES FROM.

ONE of the most valuable metals of commerce is nickel. Gold is where you find it—and so is nickel. Up to the present time, nickel is found only in two places—eastern Australia and in the region of Sudbury, Ontario. These Canadian nickel mines were discovered by accident, and for years went begging for recognition—no one seemed to know the metal had any value.

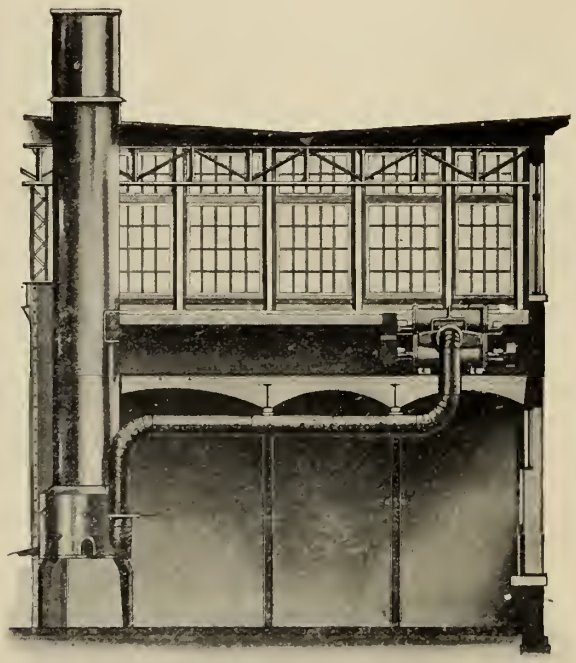
When the Canadian Pacific Railway was building its main line through Western Ontario, the graders cut through a rock formation carrying both copper and iron. This was a point north of Georgian Bay, now known on the map as Sudbury.

The per cent. of copper in the rock was small, running from two to three per cent., but it was sufficiently rich to warrant an attempt at development. The Canadian Copper Company was formed, and the Copper Cliff mines opened up. The ore was shipped, some to Wales, and some to the copper reducing works at New Jersey.

Combined with the copper, was another metal besides iron. No one seemed to know what it was. It was new to the experts, both at the mines, and at the reduction works. So the New Jersey smelter allowed it to run off with the slag. Not so with the Welshmen—they knew the metal and also knew its value. Like good business men they kept their secret and bought all of this particular copper ore they could get—the nickel was worth more than the copper—and it was clear profit. But the secret at last came out, and the Sudbury copper mines became the greatest nickel mines in the world.

The mines at Copper Cliff, a few miles from the present town of Sudbury, resembles the ordinary copper mines—the shafts have already reached a depth of 1,200 feet—and the nickel-copper bearing vein shows no sign of exhaustion. The Creighton mines, however, are like the mines of the Mesaba iron range—vast excavations where the steam shovel has laid bare acres upon acres of rich ore—there seems to be no limit to the amount. The ore runs about two per cent. copper, six per cent. nickel, 40 per cent. iron and the rest mostly sulphur. After reduction, a ton of ore will turn out about 120 pounds of nickel, which now bring 40 cents per pound.

The ore is partially reduced at the mines. It is crushed and screened, then spread out over vast beds of cord wood —acres in extent. Fire is applied, and the ore roasts for sixty days. This process drives out most of the sulphur leaving the metals in a form called matte. This matte is shipped to the refining works in Constable, N. J., where the nickel of commerce is made.



High Pressure Blower Connected to Foundry Cupola

USES OF THE BLOWER IN THE FOUNDRY.

NO device is more vital to the operation of the modern foundry than that by which air, under the requisite pressure, is supplied to the ig-

nited fuel within the cupola. Cupolas may vary in their proportions, and coal, coke and iron in their quality, but under no conditions can successful melting be accomplished without the employment of some device partaking of the nature of a blower. Although most important, this is by no means the sole purpose for which a blower is, or may be, employed in a foundry.

Under the broad term "blower" may be classed four types of machines, differing widely in their construction and operation.

First, the peripheral discharge fan wheel with enclosing case.

Second. The propellor or disc wheel, discharging its air in lines practically parallel to its axis.

Third. The so-called rotary blower with close fitting revolving propellors, and

Fourth. The blowing-engine, acting upon the principle of the plunger pump, and capable of producing pressures several pounds to the square inch.

Of these four types the second, or propellor type, is absolutely valueless for cupola work, because of its inability to produce the required air pressure, while the fourth, or blowing engine type, is too complicated and expensive for use in the ordinary foundry. For all purposes, except blowing cupolas, the fan blower is the only type which is adaptable.

According to the purpose for which they are designed, fan blowers may be classed either as volume blowers or pressure blowers, although one type naturally merges into the other. In either type the fan blower, proper, consists in its simplest form of a number of blades extending radically, or nearly so, from its axis and presenting practically flat surfaces to the air as they revolve. By the action of the wheel the air is drawn in axially at the centre and delivered from the tips of the blades in a tangential direction. It is therefore designated as a centrifugal fan, or, more properly, as a peripheral discharge fan.

If volume alone, regardless of pressure, is the requisite, the larger the fan the less the power required. There is a strong temptation, however, for a purchaser to buy a smaller fan and run it at a higher speed; for he sees only the first cost and does not realize the entailed expenditure for extra power. If possible, a fan should never be made so small that it is necessary to run it above the required pressure in order to deliver the necessary volume. To double the volume under such conditions requires eight times the power; three times the volume demands twenty-seven times the power.

For certain purposes, such as the blowing of cupola furnaces, a comparatively small volume of air is required, but under high pressure. For exhausting, blowing boiler fires, and the like, the volume required is greater and the pressure relatively less. The former wheel requires to be narrow at the circumference, thus providing for the escape of only a small amount of air. When a fan is employed for exhausting hot air or gases, the speed required to maintain a given pressure difference is evidently greater than that necessary when cold air is handled, the difference being due, and inversely proportional, to the absolute temperature.

First of all among the different types of fan blowers employed in the foundry is the pressure blower for blowing the cupola. The fan wheel is narrow, with tapering sides, reducing to the minimum width at the outer circumference where the air escapes from the wheel into the surrounding case. Numerous curved blades or floats serve, by their continuous action, to prevent the return of this air to the wheel centre, and thereby maintain the pressure due to their tip velocity.

There are many other uses of the fan blower in the foundry—uses in which it has no practical competitor. Employed as an exhaust fan, and properly designed for its work, it has found an extended application for removing the dust from tumbling barrels, from emery wheels, and, in fact, for exhausting dust, smoke or objectionable gases from any machine or apartment in which they are generated. For such work the fan is driven at comparatively low speed, and proper connection made to the space or spaces from which the objectionable matter is to be drawn. This passes through the fan and thence to any desired place of deposit and is discharged into the open atmosphere.

In the case of the pattern shop, which usually forms an adjunct of the foundry, a fan of this type in the form of a planing mill exhauster is usually of advantage for the removal of shavings and sawdust. The width of the wheel in such a fan is far greater both at inlet and outlet than that of a pressure blower wheel. A large volume of air at comparatively low pressure is thus passed through the fan with a minimum expenditure of power.

A similar typr of fan on a larger scale is used in connection with a steam-pipe heater for the heating and ventilation of the model foundry. By the concentration of all the pipe in a single heater across which large volumes of air are caused to pass, the amount of pipe is reduced to from one-third to one-fifth of that which would be required if it were strung around the foundry, as in the case of direct radiation. This concentration of the heating surface also serves to reduce to a minimum all possibility of freezing, renders the regulation of temperature as simple as is possible, and presents numerous other advantages. The heated air is distributed by means of the fan through a more or less extended system of underground ducts with vertical wall flues or of overhead galvanized-iron piping. The large quantity of air thus supplied secures adequate ventilation, causes all air leakage to be outward and serves to keep the foundry comfortable and clear of gas and steam during the heat, if cool or slightly tempered air be then supplied.

A similar form of apparatus, designed to deliver air at high temperature, may be employed for drying flask and pattern lumber, when the quantity is sufficient to warrant the arrangement.

Although the boiler plant in connection with an independent foundry is usually of somewhat limited size, nevertheless, the fact should not be overlooked that the fan blower is rapidly usurping the place of the chimney in the production of draft, or serving as its assistant in securing desired results. Applied to force the air into a closed ash pit creates a pressure which makes possible a high combustion rate, the burning of cheap fuel, and the attainment of the maximum capacity of the boilers. Employed as an exhauster, through which the gases are drawn, it, in addition, does away with the necessity of a high chimney. Under either form of application perfect control may be maintained over the draft pressure, and it may be automatically increased or decreased coincidently with a slight fall or rise in the steam pressure, which thus remains almost absolutely constant.

Either as a convenience or as a necessity the fan blower is ever in demand in the foundry, and its form of application are constantly increasing. It, therefore, stands to-day as a specific type of machine, whose general advantages and peculiar adaptability are becoming more and more familiar to every manufacturer and engineer.

A coal firm had a very stupid fellow to look after the yard, and so decided to discharge him because his stupidity entailed much annoyance and loss of time to the firm.

He was called into the office and told this, one of the partners remarking that he had actually learned nothing since entering upon his duties, upon which he retorted'

"One thing I have learned that I didn't know before."

"What is that?" asked the partner.

"That seventeen hundredweight makes a ton," was the reply.

On this ground he was not discharged.

Practical Questions and Answers

Increasing the Compression.

Ques.—In view of the fact that more power can be obtained from the same sized gas or gasoline engine by increasing the compression, what is the chief reason that the compression is not higher than common gas and gasoline engine practice allows?

Ans.—It is true that increasing the compression in a gas engine gives increased economy of operation, and not only can more power be obtained from a certain size of cylinder, but this power is secured at a smaller gas consumption per unit of power. The chief reason that the compression is not higher than practice at present dictates is that the higher the compression, the greater is the inflammability of the mixture, and thus the higher the compression is run the greater is the danger of pre-ignition, that is the premature firing of the charge.

Ordinarily gas engines to run on coal gas, are not designed for a higher compression than 110 pounds, compressions higher than that being liable to heat the charge to such an extent as to cause pre-ignition. Very recently, however, an English gas engine firm placed on the market an engine designed for a compression of 200 pounds, pre-ignition being prevented by drawing into the cylinder a small quantity of water during the suction stroke. This water absorbs heat from the walls of the cylinder during the suction stroke, and apparently is turned into steam. During the compression stroke the steam becomes superheated thus absorbing more heat. The result of the presence of the water is that the final temperature of compression is considerably decreased thus lessening the danger of pre-ignition.

An engine of the type tested by Professor F. W. Burstall, Birmingham University, and the test showed a very creditable efficiency.

The engine was of the electric lighting type with heavy flywheel; the cylinder was 14 inches in diameter, and the stroke of the engine was 21 inches; the engine was loaded by means of an all-round rope brake; the duration of the test was 6 hours and 45 minutes; coal gas was used with an average calorfic value of 578 B.T.U., per cubic foot at 60 degrees Fahr. and atmospheric pressure; the ratio of expansion in the cylinder was 8.7; the maximum pressure in the cylinder, as shown by indicator cards, was 528 pounds gauge; the average pressure during the suction stroke was 1.9 pounds below atmospheric. During the test the engine ran quite smoothly and without any premature ignitions or back explosions. From the observations during the test it would appear that the water behaves in the way before described, and that heat passes from the walls of the cylinder into the charge until a pressure of about 160 pounds is reached, when the heat seems to equilize; down the expansion curve the change appears to give up heat to the walls. The ratio of air to gas, as found from the exhaust gases, is 10.2. The heat was found to be spent in this way, re 37.4 per cent. indicated work, 29 per cent. rejected to the jacket water and 33.6 per cent.. This 37.4 per cent. is a very high indicated efficiency.

A few results of the test are as follows: average brake horse power, 49.7; average indicated horse power, 60.5; mechanical efficiency, 82.2 (which is not low when the type of engine is considered); gas per indicated horse power, 11.77 cubic feet at 60 deg. Fahr. and atmospheric pressure; gas per brake horse power, 14.43 cubic feet; thermal efficiency on the indicated power, 37.4 per cent.; thermal efficiency on brake horse power, 30.8 per cent.; water discharged from jacket per minute, 25.6 pounds; average rise in temperature of jacket water 77.5 deg. Fahr.; mean temperature of the exhaust, 381 deg. C; water passed into cylinder per minute 0.131 pounds; average percentage of carbon-dioxide in exhaust gas, 5.7 per cent.; average percentage oxygen in exhaust gases, 9.6 per cent.

Operation of the Injector.

Ques.—Will you please give me a practical explanation of the operation of the injector, or at least one with as little mathematical consideration as possible? J. K. A.

Ans.—It is rather difficult to give a comprehensive explanation of the action of the injector without entering into mathematical deductions. The author of the "Locomotive Up-to-Date" has attempted to give a practical explanation with some degree of success. He says:

The simplest method of considering the action of the injector is from a purely mechanical point of view, as an apparatus in which the force of a jet of steam is transferred to a more slowly moving body of water, resulting in a final velocity sufficient to overcome the pressure of the boiler. Consider, as a concrete example a boiler containing steam at 120 pounds pressure. According to the laws governing the flow of steam through properly built channels, the steam discharging through the minimum diameter of the steam nozzle into the atmosphere, or steam of lower pressure, will reach a velocity of about 1,400 feet per second, but when it discharges into a combining tube in which there is perhaps a 20-inch vacuum (which is not unusual), the velocity will be about 1,500 feet per second. In supplying water to the injector at the rate of 13 pounds to 1 pound steam, which is a fair performance at the pressure stated, the water will receive the impulse of the moving steam, condensing the later, and the two move along together through the delivery tube with a final velocity which is very much less than the original velocity of the steam jet. This final velocity, under the conditions named, is about 170 feet per second. In order that the injector should work properly, this velocity must be greater than that with which the water in the boiler would issue from the delivery tube under a pressure of 120 pounds per square inch, which velocity is about 133 feet per second. It will be seen, therefore, that there is a considerable margin of available energy in favor of the moving mixture of steam and water as against the "stationary" resistance, under the same pressure, of the water in the boiler.

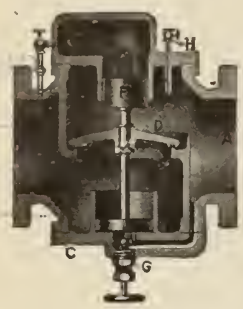
An injector must have the proportions of steam, water and delivery areas so designed that the velocity of the moving mixture of steam and water will be greater than the velocity at which a jet of water would flow from the boiler under the same pressure. If the weight of water supplied is too great, the steam will not have the power to give the water the required surplus of velocity; if there is an insufficient supply, the volume of the steam will not be sufficiently reduced by condensation to pass through the nozzles, and in neither case will the injector perform its functions properly.

Power and Transmission

Steam Gas Electricity Compressed Air Water

COMBINATION RELIEF AND BACK PRESSURE VALVE.

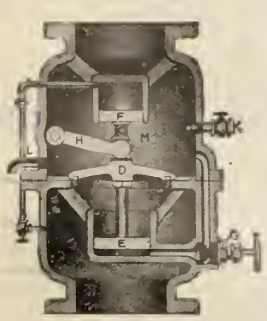
FOR plants running condensing in the summer months and utilizing their exhaust steam for heating in winter, the combination relief and back-pressure valve is designed. The illustrations show both the vertical and horizontal



Eclipse Horizontal Combination Valve.

type, as manufactured by the John Davis Company, Chicago.

When used as a back-pressure valve the controlling valve G is opened, which equalizes the pressures upon the top of the main valve D and beneath the piston E. The valve is then held to its seat by its own weight and by the weights upon the lever attached to the rod carrying the arm H. The piston F acts as a dash-pot to prevent violent action. When a back pressure exceeding five pounds per square inch is desired, a by-pass P is provided, allowing steam from the high-pressure side to act on the piston F, assisting in holding the



Eclipse Vertical Combination Valve.

valve to its seat, and avoiding the necessity of excessive weights on the lever. Should the valve show any tendency to chatter, the controlling valve G may be adjusted so as to dampen the action, and is so sensitive as to control the pressure within a fraction of a pound.

When the system is run condensing, the controlling valve G is closed, making the piston E act like that of a vacuum dash-pot. The weights are removed from the lever, and on the loss of the vacum the valve is raised from its seat by the steam accumulating below it, allowing the engine to exhaust into the atmosphere. The combined action of the two pistons prevents the valve from slamming with the pulsations of the exhaust. The valve is sealed against air leakage by admitting water through the valve K, in an amount sufficient to maintain a slight drop at L. The working parts, including the valve seat are of bronze and the valve is babbitted.

COMPRESSED AIR FORGES.

THE use of compressed air for producing the blast in portable riveting forges has recently been developed by the Canadian Buffalo Forge Co., Montreal. One such application is shown in Fig. 1. In this design the air is admitted by a needle valve through two brass nozzles into a cast iron mixer nozzle and thence direct into the tuyere. The action resembles that of a steam injector, free air being drawn in to augment the volume. By the use of this needle valve, the volume of air furnished is varied without affecting the pressure, and by the compounding of the injector action, the volume of compressed air required is reduced one-half. Another application, in which the compressed air acts directly upon the blast fan of the forge, is shown in Fig. 2.

Extensive experiments show great economy in using the jet of air direct into the tuyere, as described above. For example, it is stated that it takes one-ninth the amount of air to operate a forge in this manner, that it does to operate the fan forge with compressed air, as in Fig. 2, and it takes one-fortieth as much as it does to operate the free air forge with an ordinary blower. The pressure required is not high, in fact very low pressures have been used advantageously.

The wide application of these forges for use on bridge and building construction, in large railroad and repair shops, and in fact wherever compressed air is available, will readily be appreciated, and the saving of time and labor in their usuage, as well as the ease with which they may be connected by a small hose to the compressed air, should appeal to users everywhere. Although the Buffalo Forge Company makes both forges mentioned above, it recommends the compound compressed air operated on

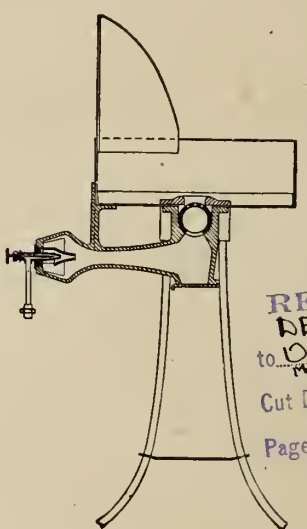


Fig. 1 — Buffalo Compressed-Air Injector Type Forge.

the injector principle, Fig. 1, because of the greater simplicity, economy and more rapid heating obtained.

THE ABUSE OF VALVES.

A LARGE number of valves are returned to the manufacturers in the course of time by purchasers, who claim that the valves are defective in workmanship and not tight, says the Valve World. The

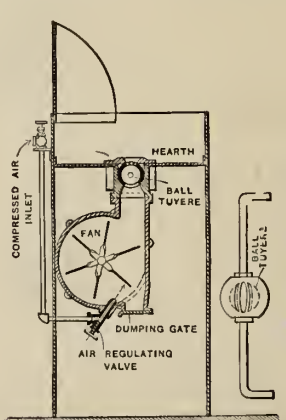

Fig. 2—Buffalo Compressed Air Driven Fan Forge.

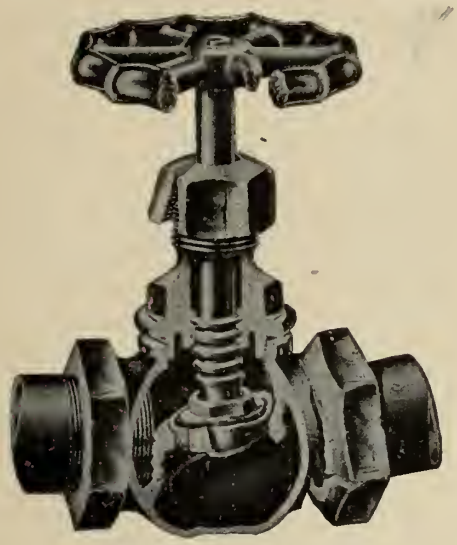
manufacturer is not only requested to credit the valves returned, but must bear the expense of taking valves out of lines and putting them back, the carrier's ex-

penses both ways and also the criticism and injury to his reputation.

When the goods claimed defective are received and have been submitted to the most careful examination and tests, it has been found that in ninety-five cases out of a hundred the valves leak on account of the abuse and carelessness of the parties who installed them.

It is a very easy matter for a practical valve maker or a good steamfitter to determine when and just how a valve has been abused, and if customers would take a little pains to examine leaky



Abuses of Valves Illustrated.

valves before returning them, they would find that the valves had been abused by their own men.

Anyone who has done considerable steamfitting work should be able to determine for himself whether a valve had been abused, or would have in his employ someone capable of doing this, and be able to remedy the trouble without annoying the manufacturer with it.

The following are a number of reasons why valves leak after being placed in a pipe line:

1. We are confident that ninety per cent. of all the trouble with leaky valves arises from the improper use of cement, and from the failure to remove the particles of cement, scale, chips, dirt, etc., that naturally get into the pipe while it is lying around a building and then lodge on the valve seat after steam is turned on. When applying cement, it should be put on the male part only, for if placed on the female part, it goes through the pipe and gets on the valve seat. In any case much more cement is used than is really necessary. If steamfitters would take pains to apply the cement as above directed, and also make sure the pipe is clean by standing it on end and striking it a few times with a hammer, before putting it into place, in order to loosen any scale or dirt that may be inside, an immense amount of trouble would be avoided. As a further precaution, it is well, when a job is started up, to open all the valves throughout the building and blow the steam through them thoroughly. After doing this properly there will be very little material in the pipes to cause trouble.

2. It occasionally happens that threads on pipe are cut longer or smaller than standard, in which case, if the pipe is screwed into the valve, it very likely will run up against the partition and injure it.

3. In the lighter class of valves, one of the common abuses is the application of a pipe wrench on the opposite end of the valve from the end which is being screwed on the pipe. This should never be done, as it invariably springs the valve and of course causes it to leak.

4. If a light valve is put into a vise for the purpose of removing the centrepiece, the valve should certainly be clamped lengthwise. In all cases when removing centrepiece care should be taken to have the disc some distance from the seat, as otherwise the disc will be forced onto the seat and some part of the valve become strained. Never use an old strained monkeywrench on a centrepiece, as such wrench is quite likely to squeeze the corners of centrepiece out of shape. If found impossible to remove the bonnet or centrepiece by ordinary methods, heat the body of the valve just outside the thread with a blowtorch, or any other available means that can be applied to the body and not to the centrepiece. Then tap lightly all around the thread with a soft hammer. This method never fails, as the heat expands the body and breaks the joint made by the litharge or cement.

5. Often when a stuffing-box leaks, a steamfitter will endeavor to stop the leak by straining the stuffing-box with a large wrench, when the difficulty is due to the packing having become worn out and needing to be renewed.

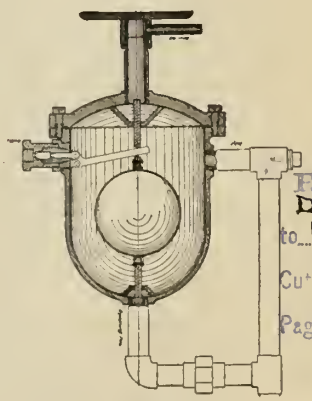
6. It sometimes happens that when a valve is to be used on a header, the steamfitter will start out with a long piece of pipe that is unsupported, and, through carelessness, will allow the strain of the pipe to come on the valve, thereby springing it.

7. Serious trouble is also likely to occur in a pipe line where light valves are used through the fitter not making proper allowance for expansion and contraction and allowing the strain to be thrown on the valves. The pipe and fittings are much more rigid and stiff than the lighter brass valves, and in consequence the expansion strains will relieve themselves at the weakest point, unless otherwise provided for. A very good example of this is illustrated in most high buildings heated by steam, where it is difficult to take care of the expansion. The steamfitter will branch out of his riser with a feed pipe to radiator. The radiator will have high legs and the air valve end usually stands close to the riser. He runs this branch (from three to six feet in length) underneath the radiator to the front end, and usually connects same to the radiator valve by a short nipple. This cross piece or branch under the radiator is supposed to take up the expansion and contraction of the riser, which may expand from one-half inch to one and one half inches. He does not appreciate the fact that the ordinary light angle radiator valve is the most flexible of all the connections and will spring or distort itself before anything else in the branch.

8. Very often, when a valve leaks, some one will stupidly undertake to tighten it by using some kind of a lever on the wheel. This should never be done as it will in all probability injure the valve. As the trouble undoubtedly is due to the presence of dirt in the valve it is very much better in such cases to take the valve apart and clean the seat.

THE BURROWS STEEL TRAP.

THE simplest device for trapping water from a steam system is a float with the valve directly attached to it. The movement of the float is, however, a great deal more than is required for the valve, and this greater movement can be utilized through a



Burrows Steam Trap.

proper leverage to overcome a greater force through a shorter distance.

This is what has been done in the trap under consideration. The float, instead of lifting the valve directly, lifts a horizontally disposed lever to which the valve is attached, and is thus able to open a larger valve against a given pressure or to handle a smaller valve with greater positiveness. An equalizing pipe prevents the trap from becoming air-bound. The Burrows Manufacturing Company, 73 Warren Street, New York, is the manufacturer.

ABOUT CATALOGUES

By mentioning Canadian Machinery to show that you are in the trade, a copy of any of these catalogues will be sent by the firm whose address is given.

TYPE "S" MOTORS. Circular No. 1068, illustrating and describing type "S" D. C. dynamos and motors. It is a 15 page bulletin, well illustrated.

AUTOMATIC CONTROLLERS. Circular No. 1136 of the Canadian Westinghouse Co., Hamilton, illustrating their automatic controllers for direct-current motors.

DIRECT-CURRENT MOTORS. Circular No. 1138, of the Canadian Westinghouse Co., Limited, Hamilton, illustrating and describing two types of their direct-current motors.

S. & S. ENGINEERING CO. A pamphlet illustrating the S. & S. variable speed countershaft. Canadian branch of the S. & S. Engineering Co., is at 255 Jackson St. West, Hamilton, Ont.

METAL WORKING MACHINERY. A bulletin catalogue issued by the Fitchburg Machine Works, Fitchburg, Mass., describing on separate sheets the wide variety of lathes as manufactured by this company.

FINISHING FLYWHEELS. Single leaf bulletin, issued by the Gisholt Machine Co., Madison, Wis., illustrating and describing the methods of automobile engine flywheels on Gisholt lathes.

ATLANTIC OIL COMPANY. A prospectus of this company is issued from Toronto, Ont., giving information regarding the company and the properties which it proposes to work in British Columbia.

RHEOSTATS. Circular No. 1139, of The Westinghouse Electric & Mfg. Co., Pittsburg, Pa., descriptive of the construction and operation of their standard starting and field rheostats. It is a 17 page circular, well illustrated.

STERLING HACK SAWS. A circular and booklet describing the Sterling power hack saw, manufactured by the Diamond Saw & Stamping Works, Buffalo, N.Y. Some pointed paragraphs are given revalent to the Sterling saws.

STEEL SHEET PILING. A catalogue and circulars dealing with the interlocking steel sheet piling, made by the United States Steel Piling Co., Chicago, Ill. To engineers and contractors this catalogue should prove of very decided interest.

BRICK MACHINE. Catalogue describing the process of manufacture of sand-cement pressed brick, advocated by The McIntosh Brick Machine Co., Goderich, and illustrating and describing the machine built by them for the manufacture of sand-cement brick.

ENGINEERING WORK. Section A of the engineering work catalogue of The Wellman-Leaver Morgan Co., Cleveland, O., containing very handsome illustrations and short descriptions of engineering works which have been carried out by this firm. It is 12 x 9 ins.

WATER COOLING. The De La Vergne Machine Co., foot of East 138th St., New York City, has just issued a folder describing the Klein water cooling tower built by them. These towers will cool the water to from 5 to 15 degrees below the temperature of the atmosphere.

BUILDING BLOCKS. Catalogue in which is described the Huennekes system of making sand-lime brick and building blocks, as owned by the Standard Brick Machinery Co., engineers and contractors for the erection of sand-lime brick plants, 114-118 Liberty St., New York.

AUTOMATIC VISES. A pretty little art calendar describing vises manufactured by the Pittsburg Automatic Vise & Tool Co., Pittsburg, Pa. Illustrations are given of the different styles and patterns of this vise. The smaller illustrations in this booklet showing its many adaptations.

CHAMPION. An art booklet devoted to the Champion automobile repair kit manufactured by Patterson, Gottfried & Hunter, 146 Centre St., New York. Each page contains a descriptive verse, the whole dealing with the automobilists fight when not provided with one of these repair kits.

ENGINEERS' CATALOGUE. The New York Belting & Packing Co., Limited, who are represented in Canada by the Economical Mfg. & Supply Co., of Toronto, issued this catalogue. It is devoted to the many styles of packing and belting manufactured. 48 pages, 3½ by 6.

MOFFATT FUEL SAVER. A 19 page catalogue showing the application of the Moffatt fuel saver to furnaces, and giving information concerning same. A number of highly complimentary testimonial letters are shown, together with a list of the users of the Moffatt fuel saver in Ottawa and vicinity.

COLD HARD CASH. This is the striking heading of a folder issued by the Canadian Casualty & Boiler Insurance Co., 22-24 Adelaide St. East, Toronto. It gives a lengthy list of names that will testify to the promptness of claims being paid by this company. In each case the amount of claim paid is given.

TAPS AND DIES. The general 1906 catalogue of Butterfield & Co., Rock Island, Que., manufacturers of screw plates, taps and dies, and reamers, etc. The catalogue is a very complete one, being well illustrated and containing specifications and price list of the tools. It contains 84 pages, 6 x 9 inches.

TECHNICAL THERMOMETRY. General catalogue of the Cambridge Scientific Instrument Co., Limited, Cambridge, Eng., being a descriptive catalogue and price list of all kinds of heat measuring instruments made by this firm. The catalogue contains 62 pages, 8½ x 11 inches, and is very complete.

RIVET MACHINERY. Standard sized catalogue dealing with "cold process" automatic bolt, nut and rivet machinery built by the Waterbury Farrel Foundry and Machine Co., Waterbury, Conn. This catalogue is profusely illustrated, and contains short descriptions and specifications of each machine illustrated.

STEAM SPECIALITIES. This catalogue is from the Canadian office of which William N. Courtnay is manager, at 113 Temple Bldg., Montreal. Greenway separators are described and illustrated to some length. The various types in use being shown further illustrated, in many cases showing the diagrams necessary for these separators.

THE RUSSELL. A well illustrated catalogue devoted to the Russell motor car, manufactured by the Canada Cycle & Motor Co., Limited, Toronto Junction, Can. The mechanism of the motor comes in for considerable attention, the various parts being well illustrated and described. Different types and models are shown exhibiting the variety of cars turned out by this company.

SAND LIME BRICK. Catalogue issued by the American Sand-Lime Brick Co., Chicago, illustrating and describing the American system for making sand-lime brick. The catalogue, besides containing an interesting description of the process of manufacture of the brick, has full page illustrations of the interior and exterior of many plants scattered throughout the States where these brick are manufactured.

FIND HORSE POWER. Chart issued by Sadler & Haworth, of Montreal, to immediately determine the horse power of a certain width belt running at a given number of revolutions. It also enables a person to find the feed required to transmit a certain horse power with a given width belt. The operation in doing this is confined to the revolutions of a circular disc. It is a handy little article for anyone requiring to find horse power in belt transmission. A card dropped to this firm will bring one of these to any one interested.

MODERN MACHINE TOOLS. Superior to any attempt previously made in Canada in its line is the beautiful catalogue just issued by the John Bertram & Sons Co., Limited, Dundas, containing 255 pages, 9½ by 12½. The illustrations are all a work of art, and reflect credit not only on the engraver but on the photographer and the compiler of the catalogue. The frontispiece contains a bird's eye view of the Bertram Works as they will appear when plans already under way will have been completed. In the introduction mention is made of the story of the development of this firm since 1861, that from a humble beginning it has become the largest working machine tool plant in Canada. The catalogue is divided into sections, showing the separate classes of machinery. No other concern in America make a wider range of machine tools than John Bertram & Sons. The range is too wide and varied to permit of even bare mention here. A specialty of this firm is heavy tools for locomotive and car shops, and for these particularly the firm has a world wide reputation. As a catalogue of machine tools it is very extensive and full of information. As a work of art from the view point of the bookbinder it is superb.

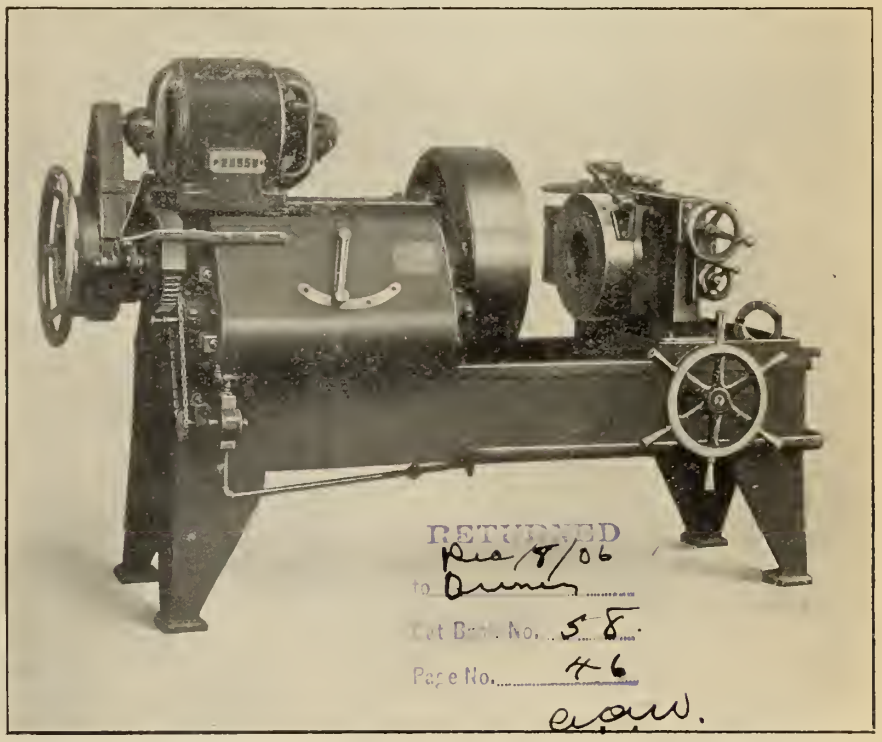
Metal Working ***Special Apparatus*** ***Wood Working***

4-IN. MOTOR DRIVEN MACHINE.

ILLUSTRATED herewith is a four-inch motor driven pipe cutting and threading machine, manufactured by the Stoever Foundry and Manufacturing Co., Myerston, Pa. While the motor driven machine is shown, all speeds being obtained in the gearing, there is but little difference between the belt and motor driven types. To equip the machine for motor drive, the belt pulley is removed and a sprocket wheel for the chain put in its place. The motor table is placed above the main bearings as shown, and by the addition of the motor and the chain, the equipment is complete.

It will be readily seen, that this method of motor drive has great advantages. In the first place, it renders an easy change from a belt drive to a motor drive at any time, and the motor driven machine has all the advantages of speed which are obtained in the belt driven machine, and without the extra expense and necessary waste of current which accompany the use of resistance boxes and controllers. With this design of drive, a constant speed motor is employed, which is the least in first cost and the highest in efficiency in operation. A variable speed motor could of course be used if anyone wished to do so, and an additional range of speeds would be secured. The machine is of exceedingly substantial construction throughout—a departure from the older practice has been made in making the headstock in one casting, following the usual lathe construction. The gearing is all on the outside of the machine, and readily accessible for any purpose. An innovation in pipe threading machinery is the use of an internal gear drive, which is exceedingly powerful, very compact, and, of course, very safe, as the teeth are carefully protected.

The machine has twelve (12) speeds, the shifting gears in the gear box giving four (4) speeds, and the clutch on the machine three (3) for each one in the box. These speeds can all be very quickly obtained, and the change is more easily made than when shifting a belt on a cone pulley, and making the additional gear change required in older machines. The gripping chuck of the machine is of the universal type. All of the interior parts are made of steel; the gripping jaws are made of tool steel carefully hardened—there are three (3) jaws. The rear chuck is also of the universal type with three (3) jaws, its function being to simply centre the pipe, holding it in line with the die head. The large hand wheel on the outer shell of this chuck enables it to be very easily operated. The oil for lubricating the dies is furnished by a rotary geared pump of the best construction, driven by a steel chain from a constant speed shaft on the machine. There can be no slip, and there must be a positive supply of oil delivered at all times. The actual amount used on the dies and cutting-off tool, is regulated by valves at the proper points, and the relief valve takes care of any excess.

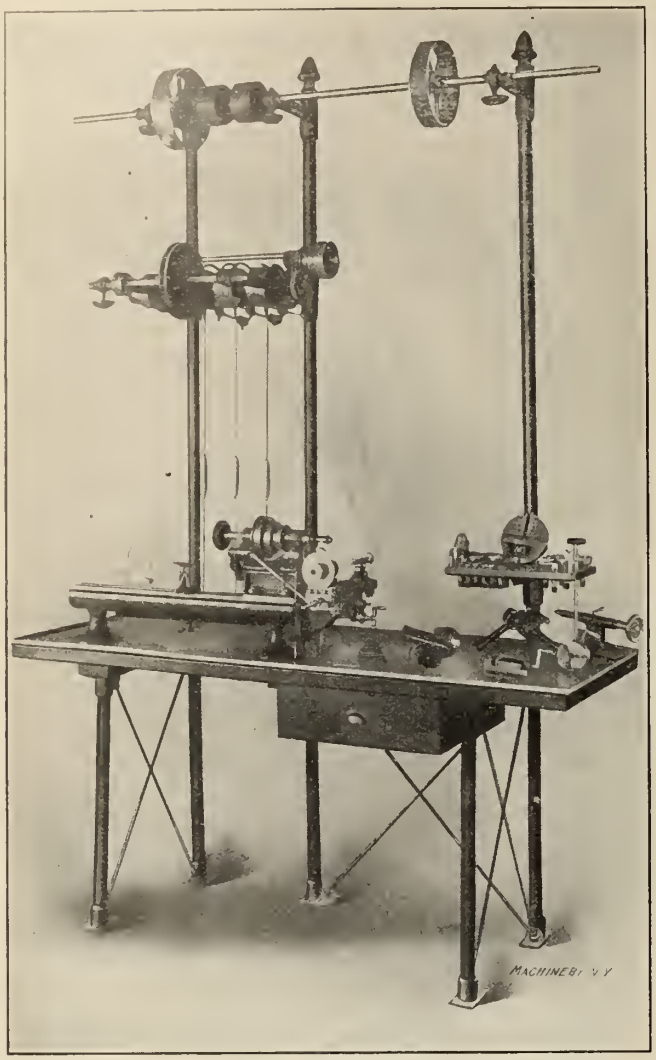


A 4-in. Motor Driven Pipe Cutting and Threading Machine.

The die head has been greatly improved by the substitution of interchangeable hardened steel cams, for those of cast iron construction commonly used in other machines. This not only ensures a much greater life and accuracy for the head, but if, for any reason, it should become necessary to replace a cam, it can be very easily and cheaply done. In addition to these hardened cams, hardened steel plates are placed in the bottoms of the die slots. These ensure a permanent bearing for the back edge of the chasers, and therefore keep the lead correct, which is a very important point. The sliding head has been adopted for the regular design, as it offers many advantages over the older type of stationary head. One advantage lies in convenience often secured by placing pipe in the machine through the die head, in which case the head can be pushed out of the way and the pipe pushed through the opening in the stand without injuring the dies. The gr?atest benefit, however, lies in the fact that the head is movable—floating to a certain degree. As there is a certain amount of eccentricity to be found in all pipe, a great strain is brought on the dies when used in a rigid head, but by making the head movable it will adjust itself to the eccentricity of the pipe as it revolves. This not only relieves the head of unnecessary strain, but ensures a more equal depth of thread round the circumference of the pipe. The slides for cutting the pipe while cutting off, and which are placed on the back of the stand, are unusually heavy,

and faced with hardened steel plates for guiding the pipe. The cutting-off tool is held on one of these slides, and the reaming tool is also held on the same slide. The bed is made of special construction to ensure unusual stiffness between the headstock and the opposite end. The oil reservior is in the bed, and a smaller supply than usual is used for necessary lubrication.

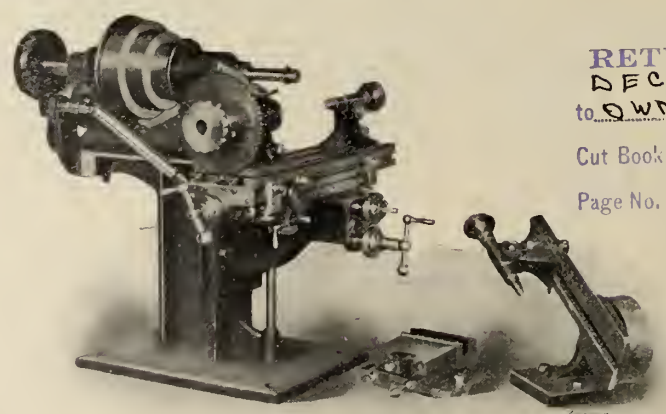
It has been the endeavor to design a machine which will be simple in the arrangement of its parts, thoroughly accessible, and easily and cheaply repaired in case of accident. The machine weighs complete with equipment about 3,200 lbs.



Milling Attachment for Bench Lathe.

BENCH MILLER AND MILLING ATTACHMENT.

ONE of the illustrations represents a new bench milling machine which consists in part of some of the attachments for the Cataract bench lathe. The table of this miller drops 7 inches from the centre of the main spindle, is 12 inches long and has power cross feed when driven by the regular screw cutting attachment used for the bench lathe. All feed screws are supplied with 1½ inch index reading in thousandths, constructed the same as for the slide rest of the lathe. The machine is obviously very useful in getting out die and jig work. The main head is the same as is used for the No. 3 Cataract lathe, the spindle having 1-2 inch capacity clear through. The dividing head measures 2 1-2 inches to centres and has a 4 inch index plate. It admits the No. 3 chuck, thus interchanging with the head. The same dividing head is used in connection with the adapter shown to the right with a footstock in place, this enabling one to get any angle of head to 45 degrees. It is especially suitable for small taper tap work as the footstock can be kept in proper alignment. A vise is made for this miller, adapting it to a variety of small work. A milling attachment for the same bench lathe is shown in Fig. 2. This is identical with the bench miller with the exception of the main frame. The proper height for the frame above the bench is obtained by raising the head 3 inches above the top of the bed. As will be noticed, the apparatus is shown as used with the combined bench and countershaft arrangement as illustrated. The countershaft with this arrangement is carried by the gas pipe uprights and has two cones whose shafts are connected by a pair of gear. The cone for driving the milling attachment being 3 inches higher than the one for the lathe head, so that one can take the head from the lathe and place it upon the milling machine and still retain the same length of belt. As the same countershaft, lathe head, and screw attachment are used as with the lathe, the attachment for milling can be applied quickly. The shifting of the countershaft belts is accomplished by the rods at the rear, but foot treadles can be used where desired. The countershaft brackets carry also a splined shaft for a high speed grinder pulley. Where required, the countershaft can be made to go on the wall in the usual fashion instead of on the 1 1-4 inch gas pipes.



Cataract Bench Milling Machine.

The manufacturers are Hardinge Bros., Chicago, Ill.

CHAMPION 14-IN. ENGINE LATHE

ADDITIONAL weight and rigidity, due to the extensive use of high speed steel tools, is the feature that characterizes the new standard 14 inch engine lathe, built by the Champion Tool Works Co., Cincinnati, Ohio.

The automatic stop for the longitudinal feeding mechanism, is an interesting

Fig. 1—The New Standard 14-in. Engine Lathe.

feature. It may be set to and in any position of the carriage. The feed rod carries two adjustable collars, one on each side of the carriage, which, when encountered by a pin, which is part of the carriage, cause the lateral displacement of the rod. Such a movement in either direction disengages a clutch in the driving gear, on the feed rod in the gear box near the head end of the lathe, and the feed ceases. Normally the feed rod is held with the clutch engaged by two spiral springs, and on the feed rod. In this central position a key extending through the rod has its ends engaged by diametrically opposite notches on the inner circumference of a ring, which is integral with the gear. There are three sets of these notches, so that the clutch may be engaged at six different points in a revolution. The gear is otherwise loose on the feed rod. The clutch ring is held intact with the gear by the cap and the screws. The loose parts, gear and cap, are held against lateral movement by fixed parts of the containing case.

In the box is a nest of three gears, giving three different speeds to the feed screw. One or another of these gears is made active by a plunger and dive key, not shown on the detail. The plunger handle, however, may be seen on the exterior view given in Fig. 1.

The head spindle of the lathe is made from hammered crucible steel, and has a 1 9-16-inch hole bored from the solid stock. It is accurately ground and mounted in phosphor bronze boxes. The head and tailstocks are of large proportions, the latter being of the now common form in which clearance is allowed, so that a compound rest can be set at an angle, and it has a graduated base so that it may be set over for taper turning. The spindle centers are adapted for a No. 3 Morse taper, and the head center is bushed. The feeds can be reversed from both the apron and the head, and the arrangement is such that the rod and screw feeds can not engage at the same time, eliminating the danger of breaking apron parts. Cross and longitudinal feeds are provided, and all of the feeds are gear-driven, as has been indicated, with three changes of feed and thread, and an unlimited range of feeds and threads is possible by using additional change gears on the outside, between the spindle and the gear box.

A DECK CAULKING TOOL.

USUALLY the method of caulking the wooden deck of a ship is by hand. It is expensive as well as laborious, and in recent years has given way, to a considerable extent, to more expeditious methods, which involve the use of machinery. A neat tool for this purpose has recently been placed on the market. It is known as the Thor pneumatic deck caulking tool, and is constructed by the Independent Pneumatic Tool Company of Chicago and New York.

The accompanying illustration needs little explanation. The apparatus consists essentially of two parts, the feeder and the hammer. The latter is a standard pattern pneumatic hammer which is made by this firm. The feeder is made of cast steel, and is arranged to be fitted to the rest of the apparatus by means of a steel pin, which passes through a double eye-piece, through which the power of the hammer is transmitted. To minimise injury to the bearings owing to the action of the blows, a rubber cushion is placed in each eye-piece and also in each eye of the holder. These can be seen in the drawing. The pin acts as a spindle for the caulking discs, of which there are three kinds. The seam opener is used to open the seam to the required width to receive the oakum. Then the caulking tool is employed to insert the first caulking thread. Finally, two threads of oakum are caulked down on the top of the first thread by means of a third tool, called the maker. The oakum is laid down on the seam in long lengths, and one end threaded through the nose of the feeder, as shown in the illustration. As the feeder is

moved along, the oakum is automatically picked up. The machine is capable, so it is claimed, of doing much more work than it is possible to do by hand with ordinary tools—in fact, it is said that two apprentice carpenters can caulk 90 feet a day with two tools. Further, the firm states that for drumming decks one apprentice can do 900 feet in one day.

Caulking Deck Pneumatically

THE FORGING QUALITIES OF ALUMINUM BRONZE.

FOR both hot and cold working, no copper alloy can approach aluminum-bronze. In this respect it even surpasses copper itself as it is not so apt to crack during the operation. The yellow metals composed of copper and zinc are quite soft while red hot, but at a black head are brittle and crumble to pieces when attempts are made to work them at such a temperature. This fact frequently renders the hot working of the copper and zinc alloys a troublesome process. Aluminum-bronze, however, is not subject to this "black-shortness" and, therefore, it may be worked hot with as much facility as good Norway iron. Those who have had a limited experience with aluminum-bronze may not agree with this statement, but it is, nevertheless, true and those who have had trouble in rolling or forging aluminum-bronze on account of the cracking during the operation will sooner or later discover that the cracking is not caused by the nature of the aluminum-bronze itself but from having been poured at too high a temperature or from impurities in the metal.

The strength, homogeneity, non-corrosive properties, and forging qualities render aluminum-bronze an alloy which has never been equalled and for many uses it is unquestionably the best material. It does not seem to be subject to the phenomenon of crystallization so prevalent in the brasses and as far as non-corrosive properties are concerned it is the equal of any of the bronzes.

In 1894 the War Department, through the United States Board of Engineers, decided to adopt 9 per cent. aluminum-bronze for the foundation bolts of the new mortar batteries then about to be erected along the coast

The bolts that were used by our Government for the purpose of anchoring the gun carriages at the various batteries along the coast, were 2 in. in diameter and 6 feet long. The aluminum-bronze was made of Lake copper and pure aluminum in the following proportions: Copper, 91 lbs.; aluminum, 9 lbs. No zinc, tin, or other metal was added and a flux of common salt was used on the copper while it was melting. The aluminum-bronze was cast in a 4 x 4 square billet and 40 inches long. The casting was made in an iron mold and poured from the bottom so that the billet would be free from dross. The billets were rolled hot in one heat to the required diameter of 2 inches. After the rods were rolled, a head was upset on them in the regular manner practiced in heading a wrought iron bolt. In the illustration is shown the perfect head which it was possible to make on these bolts. A thread was then cut on the other end of the rod and the bolt was ready for use.

These bolts had a tensil strength of over 60,000 lbs. per sq. in. as the following test will indicate:

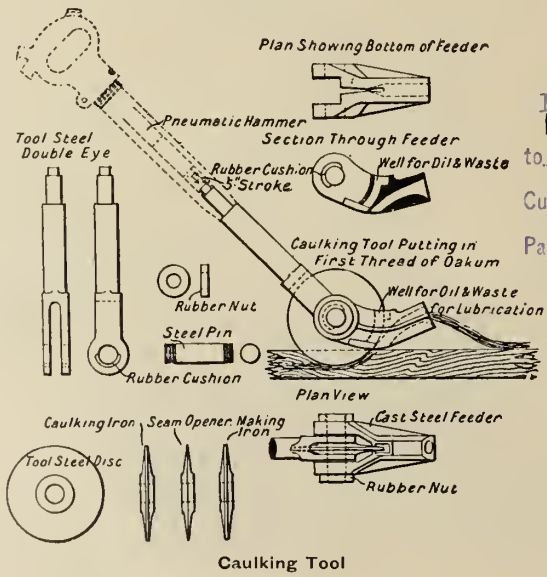
Average test on ten aluminum-bronze bolts:

Diameter—2 in.

Tensile strength per sq. in.—60,180 lbs.

Elongation, 8 in.—21 per cent.

Reduction in area—20 per cent.



Caulking Tool

Neither let mistakes or wrong directions discourage thee There is a precious instruction to be got by finding we were wrong It is at bottom the condition on which all men have to cultivate themsel es.

—Carlyle.

Alundum : The Latest Product of the Electric Furnace

NO more remarkable advance in mechanical lines has taken place in modern times than the development of grinding. The field of the old grindstone was limited, and the sharpening of edged tools was almost its only use.

The introduction of the emery-wheel, however, made grinding a very important operation. The emery-wheel has not only rapidly replaced the grindstone, but in many operations the work of the cold chisel, the lathe-tool, the file, and other steel-cutting toools is now done more efficiently by grinding.

Before the invention of the electric furnace, artificial abrasives suitable for grinding-wheels were unknown. Wheel manufacturers necessarily depended upon natural products,—chiefly corundum and emery. As emery occurs in considerable quantities in various parts of the world, it came to be recognized and used as the chief raw material for grinding-wheels and other products employed in grinding metals. On this account the modern grinding-wheel made of any abrasive is popularly known as the "emery-wheel."

The invention of alundum is the latest of the important electro-chemical inventions, which during the past few years, have attracted so much attention and made Niagara Falls the centre of electro-chemical industry in the United States.

The introduction of alundum in the field of grinding has been remarkably successful and rapid. The requisites sought for and attained in this abrasive are extreme hardness and sharpness, combined with uniformity and proper temper. So successful has been its development that alundum has become known as the standard of high quality and uniformity as an abrasive.

Process of Manufacture.

The process of making alundum consists in taking the purest amorphous oxide of aluminum found in nature, known as the mineral bauxite, purifying and melting it in the electrical furnace in a large, homogeneous bath or fluid mass. Upon cooling this molten fluid solidifies and crystalizes in solid masses of alundum of great purity and absolute uniformity throughout.

Bauxite, the raw material from which alundum is made, is the purest naturally-occurring amorphous oxide of aluminum known. This mineral was originally found at Baux, France, from which it derives its name, but purer forms are now obtainable in the United States. The best quality only is used in the manufacture of alundum and in its preparation practically all impurities are removed. The higher grades of bauxite used are of rare occurrence. The Norton Company, however, owns its own mines from which the purest grade is obtained.

The bauxite is heated in large preliminary heating furnaces to drive off the combined water, and is then melted directly in electric furnaces of special design. Beauxite was considered infusible until the invention of this process, no heat of combustion being able to melt it, the electric are only being equal to this task.

Eleven electric furnaces have been installed, each capable of producing three tons of alundum every twenty-four hours. Electric power necessary to melt these large charges into solid, uniform ingots of alundum is produced by the Falls of Niagara, and is furnished by the Niagara Falls Power Company.

The temperature at which the furnace charge melts into one homogeneous mass, is above the limit by which temperatures are measured by any means known to science, and is variously estimated between 6000 degrees and 7000 degrees Fahrenheit.

The operation of these furnaces and the composition of the molten bath is under the control of the furnace operator. Exact quality and uniformity which is so important in steel manufacture, is fully as important in the grades of steel are now being made in electric furnaces similar in design to alundum furnace, because impurities can be removed at the high temperatures obtained by the electric arc, and the quality of the molten bath uniformly maintained. In the alundum furnace both the purity and uniformity of the alundum is assured. Each step in the process is under the close supervision of expert chemists, who are constantly directing and following the work by careful analyses in our own chemical laboratory.

The large masses of molten bauxite are allowed to cool and crystallize in great ingots of purified crystalline alundum. Beautiful crystals are found in the centre of these masses, showing nearly all the variety of colors found in the ruby and sapphire, of which alundum is the commercial, artificial product. The rarer colors of light pink, blue and purple found in the rarer oriental gems are sometimes noticed in small crystals. The ingots of alundum are broken up into small pieces by means of powerful crushers. It is then passed through series of rolls to reduce it to the various sizes of grain, which are finally separated by passing over sieves of different mesh to prepare it for manufacture into Norton grinding wheels, rubbing and sharpening stones, and other articles.

The solid massive alundum. While resembling the purest natural corundum in chemical composition, has the remarkable quality of being considerably harder than the natural product. This is due to the perfectly fluid condition in which the mass is melted, the control of its composition, the rate and method of its cooling and crystallization by which it receives its temper, the absence of water of combination (which almost invariably exists in natural corundum), and the pure and even state in which the fluid mass crystallizes.

The process of manufacturing alundum is patented, being thoroughly protected by United States and foreign patents, both in process and apparatus. These patents are owned and controlled by the Norton Company exclusively.

Effective Qualities.

The necessary requisites for the most efficient abrasive for grinding wheels are :—

1st.—Sharpness.
2nd.—Hardness.
3rd.—Right Temper.
4th.—Uniformity.
5th.—Abundant supply.

To have sharpness in order to obtain the most satisfactory results,—so far as rapid and continued cutting is concerned,—a peculiar quality is necessary There must be a fracture which will give a number of sharp-cutting points. This is obtained in alundum to better advantage than in any other abrasive material.

In the matter of hardness the recognized standard is the diamond, which is No. 10 in the scale of hardness; nothing that man has yet discovered or made equals the diamond in hardness. The term "hardness" is, therefore, a comparative term, the hardness of a mineral being ascertained by its ability to scratch another mineral of a known degree of hardness, or to be scratched by such a mineral.

Pure crystaline corundum, represented by the best sapphire or ruby, has always been the standard for No. 9 in the scale of hardness. This is readily scratched by alundum ; in fact, alundum powder is used for cutting and drilling rubics and sapphires for watch jewels, etc.

After numerous careful tests, comparing alundum grains with other abraisive grains, including the diamond, alundum is found to exceed 9 1-2 in the scale of hardness where the diamond is 10.

By "temper," is meant its strength of grain and the character of its fracture under grinding pressure. An alundum grain is remarkably tough, and will stand more crushing pressure before breaking than any other abrasive grain, but when it does break, it breaks with a sharp, crisp fracture, giving a fresh keen-cutting edge. This is a most important quality in an abrasive.

The purity and uniformity of alundum far surpasses that of any other abrasive. Purity, besides resulting in greater hardness and better temper, is necessary in the bonding of the grain into wheels in order to secure accurate and uniform results, and uniformity is necessary to secure constant efficiency and accuracy of grade and temper in a wheel, so that wheels can be accurately duplicated at any time and maintain their standard of work.

Uniformity is one of the most important requisites in an abrasive. The ability to duplicate a grinding wheel is essential to efficient results from its use. In grinding wheels the abrasive grain of given size is bonded together to produce a certain grade or temper for a certain kind of work. This means that the bond which holds the grains together must be harder or softer, according to the particular work required of the wheel. Different grades are required for different materials to be ground; cast iron, steel, brass, glass, bone, leather, wood and other substances demand wheels of special grade which must be duplicated to make the grinding operation continuously efficient.

It is for this most important reason that great stress is placed on evenness in quality of the abrasive itself. Grades cannot be duplicated accurately without having a known and dependable factor in the uniformity of the material composing the wheel; and this important requisite is to the highest degree found in alundum.

Alundum and the process of making it, were awarded the Grand Prize, at the St. Louis, Exposition. The individuals responsible for its invention and development were honored with diplomas and medals for their part in this most notable, practical invention.

Companies Incorporated

The Commercial Cement Company, Winnipeg, were incorporated with a capital stock of $150,000.

The Leitch Collieries, Limited, capital $1,000,000.00, propose to develop mining properties and operate same. Head office, Ottawa, Ont.

The Rogers Mfg. Co., Limited, propose to manufacture lubricating devices for journal boxes, capital $200,000.00. Directors: A. F. Ritz, A. E. Dancey and A. J. Stanford. Head office, Toronto.

A. R. Rogers Lumber Co., Limited, capital $500,000.00, propose to carry on the business of lumbering and a general mercantile manufacturing and contracting business. Head office, Winnipeg, Man.

St. Joseph Transportation Co., propose to construct a canal so as to create a navigable waterway somewhere on the eastern shore of Lake Erie, in the county of Elgin and to maintain same.

A firm has been incorporated under the name of Western Fire Clay Products, Limited, Winnipeg, with a capital stock of $600,000 for the purpose of manufacturing brick, tile, pipes, and all articles manufactured from clay.

The British Canadian Engineering Co., Limited, capital $250,000.00, propose to carry on the business of mechanical and electrical engineers and iron founders. Directors: J. I. Sutcliffe E. S. Sutcliffe and R. Williamson. Head office, Toronto.

The Marvel Acetylene Generator Co., Limited, share capital $10,000, propose to instal acetylene plants and deal in gas fittings. Directors are: A. J. Moore, F. W. Moore, A. E. Scanlon, C. W. Ellis and Chas. Wilson. Head office, Bradford, Ont.

The Nipissing Power Co., Limited, capital $100,000.00, propose to generate power to supply to the several municipalities in the vicinity of Lake Nipissing. Provisional directors are: Alice Scott, E. R. Lynch and J. P. Crawford. Head office, Toronto, Ont.

Automobile and Sportsmen Exhibition, Limited, share capital $20,000.00, propose to conduct exhibitions of automobiles, motor boats, motor engines, etc. Directors: Robert Jaffray, Stanley Jackson and Robt. McKay. Head office, Montreal.

A charter has been granted The Volcanic Oil & Gas Co. of Chatham, who propose to produce and make petroleum and natural gas. The share capital is $300.000. The provisional directors are D. A. Cash, Port Colborne; H. D. Symmes, Niagara Falls and J. T. O'Keefe, Chatham.

Gravel and Duhamel, Montreal, have been incorporated with a total capital stock of $99,000, with P. Gravel, J. G. Duhamel, J. A. Barrette, V. Laperte, all of Montreal, for the purpose of manufacturing iron goods, hardware, carriager, furniture, saddlery, as well as to develop hydraulic and steam power.

A company has been incorporated at Ottawa, as the Crude Oil, Gas and Power Company, with a share capital of $100,000, for the purpose of producing and dealing in gas of all kinds, motive power, heat and light. The head office will be at Windsor, and the directors are W. H. Leith and H. J. Booth of Detroit, and C. L. Meyer, Windsor.

The Canadian Refining Company, Ottawa, has been organized with Dominion charter to refine and smelt minerals. The capital stock is placed at $2,000,000 and the provisional directors are:—H. Ray, Ottawa; F. W. Rolt, Rossland, B.C; J. Jean Baptisti, Notre-Dame-de-Standridge, Quebec; E. Hoffman, New York; R. Dieffenbach, New Jersey; J. J. Fleulot, Frank, Alberta.

The Ontario Nickel Company has been incorporated with a capital of $1,000,000, with head office at Worthington, Ont., for the purpose of mining, milling, and developing mines. The Canadians among the applicants for incorporation were, W. S. Tates of Worthington, Ont.; H. H. Dow, W. L. Baker, Midland, Mich.; A. E. Corners, and T. E. Collings, Cleveland, Ohio.

The Leach Concrete Company has been incorporated with a share capital of $10,000, with head office in Toronto, for the purpose of carrying on a business as concrete contractors and builders, and to manufacture plain and reenforced concrete, for structural and engineering works, and fire proof buildings. The directors of the company are R. Leach, W. Leach, R. W. Eyre, E. E. Wallace and H. M. Sinclair, all of Toronto.

Why, Indeed.

Like true British workmen, they were not, for the moment, doing anything particular. Some were smoking pipes and lounging about with their hands in their pockets, on a site chosen for the erection of some new houses.

"I can't allow this idling," said the builder, coming up full of importance and ideas. "Come along ; set to work!"

"Can't go on, sir," replied a bricklayer, looking at his trowel with tender solicitude and affection ; "we ain't got no plans yet!"

"Plans?" echoed the builder, with scorn ; never mind about plans. Put a kitchen here," he explained with a wave of his hand, "and a parlor there," pointing near to the imaginary kitchen ; "they're bringing in the furniture next week. What's the good of wasting time. Get a move on you, men!"

The Ready Remedy.

When trouble after you doth chase,
Why, turn and stare her in the face
And smile.
And she will hurry from your sight ;
A smile will fill her full of fright,
So smile.
When worry hustles after you
And dyes the world a sombre hue,
Just smile ;
A grin will drive her far away.
So let your laughter muscles play
And smile.

Industrial Progress

CANADIAN MACHINERY AND MANUFACTURING NEWS would be pleased to receive from any authoritative source industrial news of any sort, the formation or incorporation of companies, establishment or enlargement of mills, factories or foundries, railway or mining news, etc. All such correspondence will be treated as confidential when desired

At Sydney, N.S., a technical school has been opened.

A new leather goods factory has been started at Brampton.

Turpentine works will shortly be established at Killaloe, Ont.

A Chatham firm will erect a large stair mill, at Rainy River.

A new woollen mill to cost $25,000 is to be erected at Lethbridge.

A breakwater, is to be built at Port Arthur, at the cost of $350,000.

A new factory to manufacture clothing has been opened at Oakville.

Vancouver will spend $150,000 on new school buildings and sites next year.

The Dowswell Mfg. Co. is erecting an $8,000 addition to its plant in Hamilton.

The Scott Lumber Company, are building a lath mill at Fredericton, N.B.

The Polson's Iron Works, Toronto, are to build a steel workshop to cost $25,000.

The Sharples Separator Company, Toronto, have erected a $15,000 brick factory.

Fort Frances is to have a new street water tower with a capacity of 100,000 gallons.

Goderich may install a producer gas Engine in connection with their electric light plant.

The J. H. Ashdown Hardware Co., of Winnipeg, will erect a branch warehouse in Calgary.

C.P.R. machinists on the eastern lines, have been granted a ten per cent increase in wages.

The York and Sunbun Milling Co. of Gibson N,B., will erect another large saw mill at that place.

Asbestos is said to have been discovered in South Africa, equal to the finest Canadian product.

The name of the Toronto Contracting & Paving Co. has been changed to the Orpen Co., Limited.

The Northwest Threshing Machine Co. of Stillwater, Minn., will build a large warehouse in Brandon.

Work on the Toronto Type Foundry's new plant at Toronto Junction, is rapidly nearing completion.

A one storey brick factory is to be erected for the Toronto Plate Glass Company, to cost $16,000.

The enormous amount of business done this summer is in evidence on every hand, and the railways and lake shipping report a banner year.

A contract has been let for the erection of a new building at Walkerville for the Dominion Dash Co.

A Birmingham small arms company are sending a representative to Canada to establish agencies here.

The National Spring and Wire Co., will locate in St. Catharines, where they have leased a factory.

The Massey-Harris Co. has taken out a permit for a $15,000 extension to their main building in Brantford.

The Dunlop Rubber Company, Toronto, are erecting a two-storey brick rubber factory, to cost $18,500.

The buildings of the Rapid Tool Co., at Peterboro, have been completed, and machinery is now being installed.

Mr. F. W. Bauer, Montreal, has been appointed secretary-treasurer of the General Supply Co., of Ottawa.

The Chapman Double Roller Ball Bearing Co. is erecting a $10,000 factory on Sorauren avenue, Toronto.

The American Metal Co., of Winnipeg, has sold out, and the Detachable Boiler Flue Mfg. Co. has been incorporated.

An Indiana firm is to erect a fifty thousand dollar plant at Guelph, for the manufacture of brick-making machines.

The Meisel Manufacturing Co. will build a plant at Port Arthur for the manufacturing of harvesting machinery.

The Gibson Manufacturing Co., Port Washington, Wis., has been granted a fixed assessment of $5,000 to locate in Guelph.

The International Portland Cement Company, Hull, Que., made a record shipment of 300 barrels in one day recently.

The contract has been issued for the building of the new Terminal Station at Hamilton. The cost will be about $230,000.

A permit has been issued the Canada Cycle and Motor Company, for a $4,000 addition to their factory at Toronto Junction.

The Walter's Lumber Co. of Strathcona, has taken out a permit for the erection of a $15,000 saw mill at Edmonton.

A hydraulic plant has been installed two miles out of New Liskeard, to supply that enterprising town with light and power.

Tolden, B.C., is to have one of the largest saw mills in the country with a cutting capacity of 50,000,000 feet in a season.

Sherwin Cooper & Company, manufacturers of gasoline engines, have secured a factory site on the Don Flats in Toronto. They will employ 50 to 75 men.

The Sydney Cement Company have closed down on account of not getting the regular supply of slag from the Steel Company.

Jones Bros., manufacturers of barber-shop and bar fixtures, Toronto, have purchased the plant of the Dundas Refrigerator Co.

The Ross Rifle Co., Quebec, are looking for a location in Ontario for the removal of their plant for manufacturing sporting rifles.

Mr. W. C. Rankin, of the Carborundum Co., Niagara Falls, N.Y., was a recent visitor at the Montreal office of "Canadian Machinery."

The Canadian Art Iron Works Company, Welland, Ont., will erect three buildings to cost $15,000, and will employ fifty men.

The cement mill at Longue Point, Que., is being enlarged, and when finished will have an output of about 4,000 barrels per day.

It is expected that a big rolling mill will locate at Sydney, N.S., to manufacture articles used in building and railway construction.

Representatives of the Dominion Steel Co., of Sydney, C.B., have been in Port Arthur with a proposal to establish a wire works there.

The Union Bank has bought the lot at the corner of May and Victoria streets, Fort William, for the erection of a branch in that town.

The Sutherland-Innes Co., Chatham, are to establish a stave plant, not a stove foundry, at Rainy River, Ont., as reported a week ago.

The Canadian Port Huron Company, with offices at Winnipeg, will build a new warehouse in Calgary, to be used as a central distributing point.

The ratepayers of Alvinston, Ont., will vote on a by-law to loan $6,000 to J. Smith for the establishment of a basket and nail-keg factory in that town.

The Dominion Bearings Company, have purchased a block in St. Catharines, and are installing machinery for the manufacture of Wright roller bearings.

Contracts for improvements to the power plant of the Lake Superior Corporation at the Michigan Soo, amounting to about $1,000,000, are being let.

Gaar, Scott & Co., Richmond, Ind., large manufacturers of thrashing machinery, will locate a factory in Western Canada, probably at Winnipeg.

A company has been formed at Petrolia, Ont., for the purpose of handling ex-

plosives for drill purposes, and to bore for oil, gas and other minerals of all kinds.

The Canadian Clothespin and Woodenware Manufacturing Co., will erect a new factory in Renfrew, Ont., where they will begin operations early in January.

Harvey Graham, Assistant General Manager of the Nova Scotia Steel & Coal Company, is undergoing medical treatment at the General Hospital in Montreal.

The Brantford Folding Paper Box Company has been sold to C. R. Somerville of London, who will continue the business in Brantford for the present.

The C.P.R. has placed an order for half a million Bartley nut locks with the J. A. Young Co., Montreal. This number will be sufficient to equip 250 miles of track.

The Tilson Manufacturing Co., of Port Washington, Wisconsin, have decided to locate their Canadian branch in Guelph, where they will manufacture gasoline engines.

The Grand Trunk Repair Shops will locate at New Toronto, where they will manufacture all steel switches and diamond crosings used on the whole G.T.R. system.

Work on the mountain drain improvements at Hamilton is being rushed, but there is little prospect of completing it this year. Scarcity of labor is one of the main drawbacks.

The Rhodes, Curry Co., car builders of Amherst, N.S., claim they were never so busy at at the prescnt time, and the shops have to work night and day to keep up the stock.

Messrs. Heney & Miller, builders and contractors, Toronto, will open a branch office in Woodstock for the sale of builders supplies and machinery, stone, cement, sewer and field tile.

The North Ontario Reduction & Refining Co. have commenced work on their new plant at Sturgeon Falls, which will be in operation next Summer with a capacity of 100 tons per day.

At Sydney, N.S., the council have decided to give a bonus of $50,000 to a firm manufacturing railway supplies and Mowry bolts. The plant will cost $400,000 and work will be given to 250 men.

The Nelson, B.C., Iron Foundry has made two good three-year contracts with British Columbia Smelter companies, and business is so good that a branch shop will be opened at Greenwood, B.C.

Building has been started on the plant of the Lehigh Portland Cement works near Belleville. It is claimed by this time next year they will be turning out cement at the rate of 50,000 barrels a day.

Building permits to the amount of half a million dollars, were issued in Stratford this year. The by-law to guarantee the bonds of the Kemp Manufacturing Company, was carried and the above company take over the old Kemp factory, heretofore occupied by the Massey-Harris Company, and will manufacture agricultural implements.

Guelph is to have a new factory. The Standard Knitting Company has been secured. The Anton Berg & Son Company have asked for a loan of $25,000 which will be decided upon by a vote of the citizens.

The mica works which have been operated in Smith's Falls for the past three or four years, are being removed to Ottawa. The reason given for leaving is that they cannot get enough female laborers.

Kelly Bros. & Mitchell, of Winnipeg, have been awarded the contract for the erection of the new building in Vancouver for the Canadian Bank of Commerce. The cost will be in the neighhood of $400,000.

The Dominion Iron & Steel Co., of Sydney, N.S., state that they can manufacture cement from slag much cheaper than it can be manufactured of marl in Ontario. They are going after the Northwest market.

The Prince Albert, Sask., Board of Trade, may ask Ames Holden Co., shoe manufacturers Montreal, to establish a branch there. It is also suggested that a by-law be passed granting the C.N.R., a bonus of $25.000.

The John Morrow Machine Screw Company, Ingersoll, have purchased the plant of the Standard Bolt & Screw Company, Toronto, valued at $28,000 and will be taken to Ingersoll to supplement the plant there.

The Silvia Brick & Lime Co. Victoria B.C., have opened a $30.000 plant, capable of turning out 20,000 brick per day, and $10.000 will be expended in machinery for refining raw lime, with a daily capacity of 200 barrels.

The Canadian Westinghouse Company have been awarded a contract for apparatus to be used in the new power station on the Voulager Canal on the St. Lawrence River, to supply Montreal with heat, light and power.

A coal famine is reported in the West, owing to the shortage of cars. Winter has set in, but it will likely be some time before the supply is to hand. The coal mines at Medicine Hat have been reopened as a result of the scarcity.

Westport, N.S. ratepayers will vote on a by-law granting a bonus of $4,000 to the New Idea Buckle Co., to establish a factory in that village for the manufacture of saddle and harness, hardware and other malleable work.

Copper has been found in Hastings County near Belleville in paying quantities. 150,000 pounds of pure copper has been extracted so far. The Medina Copper Company will take over the property and work will be rushed along.

A contract has been given by the Chicago and St. Lawrence Steam Navigation Co. to the Canadian Shipbuilding Co. for a steel freight steamer to be 510 feet long over all, 500 feet on the keel, 56 feet beam, and 31 feet deep.

The concrete foundation for the new steel water tower which the Town of Fort Frances, Ont., is erecting in connection with its waterworks system, has been commenced. The tower will be 92 feet high, with a capacity of 100,000 gallons.

The Sussex Mfg. Co. have amalgamated with the Taylor & McKenzie Co., of Guelph, Ont., who will move their machinery to Sussex, where they will manufacture furniture, refrigerators, etc., and will be known as the Sussex Manufacturing Co.

The Canadian Pacific Railway Co. are to construct a new building on Osborne street, Montreal, at a cost of $38,000. The building will be used as an express office, and will be 176 feet long by 87 feet deep, two storeys high and concrete throughout.

Work on the 30 new dwellings for the employes of the Ontario Iron & Steel Co., at Welland, is being rushed by the Welland Construction Co., who have the cantract. Fifteen of the houses are to be finished by Jan. 1, and the remainder by the 1st of March.

The White Company has been awarded the contract for building the terminal station for the Cataract Power Company at Hamilton. The building will cost $200,000 or $250,000, and will be the terminus of the electric lines concontrolled by the company.

The Atikokan Iron Company, at Port Arthur are busy on the construction work of their new plant, which will cover an area of forty acres, containing 100 coke ovens which will make 200 tons of coke per day, and a furnace producing 100 tons of iron per day.

Goderich ratepayers have carried two important by-laws. One to loan $50,000 to the Goderich Wheel Rigs Co. to assist in erecting a $100,000 factory for the manufacture of baby carriages, etc. And the other to assist the Jackson Clothing Co. by supplying electric motive power.

The Harbison-Walker Refractories Co., Pittsburg, Pa., has taken over the selling organization of the Portsmouth Harbison-Walker Co., and in the future all brands of brick, etc., made by the Portsmouth Harbison-Walker Co. will be sold by the Harbison-Walker Refractories Co. direct from its Pittsburgh offices.

The Lake Superior Corporation, Sault Ste. Marie, Ont., will build an addition of 500 feet to its ore dock as the steel plant dock, which is now 900 feet in length. An additional blast furnace is also being considered by the directors, the furnaces now in operation being unable to supply enough pig iron for the plant.

The Electric Development Company, started a unit of their power plant at Niagara Falls on Nov. 3. When the headgate was opened and the water filled the long penstock the twelve thousand horsepower turbine wheel began to spin as smoothly as a top, and the biggest vertical electric generator ever started in the world was put in motion.

Preliminary work on what is expected to be one of the biggest coal docks in the district of the lakes was started at Detour, near the Soo, yesterday. The dock is to be 1,000 feet long, 300 feet wide, and the estimated cost, with machinery complete, is $400,000. Several boats at a time will be able to coal there. Construction will be started in the Spring.

Building permits amounting to $250,000 were issued in Toronto from November 10, to November 17, inclusive. The permits include 55 houses, a warehouse for oil storage, by the Canadian Oil Company, to cost $5,000, a workshop for corrugated iron at the foot of Peter Street, to cost $2,000, and a charging station for the Commercial Acetylene Company, to cost $2,000.

The Hawkeye Co., manufacturers of trip hammers, Cedar Rapids, Iowa, are about to start manufacturing in Canada. Their goods have been on the market in the United States during the past five years, and are already known in the Canadian market. Mr. F. F. Davidson, of the Hawkeye Co., was in Toronto recently with a view to making the necessary arrangements for manufacturing the trip hammers.

The Canadian Copper Co., of Copper Cliff, has bought from Allis-Chalmers-Bullock, Montreal, a pumping plant consisting of an eight-inch single stage turbine pump driven by a 70 h.p. induction motor. The Calumet Mining and Milling Co., Calumet, Que., has increased its plant by a 12¼ by 18 inch "Ingersoll" air compressor driven by a 50 h.p. induction motor, both bought from Allis-Chalmers-Bullock, Montreal.

The Dominion Iron and Steel Company, Sydney, N.S., has contracted with the Nova Scotia Coal and Steel Company for the output of their coke ovens until the first of January, by which time their own blast furnaces will have started. This, in addition to the output of the Steel Company's own ovens, will enable them to start the second blast furnace, probably by the end of the week.

The Shipway Iron Bell and Wire Manufacturing Co., Toronto, are asking the Council at Niagara Falls for a free site, electric energy up to 100 horse-power at $10 a year per horse-power, low rates for water, gas, and fixed taxation for ten years. In consideration of this would move to Niagara Falls, extend their factory and employ 50 to 100 men. The proposed stock of the company is $150,000.

An effort is being made to bridge over the difficulties between the Dominion Coal Company and the Dominion Iron & Steel Company. The former company is closing down four of its collieries, owing to the steel plant's idleness and the approach of the close of navigation of the St. Lawrence route. The Bank of Commerce is heavily interested in the Steel Company and Senator Cox is on the directorate of both companies. Sir William Van Horne has retired as a director of the Coal Company owing to his large interests in the Steel Company.

The new factory of the McGlashan, Clarke Co., at Niagara Falls, Canada, is now in operation. The site of the factory is on the direct line of the Michigan Central Railway, and the main building is 70 x 300 feet. It is equipped with the latest machinery. Electric power is used throughout. Flat ware and cutlery, both in silver and nickel-silver, are being manufactured. The officers of the company are: E. G. Clarke, president; J. G. Cadham, vice-president; Lee McGlashan, general manager, and S. Woods, secretary and treasurer. John C. McCain is superintendent.

An important development in the industrial world recently, has been the purchase by the Canadian Consolidated Rubber Co., Montreal, of the Maple Leaf Rubber Co., who operate a large plant at Port Dalhousie, Ont. The paid up capital of the Maple Leaf Co. was $350,000. The purchase was a cash transaction. Although the output of the Maple Leaf factory is confined to rubber footwear, several hundred hands are employed, and a large business is being done in these lines. The Montreal concern has already assumed control of the Maple Leaf factory, and its capacity will be considerably increased in the near future.

The Billings & Spencer Co., of Hartford, Conn., have definitely decided to extend their operations to Canada, and have formed a Canadian company for this purpose, to be known as the "Canadian Billings & Spencer," with a capital of $200,000, Mr. Billings, of Hartford, being its president. The Billings & Spencer Co. are the largest and oldest established company making drop forgings in the United States, and are also manufacturers of all kinds of drop forging machinery. They have secured as general manager of the Canadian company, J. Gill Gardner, at present manager of the steel and forge department of the James Smart Mfg. Co., of Brockville, Ont. The location of the plant has not yet been finally decided.

In referring to New Zealand's new tariff J. S. Larke, Canadian commercial agent in Australia, reports that in the case of bicycles, wagons, perambulators, fancy goods and toys, hardware, lamps, pianos, plateware and pumps, the United States will have to pay 30 per cent., while Canada and Britain will pay 20 per cent. On footwear the United States will have to pay 33 3-4 per cent. and Canada 22 1-2 per cent. In hops the United States will pay 9d, Canada 6d; nails, United States, 3s, Canada, 2s per cent.; furniture, United States 37 1-2 per cent., Canada 25 per cent.; wall paper, United States 22 1-2 per cent., Canada 15 per cent.; wrapping paper, United States 7s 6d, Canada 5s per cent., bicycle parts, gas and oil engines, gum boots, printing paper, rails, sailcloth, canvas, surgical and dental instruments, United States 20 per cent., from Canada and Britain free.

The Dominion Iron & Steel Co., Sydney, N.S., were forced, Nov. 3, to stop their blast furnaces for the lack of coke. The trouble appears to be over the supply of coal for the manufacture of coke. The steel company contend that they were being supplied by the coal company with an inferior quality. This became so pressing that they began the importation a few months ago of a supply from the Nova Scotia Steel & Coal Company at Sydney Mines. They brought over 30,000 tons, and have ordered more. This coal cost them considerably more at the plant than the Glace Bay product, and the company, it is understood, charged the Dominion Coal Co. with the difference in cost. President Ross refused to pay this, and went further by practically shutting down their supply. Such is the common version of the cause of the difficulty.

The Dominion Iron & Steel Co. made a great record during October. The quantity of steel ingots turned out in the thirty-one days exceeds by 2,825 tons the best previous output for any corresponding period. The output of the various departments was: Coke, 34,400 tons; pig iron, 23,325 tons; ingots, 25,425 tons; blooms, 22,553 tons; rails, 12,621 tons; rods, 5,214 tons. During the month three blast furnaces were operated. The blooming mill and rail mill worked double shift, while the billet mill and rod mill were on single shift. Of the various materials finished for market 16,500 tons were shipped, and, in addition, about 5,000 tons of rails were stocked. These will be loaded on the steamship "Bergenhus" now in port. Over 125,000 tons of ore and limestone were brought in, and the tonnage of materials handled in and out amounted to over 200,000 tons.

The United States Steel Corporation has perfected plans to dominate the Portland cement industry of the United States. This step is in keeping with the modern tendency of big corporations to utilize every ounce of by-products. The steel corporation will make use of its slag, which has heretofore been of practically no value, and by this means it is hoped to add materially to revenue. The demand for cement is growing at a rapid rate, and the industry is regarded as a peculiarly profitable one for the steel trust, with its unrivalled facilities, to engage in. Official announcement is made of the plans by which the steel corporation not only will control the Portland cement industry in Chicago, but will invade the east by building a plant near Pittsburg. The Universal Portland Cement Company, capitalized at $1,000,000, took over on October 1 the plants and business of the cement department of the Illinois Steel Company. It is planned to increase the output of cement by nearly 150 per cent. by the erection of a new plant near Pittsburg. To do this $3,000,000 will be expended—taken from an appropriation made by the management of the steel corporation last Spring. When the plants are completed the yearly putput will be about 6,000,000 barrels and will exceed by 10 per cent. that of the entire country. This will give the corporation the premier position in the industry, and it is probable that other plants will be started to keep pace with what is expected to be a rapidly growing demand.

Activity at Collingwood.

The Northern Steel & Iron Co.'s mills at Collingwood are working successfully after over a month's operations and 125 men are kept busy in the day and night turns making bar, car and track

iron on orders for the Canadian General Electric, Canadian Car, Toronto Railway and Grand Trunk Railway Companies. The output will be doubled by the addition of two new furnaces which will be ready about December 1.

The Imperial Steel and Wire Co.'s plant is also in successful operation, the output having been increased 15 per cent. recently with the same equipment. "The shortage in wire billets and in railway cars is both helping to make the wire nail market firmer and with base prices at $2.10 in both New York and Chicago and $1.95 in Pittsburg, it looks as though we will see $2.25 asked for wire nails before many weeks," said Major Currie, president of the Company this week.

Large Mineral Production.

Returns made to the Bureau of Mines give the output of the metalliferous mines and works of Ontario for the nine months ending 30th September, 1906, as follows:—

	Quantity.	Value.
Gold, ounces	2,015	$ 34,377
Silver, ounces	2,542,827	1,609,554
Cobalt, tons	138	110,400
Nickel, tons	8,037	2,856,233
Copper, tons	3,900	600,000
Iron ore, tons	93,159	117,466
Pig iron, tons	208,094	3,194,200
Steel, tons	123,257	3,059,070
Zinc, tons	300	4,500
Arsenic, tons	691	13,830

These figures show a considerable advance over those for the same period of 1905, and indicate that the production for 1906 will be much the largest of any year in the history of metalliferous mining in Ontario. The silver, cobalt and arsenic given in the above table are all the product of the Cobalt silver field. The nickel entirely and nearly all the copper are from the Sudbury district, and the iron ore is the product of the Helen mines at Michipicoten.

New Machinery at Belleville.

The Belleville Rolling Mills, which started operations recently, is running to its full capacity during the day hours, but will not run at night for the present. The plant comprises three rolling mills, 18, 12 and 9 inch, and a fully equipped machine shop. An up-to-date horseshoeing department is under construction, and a large cement cistern has been built near the proposed dock. Much new machinery has been installed during the past summer. One machine the "Squeezer," makes it possible for the mills to economize greatly in the matter of labor. Big piles of scrap go into the furnaces, come out in a molten condition, and then go into the "squeezer," from which they come in the shape of a big red-hot ball. This ball goes to the "rollers" at the 18-inch mill, and is gradually worked along till it becomes bar iron. The "squeezer" weighs 80,000 pounds. The new shears purchased in Pittsburg weigh 100,000 pounds, and will shear iron six inches thick. The lack of such shears as these militated greatly against the successful operation of the mills in old times.

Want Electric Power.

With the first delivery of electric energy from Niagara to Toronto, the question of power for the various municipalities has received considerable impetus. From all over the province requests have been coming in from various municipalities to the Hydro-electric Commission for power, showing the popularity of this movement, forty-six in all have asked for electrical energy, totalling 125,000 h.p. in lots varying from a few hundred horse power to 30,000. Hon. Mr. Beck states that these will all be supplied in accordance with their requests. The amounts required by some of the municipalities are as follows:

	H.-P.
Toronto	30,000
Toronto Junction	10,000
London	10,000
Berlin	3,000
Galt	2,500
Woodstock	1,200
Guelph	3,000
Preston	800
Waterloo	900
Stratford	5,000
St. Mary's	2,000
Paris	1,000
Hespeler	750
Brantford	3,000
Orangeville	1,000
Parkhill	500
Leamington	250
Brampton	1,200
St. Thomas	1,500
Lucan	300
Cottam	500
Tilsonburg	1,000
Milton	500
Ingersoll	1,350
Acton	800
Norwich	200
Windsor	5,000
South Dumfries	3,000
Simcoe	500
Elmira	600
Dundas	3,000
Strathroy	225
Richmond Hill	100
Walkerton	1,500
Harriston	400
Durham	2,000
Hamilton	15,000
Total	113,575

The applicants in other districts are:

	H.-P.
Belleville	3,200
Chatsworth	50
Thedford	50
Bayfield	150
Ottawa	3,000
Brockville	1,000
Steelton	1,000
Port Arthur	2,000
Stanley	50
Total	10,500

Welland's New Steel Plant.

The Ontario Iron & Steel Company has, under course of erection at Welland, Ontario, a plant for the manufacture of open hearth steel billets, bars, angles and light rails, and for the production of steel castings in size varying from one pound to ten tons. Their site covers sixty acres of ground with a frontage on the Welland Canal and track connections with the Grand Trunk, Wabash, Michigan Central, Canadian Pacific and T. H. & B. Railways. A dock is to be constructed on the canal front, which will enable the company to economically handle their raw material by water. The Canadian Government has at present under construction a turning basin in the canal just below the property of this company, which will enable large steamers, coming in from Lake Erie, to discharge their cargoes and return again to the lake without entering the canal locks—the company's dock being located on the Lake Erie level.

J. A. Herrick, M.E., of New York, has the furnace construction in hand, and W. J. Bradley, M.E., of Troy, has in charge the rolling mill construction. Robert Porter, late of the riverside department of the National Tube Company, is to be works manager, while the foundry plant will be in charge of Daniel J. Blaney. The head office will be in the Traders' Bank building, Toronto, the President of the company being W. W. Near, of the Page Hersey Company, Guelph, and the Secretary, H. Rooke.

The buildings are to be the following dimensions: Open hearth building, 85 x 175 feet; rolling mill building, 119 x 300 feet; foundry building, 150 x 165 feet. The buildings are to be equipped with travelling cranes built by the Niles-Bement-Pond Company, and operated with alternating current motors. Power to run the works is to be furnished by the Ontario Power Company, Niagara Falls, Ontario.

The company controls its own natural gas wells, which will be used for furnishing fuel for the furnaces. The rolling mills will consist of 3 high 12 and 22 inch trains, to be driven by alternating current, 2,200 volt motors. The open hearth department will consist of two 25 ton open hearth furnaces, and the foundry department of one 20 ton open hearth furnace. The 22-inch train will be served by a continuous ingot furnace and the 12-inch mill of two heating furnaces. The object being to make the operation of the mills as nearly continuous as possible.

The company expects to be making steel early in spring, and to have the plant in full operation by the 1st of July, next, but the difficulty experienced by buyers in getting iron and steel may make this impossible.

New Stove Foundries.

The Sutherland Innes Company of Chatham, Ont., have purchased a site and will locate a stove foundry at Rainy River, Ont. They will employ 35 hands and stock and plant will cost $15,000.

The new buildings for the Supreme Heating Company's stove foundry have been commenced at Welland.

HOARDING OLD METALS.

Most of those who have had a long experience of the trade in old metals are aware that a miserly habit of hoarding often takes possession of the men who collect copper, gun metal, brass, and even old iron. In many cases it is not so much the hope of making an extra profit which induces them to hoard as the recoil from the well defined feeling of pain they experience in parting with their stock—a feeling similar in character to that of the miser who keeps his gold and starves himself to death. This feeling undoubtedly militates against the free selling of old metal, and in times of moderate prices large quantities are kept back from the market for this reason only. There must be a point in the price-movement of copper, however, when a large proportion of these old-metal hoarders can be tempted to part with their accumulations, and this point may lie between £90 and £100 per ton for standard copper. As the market approaches this level the hidden stores of old copper, gun metal, and brass should begin to return into composition. Those who remember the Secretan copper boom will recollect that an extraordinary quantity of old metal was poured into the market when copper passed the limit of £100; and taking into consideration the fact that what may be called the "latent copper supply" of the world is now five or six times as great as it was in 1887-9, there is at least the possibility of an enormous outpouring of old metal should the market price of standard be carried very much higher than it is at present. But even if such an outpouring should take place, the fact that the consumption of copper is now much greater than it was in the early eighties should prevent serious market troubles as a result of the release of large quantities of old metal. Still the possibility of their release is worth bearing in mind both by dealers in old and by consumers of new metal. —Ironmonger.

A New City..

Streets are being laid out in Prince Rupert, the Grand Trunk Pacific terminal on the northern coast of B. C. The first street which is 100 feet wide has been cleared and is being planked, in lieu of paving which will come later. Within three months the embryo city is to be lighted by electricity, is the assertion of Thos. Dunn the pioneer hardware merchant of Vancouver, who has already concluded arrangements which make him the pioneer of the new terminal city. Mr. Dunn has just returned from a visit to the new city, prior to making final arrangements to take his stock there and establish the first hardware emporium.

Some 300 acres of the new town site are now being laid out and a force of seventy men under engineer Pillsbury are busy with laying out the first sections. Other survey parties are busy making final locations for the railway line on Kaien Island, as the land is locally known, where Prince Rupert is to stand. The lines are being finally laid out, and grading will follow. At the same time Dominion Hydrographic Engineer Dodge is located at Prince Rupert for the winter, engaged on surveys of the harbor of Prince Rupert and contiguous waters. The lumber for construction of the first house which the railway company will erect has been sent forward by steamer to Prince Rupert. It is not the present intention to place lots on the market, but leases of lots for business and other purposes will be made, and the railway company will also build a number of houses and other buildings which will be rented to the first locators in the new city.

Power in Vancouver.

Completing the fourth unit of installation, the Vancouver Power Co. has just installed a Pelton water wheel which brings up the total of power generated at the big power plant on Burrard Inlet, North Arm, to 12,000 h.p. That is, for the operation of the B. C. Electric Railway's lines in this city, and the city of New Westminster, besides for the interurban line, and for power and light in both cities and adjacent suburban districts, there is now 12,000 h.p. available. It is considered that this total will not greatly exceed the demand this winter. The Company has space and power, undeveloped, to instal in all ten units, to generate a total of 30,000 h.p. The plant is located at Lake Beautiful, some fifteen miles from Vancouver on the North Arm of Burrard Inlet, where the water is conducted by great pressure pipes down to the wheels, whence it flies direct into the sea.

Mining in B.C.

The smelters and mines of the interior of the Province are in a bad way through the big strike of coal miners at Fernie, whence a large percentage of the coke for the various smelting plants comes. The Eugene mine is shipping high grade contrates to Illinois and storing low grades at the Trail smelter, which is shut down at present. The Granby smelter at Grand Forks is still running, and so is the Hall Mines smelter at Nelson, the West Canadian Collieries, with coke ovens at Lille, near Frank, having arranged to supply sufficient to ensure the smelter operating.

The Granby smelter at Grand Forks is endeavoring to increase its output again by returning to its full capacity of eight furnaces, six only having been operated for some time. Copper is now at its very highest, so that it is hardly likely a serious shut down will be anticipated. The Dominion Copper Co. is increasing its capacity at the Boundary Falls smelter by adding another copper furnace, the machinery now having arrived. The B.C. Copper Co., which has one large furnace in blast, will probably blow in the second giant furnace in a fortnight, and a third in a few weeks from that. The new furnace of the Dominion Copper Co. is to be the largest of any yet installed, though all of these big Boundary district smelters have very large equipment.

Malleable Works Leaving Branford.

Pratt & Letchworth, who have for some years conducted their Canadian branch at Brantford, doing business on a large scale, have definitely decided to leave that city and locate in Montreal. The company claim local representatives of the Lord's Day Alliance have interfered with the work that is absolutely necessary to be done on Sunday, and hence their decision. The Brantford plant was established in 1890 and has been largely extended since that time. It has now an annual output of $200,000.00, employs over 500 men steadily the year round, and pays $100,000.00 a year in wages. The plant of another company has been secured in Montreal, and although an effort is being made by the city of Brantford to retain them, the officials of Pratt & Letchworth have determined to move their entire operations to Montreal.

Percival Company's Change.

The announcement last week that the Percival Stove & Plow Company, Merrickville, had sold out to the National Manufacturing Company, of Pembroke, was a trifle premature as before the deal was closed T. H. Percival associated with Merrickville and Smith Falls capitalists, arranged to take over the business. The present works at Merrickville will be enlarged and if any move is considered Smiths' Falls will have the first opportunity.

Ontario Lead Enlarging.

The Ontario Lead & Wire Co., Toronto, have sold their white lead and putty plants and stock to the Canada Paint Co., Montreal, and their wire nail plant and stock to the Ontario Tack Co., Hamilton. By dropping out of these lines the Ontario Lead & Wire Co., will be in a position to enlarge their plumbing supply business, all the space formerly devoted to manufacturing being now available for carrying a more complete stock of enamelware and other supplies.

Ingersoll Foundry Changes.

W. J. Telford, of the sales department of the D. Moore Stove Company, Hamilton, and J. A. McCullough, formerly foreman for the Western Foundry Company, Wingham have purchased the Gobey foundry at Ingersoll and intend estimating and taking contracts for all kinds of iron castings. The new firm will be known as the Ingersoll Foundry Co., and, starting at a season when everything is brisk and lively, should soon establish themselves in a large and successful business.
sea.

Zinc Resources of B.C.

The report of the commission appointed by the Dominion Government to investigate the zinc resources of British Columbia and the conditions affecting their commercial exploitation, has been issued. The volume comprises nearly 400 pages, the contents covering a wide scope of matter, historical, statistical and descriptive of the markets for ores, cost and processes of production, mines and smelters working, methods of assaying, etc. Copies of the work can be procured from the Department of Interior, Ottawa.

PERSONAL MENTION

Mr. C. Brandeis, consulting engineer of Montreal, has been appointed consulting engineer to the British North American Lumber Company of Quebec for the installation of an extensive lighting plant.

* * *

Mr. H. Austin, Liverpool manager of Geo. Scott & Son, manufacturing chemical engineers, London, E.C., has been visiting Canada in the interests of his firm, making his headquarters with the Canadian representative, J. A. DeCew, Montreal.

* * *

Mr. George R. Burton, who has been with Lewis Bros., wholesale hardware merchants, Montreal, has resigned from the staff of that firm to become associated with the R. E. T. Pringle Co., manufacturers of electrical apparatus and supplies.

* * *

Mr. David Murphy of the Dominion Bridge Company, who has charge of the construction of the new lift lock on the Trent Valley Canal, was in Montreal recently. Mr. Murphy reports great difficulty in retaining his help, but expects to have the work finished in contract time.

Mr. W. N. Courtney, manager of the Williams Gauge Co's. Canadian branch in Montreal, has returned from a seven weeks' visit at headquarters in Pittsburg. The firm are preparing quarters at 24 St. Peter St., where they will manufacture their products for the Canadian trade. A new office has recently been opened in Toronto, at 64 Wellington St. West, to look after Ontario business.

* * *

At the annual meeting of the shareholders of the Grand Trunk Pacific held at the head offices in Montreal on Nov. 8th a new permanent board of directors were elected as follows :—Sir C. Rivers Wilson, G.C.M.G., C.B., Alfred W. Smithers, Hon. N. Charles Rothschild, Sir Henry Mather Jackson, Bart., Colonel Frederick Firebrace, R.E., of London, Eng., Chas. M. Hays, Frank W. Morse, Wm. Wainwright, E. H. Fitz-Hugh, W. H. Biggar of Montreal ; Hon. Geo. A. Cox, E. R. Wood, of Toronto ; J. R. Booth of Ottawa.

* * *

Packard Electric Gets Good Man.

Mr. H. A. Burson has recently been appointed Chief Engineer of the Packard Electric Co., St. Catharines. The Company are making extensive alterations in their works, not only with a view of increasing the output of their present lines of manufacture necessitated by the rapidly growing demand, but also to add other lines of apparatus which will in due course be offered to the trade. Mr. Parson graduated in Electrical Engineering at McGill in 1901 receiving the degree of B.Sc. and from 1901 to 1903 was demonstrator in the Department of Electrical Engineering under Professor Owens, and received the degree of M.Sc. for original research work. In the spring of 1903 he went to the Bullock Electrical Manufacturing Company at Cincinnati where he was associated with Mr. B. A. Behrend, chief engineer. In 1904 he was appointed Chief Electrical Engineer of the Allis-Chalmers-Bullock, at Montreal. In his capacity as Chief Engineer of the Packard Electric Company, it is safe to assume that, with the assistance of his staff of able and competent shop men, the present products of the Company will be brought up to the highest standard as will also the new lines of apparatus which the Company will shortly put upon the market.

The Continental Life Bldg., Toronto, is being equipped with a compound duplex pumping engine, manufactured by Smart-Turner Machine Co., Hamilton.

Mr. Busy Man

How much time do you devote each day to reading? It is true you are a busy man and have not time to read many publications. If you wish to be up-to-date you must read an up-to-date publication. It is to meet the requirements of busy men like yourself that **The Busy Man's Magazine** is being published.

It ransacks the hundreds of excellent publications you have not the time to read, many of which you never see and reproduces the timely articles every business man wants to read. You are thus furnished each month with 150 pages of the best literature procurable, every article of which will appear to have been written specially for you.

Sent to subscribers to Canadian Machinery for $1.50 a year.

THE

MacLEAN PUBLISHING COMPANY LIMITED

MILLING MACHINE ATTACHMENT.

(Continued from page 458.)

each movement of the crank. Mistakes would very likely occur. In order to obviate the necessity of thus counting the number of holes each time, there is supplied a device known as a sector or spacer, which consists of two hinged blades which swing about the center of the index plate, and that can be set to space off the required number of holes. This device together with the plate is shown in Fig. 4. The plate as will be seen has six circles of holes, all being spaced from an initial radial line as indicated by the arrow. The circles are numbered here according to the number of holes they contain.

The spacer is shown in position for spacing off five holes on the 18 hole circle. The blades are locked in position by the screw S, which bind the nave of one on that of the other when the index pin and crank have been shifted from the hole to the left to that at the right, the spacer is swung around to the position shown by the dotted lines, this is repeated at each indexing. The habit should be formed of doing this as soon as the crank has been turned and set in the proper position, and before going on with the milling as the liability of making mistakes is much lessened by this process.

Additional Light for Montreal.

For years the Montreal Light, Heat & Power Co., have held a monopoly of both electric and gas lighting for that city. A new offer was recently made to supply electric light by the Saraguay Electric Co., at a rate much lower than the citizens of Montreal are now paying. The offer made by this company included three clauses; first a direct offer of three-quarters of a cent per ampere hour, less 35 per cent bonus to the city on the total earnings; third, three-quarters of a cent per ampere hour, less 30 per cent discount, and to impose on the company the same conditions as those imposed on the Montreal Light, Heat & Power Co. The matter has been promised consideration by the mayor of Montreal, and it would look as though that city were to be favored with cheaper light than it has enjoyed for some time. The Saraguay Co., have obtained a twenty-five year light and power franchise for the village of Ahuntsic, and a pumping contract for the water works.

A Promising Industry.

The Canada Forge Co., of Welland, who were recently incorporated under the laws of Ontario with $100,000.00, are rapidly pushing their plant to completion and expect to be manufacturing in the course of a few weeks. It was decided to locate in Welland on account of various advantages. The plant was primarily established to take care of Canadian trade, and is the first plant in Canada modernly equipped for the manufacture of steel forgings exclusively. Every description of open hearth steel forgings from 10 to 10,000 lbs. in weight in rough or finished state, will be made by the company; who willi make, a specialty of crank shafts and connecting rods for marine and stationary engines. The machine shop will be run by electric power from Niagara, and will be

equipped with the latest design of machinery to take care of forgings which are neeessarily of a heavy type. Raw material will be supplied from the plant of the Ontario Iron & Steel Co., in Welland. This company is closely affiliated with the Titusville Forge Co., Titusville, Pa., who have built up a large trade in this line of manufacture. The Canada Forge Co. are now ready to accept orders and expect to deliver goods by the latter part of the month of January, 1907.

Lumen Co.'s New Foundry

The Lumen Bearing Co. is about to move their Canadian foundry now located at 114 Jarvis St., Toronto, to a modern foundry equipped especially for their work at Toronto Junction, where they will have a capacity for 7,000 pounds per day of castings, and will have the necessary crane equipment, etc., for handling castings up to three thousand pounds. They will continue to make their well-known Lumen bronze as well as maganese bronze brass and aluminum castings. They expect to be completely installed the first of the new year.

The Best Rocky Mountain Pass

Engineers completing the surveys through the mountains from Edmonton for the Grand Trunk Pacific Railway, claim that no other pass is anything like as favorable as the Yellowhead, through which the Grand Trunk Pacific will run. The Yellowhead Pass is described as a park and the grade will in no place exceed one per cent. The heaviest grade from the eastern side is but 85-100 of one per cent, but in mountain railroading this is very low.

New Plant for Goderich

Engineer J. B. Kelly, Goderich, has recommended to the council the replacing of the present electric lighting apparatus with an entirely new one, involving the purchase of a new generator, switch-board, regulator for arc lights, shafting, and the construction of new foundations for boilers. Mr. Kelly has beeen asked by the council to go to Berlin, to investigate the merits of the producer gas engine, but should it be decided not to adopt this, then a new boiler, air-pump, condenser, etc., will have to be purchased to replace part of the present apparatus. The council will also seek the advice of Supt. McKenzie, of the Swift Co., New York City, who has had experience with the producer gas engine. After this year the water and light affairs of Goderich will probably be in the hands of a paid commission, the question is being voted on at New Years'.

New Mining Operations

Communication from Canadian Machinery's correspondent in the mining district of British Columbia, gives information of the Cariboo McKinney Mine, located at Camp McKinney, B.C., being opened up for active operations under a lease. Work has been commenced with a small force of men, which will be increased as the mine is placed in working order. The Cariboo McKinney is a quartz gold mine and is a stamp mill proposition. The equipment of the mine consists of a 10 drill compressor, a twenty stamp mill and a Scanide plant. Mr. George Cole, B.Sc., has accepted the position of assistant mining engineer of this mine, and under his direction it is anticipated there will be a boom in operation in that locality.

The Sight for G.T.P. Shops

A site for the Winnipeg shops of the Grand Trunk Pacific Railway has been secured consisting of 300 acres, located in block F St. Boniface. Large and commodious shops will be built at this point, of modern design and equipped in a most up-to-date manner. The Canadian Northern and the Grand Trunk Pacific have decided to build a Union Depot at Winnipeg, which will be one of the finest terminal depots on the American continent.

Another Industry for Berlin

The industrial committee and the town council of Berlin, Ont., are negotiating to have a large plant started in that city for the manufacture of agricultural machinery. The company propose investing $300,000.00 in the erection and equipment of this industry. A site comprising 10 acres of land has been selected in close proximity to the G.T.R. and C.P.R. It is purposed to employ 200 hands during the first year. No definite arrangements have as yet been concluded.

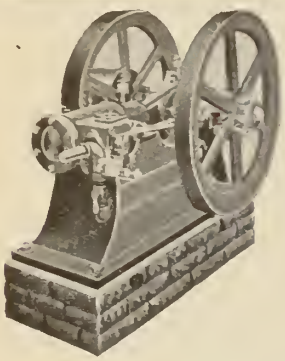
An intelligent Engineer uses nothing but the GENUINE PENBERTHY INJECTOR. He has had experience with just-as-good kind before.



Sylvester Gasoline Engines

Are the best that skilled labor can produce.

They are easy starting; they are simple and reliable; they will give full power in the coldest weather. Made in sizes from 4 to 32 horse power in portable snd stationary and from 1½ to 12 horse power in marine. They will run on gasoline, coal oil or distillates.

The SYLVESTER Engine inspires confidence because it is so simple in construction. It is the cheapest engine to buy because there is nothing to get out of order.

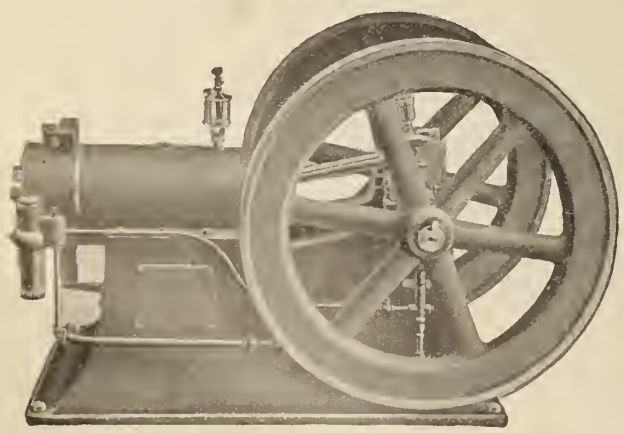
The SYLVESTER Engine is handsome in appearance, substantial in construction, marvelous in simplicity, unequalled for effectiveness and durability.

THE HIGHEST AND MOST PERFECT TYPE OF GASOLINE ENGINE BUILT.

If you require to purchase, write for Catalogue and our 1906 Calendar. We will then send our Travelling Salesman to you.

THE SYLVESTER MFG. CO., Limited, - - LINDSAY, ONT.

The Famous McVicker



One third the number of parts.

The only four cycle engine that will run either way.

The only improvement in gas engines for forty years.

Governor ten times as sensative as any other. No gears, cams, eccentrics or trigger work of any kind.

The Canadian McVicker Engine Company LIMITED

GRAPHITE PAINTS

ISLAND CITY

MACHINE PAINTS

It is well known that Graphite makes one of the best paints as a preservative of exposed metal work. It is the best paint to use for iron castings or girders on account of its filling properties thereby giving it a good covering.

BESIDES the ordinary, our machine paints are made in paste form and can be used as a filler, applied with a knife or thinned with turpentine and brushed on, spreads freely and leaves a good surface.

ASK US FOR ONE OF OUR CATALOGUES

P. D. DODS & CO., Montreal and Toronto

Have You Any Use For a Dictionary That Contains Definitions of About 5,000 Distinct Words, Terms, and Phrases Employed in the Practice of Electrical Engineering?

No matter whether you are an expert electrical engineer, or an every-day electrical workman, your answer cannot be other than "yes"—unless you already have a copy.

When you know that the dictionary of which we are speaking is called

STANDARD ELECTRICAL DICTIONARY

and is compiled by no less renowned an authority than Prof. T. O'Conor Sloane, you will readily understand why ten editions of the book have been issued.

In his preface the author says: "The science [electrical] has expanded so much that the limits of what may be termed strictly a dictionary of the present day, would a few years ago have sufficed for an encyclopedia." **There you have an idea of the scope of the "Standard Electrical Dictionary."**

Again: "Each title or subject is defined once in the text. Where a title is synonymous with one or more others, the definition is given under one title and the others appear at the foot of the article as synonyms. It may be that the reader is seeking the definition of one of these synonyms. If so, a reference to the index shows him at once what page contains the information sought for. . . . . Where a title embraces several words, all orders of the word will be cited in the index." **There you have an idea of the serviceability of the "Standard Electrical Dictionary."**

There are 682 pages, 393 illustrations, and the price (postpaid) is

$3.00

ATTENTION TO THE SMALL EXPENSES MEANS AN INCREASE IN PROFITS

Is there not a possibility for some saving in your business? For instance, how about the cost of cleaning your castings, etc.?

Investigate. Be sure that this work is being done as well and as economically as it can be. Don't clean your castings by hand methods. Life's too short. Be up-to-date. Use an **"Economy" Steel Wire Wheel Brush.** A great labor-saver. Does the work of five men. For every piece of work you finish by hand methods, your competitor with an **"Economy" Brush** is doing five times as much in the same time, and it's better work, too.

A customer, who has been using "ECONOMY" BRUSHES for the past six years, writes:

Your ***"Economy" Wire Wheel Brushes*** enable us to get CLEANER CASTINGS and a MUCH BETTER FINISH on our goods, and at a LESS COST than by any other method. We have tried other methods and other wheel brushes, but have not found anything from which we can get equal results. ***Hundreds of users of "Economy" Wheel Brushes will tell you the same.***

ASK FOR BOOKLET No. 13

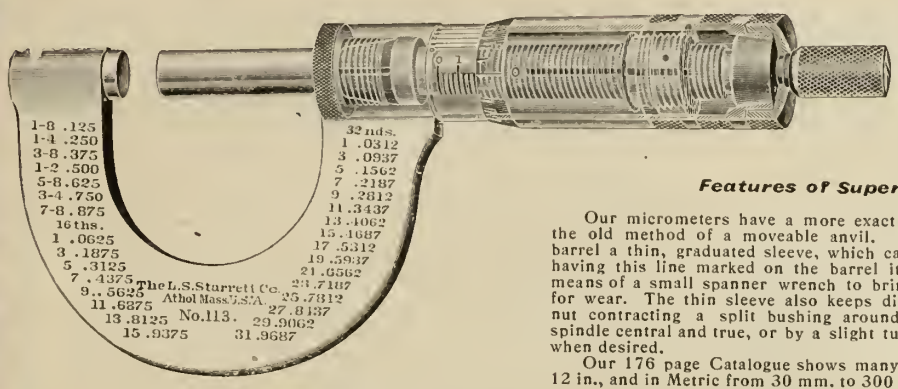
STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH



Starrett Micrometers

Features of Superiority—Patented

Our micrometers have a more exact and easier way of adjustment than by the old method of a moveable anvil. This is obtained by placing over the barrel a thin, graduated sleeve, which carries the base or zero line, instead of having this line marked on the barrel itself. This sleeve may be turned by means of a small spanner wrench to bring the zero line correct to compensate for wear. The thin sleeve also keeps dirt from the screw. A knurled locking nut contracting a split bushing around the spindle tightens and keeps the spindle central and true, or by a slight turn locks it firm, making a solid gauge when desired.

Our 176 page Catalogue shows many styles of Micrometers, from ½ in. to 12 in., and in Metric from 30 mm. to 300 mm.

THE GEOMETRIC IMPROVED REVERSING TAP HOLDER

is designed for use on either a drill press or lathe, being applied in the same manner as an ordinary drill chuck. Reverses automatically, with return speed three times that of cutting. Any style of hand tap can be used in these Tap Hoiders, and they are so sensitive in action as to overcome the breakage so objectionable to other appliances of this kind now on the market.

Manufacturers requiring a tool of this class will find it a profit producer.

We are glad to send these tools out on trial to responsible parties.

Write for circular.

INDEXED CASE FOR DRILLS.

We know that every man who uses drills, is interested in these cases the moment they are brought to his attention. The wooden cylindrical case is mahogany—as you know a handsome wood—the metal top and knobs are nickel-plated. It is a handsome little case, but that is secondary to its usefulness which was the first thing aimed at. Drills kept in these cases are always ready for use, they are not mislaid, nor does anyone borrow them without your knowledge. It takes but a moment to turn the cover, swing the shutter by means of the knob, and out comes the drill.

Order one and then you will advise your friend to order one. Remember it is "*Morse Goods*," which guarantees the quality.

ENGINEERING:

AN ILLUSTRATED WEEKLY JOURNAL

Edited by WILLIAM H. MAW and JAMES DREDGE

PRICE SIXPENCE.

"ENGINEERING," besides a great variety of Illustrated Articles relating to Civil, Mechanical, Electrical and Military Engineering and Notes of General Professional Interest, devotes a considerable space in each issue to the illustration and description of all matters connected with the PRACTICAL APPLICATION OF PHYSICAL SCIENCE, and with its Wide and Influential Circulation in all parts of the world, this Journal is an

UNRIVALLED MEDIUM FOR ADVERTISEMENTS

SUBSCRIPTIONS (Home, Foreign and Colonial)

"ENGINEERING" can be supplied, direct from the Publisher, post free for Twelve Months, at the following rates, **payable in advance**:—

For the United Kingdom - - - - - - £1 9 2

For all places abroad:—

Thin Paper Copies - - - - - £1 16 0

Thick " - - - - - £2 0 6

Subscribers residing abroad are strongly recommended to order copies on thick paper, as the illustrations are necessarily very much less effective in the thin paper edition, and to remit, when possible, by Post Office Order made payable at Bedford Street, Strand, London, W.C. When Foreign Subscriptions are so forwarded, advice should be sent to the Publisher.

Foreign and Colonial Subscribers receiving Incomplete Copies through Newsagents are requested to communicate the fact to the Publisher, together with the Agent's Name and Address.

Cheques should be crossed "Union of London and Smiths Bank, Limited, Charing Cross Branch."

All accounts are payable to "ENGINEERING, LIMITED."

ADVERTISEMENTS.

Prepaid Advertisements on Wrapper, **classified** under headings: Tenders—Appointments Open—Situations Wanted—Partnerships—Wanted, &c.—For Sale—Auction Sales—Publications—Miscellaneous—Patent Agents—&c.

By the Line—Four Lines or under, 3s., each additional Line, 8d. The Line averages Seven Words.

By the Inch—8s. per Inch Single Column, One Insertion.
